there is no mention in the dream of the fact that the dead man is dead, the dreamer is equating himself with him: he is dreaming of his own death. If, in the course of the dream, the dreamer suddenly says to himself in astonishment, 'why, he died ever so long ago', he is repudiating this equation and is denying that the dream signifies his own death.[1] – But I willingly confess to a feeling that dream interpretation is far from having revealed all the secrets of dreams of this character.

III

In the example which I shall next bring forward I have been able to catch the dream-work in the very act of intentionally fabricating an absurdity for which there was absolutely no occasion in the material. It [432] is taken from the dream which arose from my meeting with Count Thun as I was starting for my holidays. [See p. 184 ff. above.] *I was driving in a cab and ordered the driver to drive me to a station. 'Of course I can't drive with you along the railway line itself,' I said, after he had raised some objection, as though I had overtired him. It was as if I had already driven with him for some of the distance one normally travels by train.* The analysis produced the following explanations of this confused and senseless story. The day before, I had hired a cab to take me to an out-of-the-way street in Dornbach.[2] The driver, however, had not known where the street was and, as these excellent people are apt to do, had driven on and on until at last I had noticed what was happening and had told him the right way, adding a few sarcastic comments. A train of thought, to which I was later in the analysis to return, led from this cab driver to aristocrats. For the moment it was merely the passing notion that what strikes us bourgeois plebs about the aristocracy is the preference they have for taking the driver's seat. Count Thun, indeed, was the driver of the state coach of Austria. The next sentence in the dream, however, referred to my brother, whom I was thus identifying with the cab driver. That year I had called off a trip I was going to make with him to Italy. ('*I can't drive with you along the railway line itself.*') And this cancellation had been a kind of punishment for the complaints he used to make that I was in the habit of *overtiring* him on such trips (this appeared in the dream unaltered) by insisting upon moving too rapidly from place to place and seeing too many beautiful things in a single day. On the evening of the dream my brother had accompanied me to the

1 [This point was first made in Freud (1913*h*).]

2 [On the outskirts of Vienna.]

station; but he had jumped out shortly before we got there, at the suburban railway station adjoining the main line terminus, in order to travel to Purkersdorf[1] by the suburban line. I had remarked to him that he might have stayed with me a little longer by travelling to Purkersdorf by the main line instead of the suburban one. This led to the passage in the dream in which I drove in the cab *for some of the distance one normally travels by train*. This was an inversion of what had happened in reality – a kind of '*tu quoque*' argument. What I had said to my brother was: 'you can travel on the main line in my company for the
[433] distance you would travel by the suburban line.' I brought about the whole confusion in the dream by putting 'cab' instead of 'suburban line' (which, incidentally, was of great help in bringing together the figures of the cab driver and my brother). In this way I succeeded in producing something senseless in the dream, which it seems scarcely possible to disentangle and which was almost a direct contradiction of an earlier remark of mine in the dream ('*I can't drive with you along the railway line itself*'). Since, however, there was no necessity whatever for me to confuse the suburban railway and a cab, I must have arranged the whole of this enigmatic business in the dream on purpose.

But for *what* purpose? We are now to discover the significance of absurdity in dreams and the motives which lead to its being admitted or even created. The solution to the mystery in the present dream was as follows. It was necessary for me that there should be something absurd and unintelligible in this dream in connection with the word '*fahren*'[2] because the dream thoughts included a particular judgement which called for representation. One evening, while I was at the house of the hospitable and witty lady who appeared as the 'housekeeper' in one of the other scenes in the same dream, I had heard two riddles which I had been unable to solve. Since they were familiar to the rest of the company, I cut a rather ludicrous figure in my vain attempts to find the answers. They depended upon puns on the words '*Nachkommen*' and '*Vorfahren*' and, I believe, ran as follows:

Der Herr befiehlt's,
Der Kutscher tut's.
Ein jeder hat's,
Im Grabe ruht's.

1 [Seven or eight miles outside Vienna.]

2 [The German word '*fahren*', which has already been used repeatedly in the dream and the analysis, is used for the English 'drive' (in a cab) and 'travel' (on a train) and has had to be translated by both of those words in different contexts. See also p. 186 *n*. 2 above.]

[With the master's request
The driver complies:
By all men possessed
In the graveyard it lies.]

(Answer: '*Vorfahren*' ['Drive up' and 'Ancestry'; more literally 'go in front' and 'predecessors'].)

It was particularly confusing that the first half of the second riddle was identical with that of the first: [434]

Der Herr befiehlt's,
Der Kutscher tut's.
Nicht jeder hat's,
In der Wiege ruht's.

[With the master's request
The driver complies:
Not by all men possessed
In the cradle it lies.]

(Answer: '*Nachkommen*' ['Follow after' and 'Progeny'; more literally 'come after' and 'successors'].)

When I saw Count Thun *drive up* so impressively and when I thereupon fell into the mood of Figaro, with his remarks on the goodness of great gentlemen in having taken the trouble to be born (to become *progeny*), these two riddles were adopted by the dream-work as intermediate thoughts. Since aristocrats could easily be confused with drivers and since there was a time in our part of the world when a driver was spoken of as '*Schwager*' ['coachman' and 'brother-in-law'], the work of condensation [*Verdichtungsarbeit*] was able to introduce my brother into the same picture. The dream thought, however, which was operating behind all this ran as follows: 'It is absurd to be proud of one's ancestry; it is better to be an ancestor oneself.' This judgement, that something 'is absurd', was what produced the absurdity in the dream. And this also clears up the remaining enigma in this obscure region of the dream, namely why it was that I thought I had already driven with the driver *before* [*vorhergefahren* ('driven before') – *vorgefahren* ('driven up') – '*Vorfahren*' ('ancestry')].

A dream is made absurd, then, if a judgement that something 'is absurd' is among the elements included in the dream thoughts – that is to say, if any one of the dreamer's unconscious trains of thought has criticism

or ridicule as its motive. Absurdity is accordingly one of the methods by which the dream-work represents a contradiction – alongside such other methods as the reversal in the dream content of some material relation in the dream thoughts [p. 290 f. above], or the exploitation of the sensation of motor inhibition [p. 300 f.]. Absurdity in a dream, however, is not to be translated by a simple 'no'; it is intended to reproduce
[435] the *mood* of the dream thoughts, which combines derision or laughter with the contradiction. It is only with such an aim in view that the dream-work produces anything ridiculous. Here once again *it is giving a manifest form to a portion of the latent content*.[1]

Actually we have already come across a convincing example of an absurd dream with this kind of meaning: the dream – I interpreted it without any analysis – of the performance of a Wagner opera which lasted till a quarter to eight in the morning and in which the orchestra was conducted from a tower, and so on (see p. 306 f.). It evidently meant to say: 'This is a *topsy-turvy* world and a *crazy* society; the person who deserves something doesn't get it, and the person who doesn't care about something *does* get it' – and there the dreamer was comparing her fate with her cousin's. – Nor is it by any means a matter of chance that our first examples of absurdity in dreams related to a dead father. In such cases, the conditions for creating absurd dreams are found together in characteristic fashion. The authority wielded by a father provokes criticism from his children at an early age, and the severity of the demands he makes upon them leads them, for their own relief, to keep their eyes open to any weakness of their father's; but the filial piety called up in our minds by the figure of a father, particularly after his death, tightens the censorship which prohibits any such criticism from being consciously expressed.

1 The dream-work is thus parodying the thought that has been presented to it as something ridiculous, by the method of creating something ridiculous in connection with that thought. Heine adopted the same line when he wanted to ridicule some wretched verses written by the King of Bavaria. He did so in still more wretched ones:

Herr Ludwig ist ein grosser Poet,
Und singt er, so stürzt Apollo
Vor ihm auf die Kniee und bittet und fleht,
'Halt ein! ich werde sonst toll, o!'

[Sir Ludwig is a magnificent bard
And, as soon as he utters, Apollo
Goes down on his knees and begs him: 'Hold hard!
Or I'll shortly become a clod-poll oh!'
Lobgesänge auf König Ludwig, I.]

IV

Here is another absurd dream about a dead father. *I received a communication from the town council of my birthplace concerning the fees due for someone's maintenance in the hospital in the year 1851, which had been necessitated by an attack he had had in my house. I was amused by this since, in the first place, I was not yet alive in 1851 and, in the second place, my father, to whom it might have related, was already dead. I went to him in the next room, where he was lying on his bed, and told him about it. To my surprise, he recollected that in 1851 he had once got drunk and had had to be locked up or detained. It was at a time at which he had been working for the firm of T——. 'So you used to drink as well?' I asked; 'did you get married soon after that?' I calculated that, of course, I was born in 1856, which seemed to be the year which immediately followed the year in question.* [436]

We should conclude from the preceding discussion that the insistence with which this dream exhibited its absurdities could only be taken as indicating the presence in the dream thoughts of a particularly embittered and passionate polemic. We shall therefore be all the more astonished to observe that in this dream the polemic was carried on in the open and that my father was the explicit object of the ridicule. Openness of this kind seems to contradict our assumptions as regards the working of the censorship in connection with the dream-work. The position will become clearer, however, when it is realized that in this instance my father was merely put forward as a show-figure, and that the dispute was really being carried on with someone else, who only appeared in the dream in a single allusion. Whereas normally a dream deals with rebellion against someone else, behind whom the dreamer's father is concealed, the opposite was true here. My father was made into a man of straw, in order to screen someone else; and the dream was allowed to handle in this undisguised way a figure who was as a rule treated as sacred, because at the same time I knew with certainty that it was not he who was really meant. That this was so was shown by the exciting cause of the dream. For it occurred after I had heard that a senior colleague of mine, whose judgement was regarded as beyond criticism, had given voice to disapproval and surprise at the fact that the psychoanalytic treatment of one of my patients had already entered its *fifth year*.[1] The first sentences of the dream alluded under a transparent [437]

1 [This was the patient frequently referred to in Freud's letters to Fliess (Freud, 1950*a*) as 'E'. The present dream is referred to in Letter 126 (December 21, 1899) and the very satisfactory termination of the treatment is announced in Letter 133 (April 16, 1900).]

disguise to the fact that for some time this colleague had taken over the duties which my father could no longer fulfil ('*fees due*', '*maintenance in the hospital*'), and that, when our relations began to be less friendly, I became involved in the same kind of emotional conflict which, when a misunderstanding arises between a father and son, is inevitably produced owing to the position occupied by the father and the assistance formerly given by him. The dream thoughts protested bitterly against the reproach that I was *not getting on faster* – a reproach which, applying first to my treatment of the patient, extended later to other things. Did he know anyone, I thought, who could get on more quickly? Was he not aware that, apart from my methods of treatment, conditions of that kind are altogether incurable and last a lifetime? What were *four or five years* in comparison with a whole lifetime, especially considering that the patient's existence had been so very much eased during the treatment?

A great part of the impression of absurdity in this dream was brought about by running together sentences from different parts of the dream thoughts without any transition. Thus the sentence '*I went to him in the next room*', etc., dropped the subject with which the preceding sentences had been dealing and correctly reproduced the circumstances in which I informed my father of my having become engaged to be married without consulting him. This sentence was therefore reminding me of the admirable unselfishness displayed by the old man on that occasion, and contrasting it with the behaviour of someone else – of yet another person. It is to be observed that the dream was allowed to ridicule my father because in the dream thoughts he was held up in unqualified admiration as a model to other people. It lies in the very nature of every censorship that of forbidden things it allows those which are *untrue* to be said rather than those which are *true*. The next sentence, to the effect that he recollected '*having once got drunk and been locked up for it*', was no longer concerned with anything that related to my father in reality. Here the figure for whom he stood was no less a person than the great Meynert,[1] in whose footsteps I had trodden with such deep veneration and whose behaviour towards me, after a short period of favour, had turned to undisguised hostility.
[438] The dream reminded me that he himself had told me that at one time in his youth he had indulged in the habit of making himself *intoxicated with chloroform* and that on account of it he had had to go into a *home*. It also reminded me of another incident with him shortly before

1 [Theodor Meynert (1833–92) had been Professor of Psychiatry at the Vienna University.]

his death. I had carried on an embittered controversy with him in writing, on the subject of male hysteria, the existence of which he denied.[1] When I visited him during his fatal illness and asked after his condition, he spoke at some length about his state and ended with these words: 'You know, I was always one of the clearest cases of male hysteria.' He was thus admitting, to my satisfaction and astonishment, what he had for so long obstinately contested. But the reason why I was able in this scene of the dream to use my father as a screen for Meynert did not lie in any analogy that I had discovered between the two figures. The scene was a concise but entirely adequate representation of a conditional sentence in the dream thoughts, which ran in full: 'If only I had been the second generation, the son of a professor or Hofrat, I should certainly have *got on faster*.' In the dream I made my father into a Hofrat and professor. – The most blatant and disturbing absurdity in the dream resides in its treatment of the date 1851, which seemed to me not to differ from 1856, *just as though a difference of five years was of no significance whatever*. But this last was precisely what the dream thoughts sought to express. *Four or five years* was the length of time during which I enjoyed the support of the colleague whom I mentioned earlier in this analysis; but it was also the length of time during which I made my fiancée wait for our marriage; and it was also, by a chance coincidence which was eagerly exploited by the dream thoughts, the length of time during which I made my patient of longest standing wait for a complete recovery. '*What are five years?*' asked the dream thoughts; '*that's no time at all, so far as I'm concerned; it doesn't count*. I have time enough in front of me. And just as I succeeded in the end in *that*, though you would not believe it, so I shall achieve *this*, too.' Apart from this, however, the number 51 by itself, without the number of the century, was determined in another, and indeed, in an opposite sense; and this, too, is why it appeared in the dream several times. 51 is the age which seems to be a particularly dangerous one to men; I have known colleagues who have died suddenly at that age, and among them one who, after long delays, had been appointed to a professorship only a few days before his death.[2] [439]

1 [This controversy is described in some detail in the first chapter of Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 12–13.]

2 [This is no doubt a reference to Fliess's theory of periodicity. 51 = 28 + 23, the female and male periods respectively. Cf. Sections I and IV of Kris's introduction to Freud's correspondence with Fliess (Freud, 1950*a*). Cf. also a passage (cancelled by Freud from 1907 onwards) in Chapter XII A (7) of *The Psychopathology of Everyday Life* (1901*b*), reproduced in *RSE*, **6**, 215 *n*. 3. See also above, p. 147 ff. – The fact that the number 51 occurs several times is referred to on p. 459 below. The analysis of the dream is continued below on p. 401 ff.]

V

Here is yet another absurd dream which plays about with numbers. *One of my acquaintances, Herr M., had been attacked in an essay with an unjustifiable degree of violence, as we all thought – by no less a person than Goethe. Herr M. was naturally crushed by the attack. He complained of it bitterly to some company at table; his veneration for Goethe had not been affected, however, by this personal experience. I tried to throw a little light on the chronological data, which seemed to me improbable. Goethe died in 1832. Since his attack on Herr M. must naturally have been made earlier than that, Herr M. must have been quite a young man at the time. It seemed to be a plausible notion that he was eighteen. I was not quite sure, however, what year we were actually in, so that my whole calculation melted into obscurity. Incidentally, the attack was contained in Goethe's well-known essay on 'Nature'.*

We shall quickly find means of justifying the nonsense in this dream. Herr M., whom I had got to know among some *company at table*, had not long before asked me to examine his brother, who was showing signs of *general paralysis*. The suspicion was correct; on the occasion of this visit an awkward episode occurred, for in the course of his conversation the patient for no accountable reason gave his brother away by talking of his *youthful follies*. I had asked the patient the year of his birth and made him do several small sums so as to test the weakness of his memory – though, incidentally, he was still able to meet the tests quite well. I could already see that I myself behaved like a paralytic in the dream. (*I was not quite sure what year we were in*.) Another part of the material of the dream was derived from another recent source. The editor of a medical journal [the *Wiener klinische Rundschau*], with whom I was on friendly terms, had printed a highly unfavourable, a '*crushing*' criticism of my Berlin friend Fl.'s [Fliess's] last book. The criticism had been written by a very *youthful* reviewer [440] who possessed small judgement. I thought I had a right to intervene and took the editor to task over it. He expressed lively regret at having published the criticism but would not undertake to offer any redress. I therefore severed my connection with the journal, but in my letter of resignation expressed a hope that *our personal relations would not be affected by the event*. The third source of the dream was an account I had just heard from a woman patient of her brother's mental illness, and of how he had broken out in a frenzy with cries of '*Nature!*

Nature!' The doctors believed that his exclamation came from his having read *Goethe's* striking essay on that subject and that it showed he had been overworking at his studies in natural philosophy. I myself preferred to think of the sexual sense in which the word is used even by the less educated people here. This idea of mine was at least not disproved by the fact that the unfortunate young man subsequently mutilated his own genitals. *He was eighteen* at the time of his outbreak.

I may add that my friend's book which had been so severely criticized ('one wonders whether it is the author or oneself who is crazy', another reviewer had said) dealt with the *chronological data* of life and showed that the length of *Goethe's* life was a multiple of a number [of days] that has a significance in biology. So it is easy to see that in the dream I was putting myself in my friend's place. (*I tried to throw a little light on the chronological data*.) But I behaved like a paralytic, and the dream was a mass of absurdities. Thus the dream thoughts were saying ironically: '*Naturally*, it's *he* [my friend Fl.] who is the crazy fool, and it's *you* [the critics] who are the men of genius and know better. Surely it can't by any chance be the reverse?' There were plenty of examples of this *reversal* in the dream. For instance, Goethe attacked the young man, which is absurd, whereas it is still easy for quite a young man to attack Goethe, who is immortal. And again, I calculated from the year of Goethe's *death*, whereas I had made the paralytic calculate from the year of his *birth*. [See p. 291 above, where this dream has already been mentioned.]

But I have also undertaken to show that no dream is prompted by motives other than egoistic ones. [See p. 237 ff.] So I must explain away the fact that in the present dream I made my friend's cause my own and put myself in his place. The strength of my critical conviction in waking life is not enough to account for this. The story of the eighteen-year-old [441]
patient, however, and the different interpretations of his exclaiming '*Nature!*' were allusions to the opposition in which I found myself to most doctors on account of my belief in the sexual aetiology of the psychoneuroses. I could say to myself: 'The kind of criticism that has been applied to your friend will be applied to you – indeed, to some extent it already *has* been.' The 'he' in the dream can therefore be replaced by 'we': 'Yes, you're quite right, it's *we* who are the fools.' There was a very clear reminder in the dream that '*mea res agitur*', in the allusion to Goethe's short but exquisitely written essay; for when at the end of my schooldays I was hesitating in my choice of a career,

it was hearing that essay read aloud at a public lecture[t] that decided me to take up the study of natural science.[1]

VI

Earlier in this volume I undertook to show that another dream in which my own ego did not appear was nevertheless egoistic. On p. 238 f. I reported a short dream to the effect that Professor M. said: '*My son, the Myops . . .*', and I explained that the dream was only an introductory one, preliminary to another in which I *did* play a part. Here is the missing main dream, which introduces an absurd and unintelligible verbal form which requires an explanation.

*On account of certain events which had occurred in the city of Rome, it had become necessary to remove the children to safety, and this was done. The scene was then in front of a gateway, double doors in the ancient style (the 'Porta Romana' at Siena, as I was aware during the dream itself). I was sitting on the edge of a fountain and was greatly depressed and almost in tears. A female figure – an attendant or nun – brought two boys out and handed them over to their father, who was not myself. The elder of the two was clearly my eldest son; I did not see the other one's face. The woman who brought out the boy asked him to kiss her goodbye. She was noticeable for having a red nose. The boy refused to kiss her, but, holding out his hand in farewell, said '*AUF GESERES*' to her, and then '*AUF UNGESERES*' to the two of us (or to*
[442] *one of us). I had a notion that this last phrase denoted a preference.*[2]

This dream was constructed on a tangle of thoughts provoked by a play which I had seen, called *Das neue Ghetto* [*The New Ghetto*]. The Jewish problem, concern about the future of one's children, to whom one cannot give a country of their own, concern about educating them in such a way that they can move freely across frontiers – all of this was easily recognizable among the relevant dream thoughts.

'*By the waters of Babylon we sat down and wept*.' Siena, like Rome, is famous for its beautiful fountains. If Rome occurred in one of my dreams, it was necessary for me to find a substitute for it from some

1 [This dream is further discussed on p. 400 f. below; it is also analysed at length, and with a few additional details, in Part VI of Freud's short study *On Dreams* (1901*a*), *RSE*, **5**, 597 ff. – An English translation of Goethe's 'Fragment über die Natur' can be found in Wittels (1931, 31). R. Pestalozzi, writing in the *Neue Zürcher Zeitung*, July 1, 1956 (Bl. 5), has shown that the essay was not, in fact, by Goethe but by a Swiss writer, G. C. Tobler. See also Section I of Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 6 and *n.* 5.]

2 [The words '*Geseres*' and '*Ungeseres*', neither of them German, are discussed below.]

locality known to me (see p. 171 f.). Near the Porta Romana in Siena we had seen a large and brightly lighted building. We learnt that it was the *Manicomio*, the insane asylum. Shortly before I had the dream I had heard that a man of the same religious persuasion as myself had been obliged to resign the position which he had painfully achieved in a state asylum.

Our interest is aroused by the phrase '*Auf Geseres*' (at a point at which the situation in the dream would have led one to expect '*Auf Wiedersehen*') as well as its quite meaningless opposite '*Auf Ungeseres*'. According to information I have received from philologists, '*Geseres*' is a genuine Hebrew word derived from a verb '*goiser*', and is best translated by 'imposed sufferings' or 'doom'. The use of the word in slang would incline one to suppose that it meant 'weeping and wailing'. '*Ungeseres*' was a private neologism of my own and was the first word to catch my attention, but to begin with I could make nothing of it. But the short remark at the end of the dream to the effect that '*Ungeseres*' denoted a preference over '*Geseres*' opened the door to associations and at the same time to an elucidation of the word. An analogous relationship occurs in the case of caviare; *unsalted* ['*ungesalzen*'] caviare is esteemed more highly than *salted* ['*gesalzen*']. 'Caviare to the general', aristocratic pretensions; behind this lay a joking allusion to a member of my household who, since she was younger than I, would, I hoped, look after my children in the future. This tallied with the fact that another member of my household, our excellent nurse, was recognizably portrayed in the [443]
female attendant or nun in the dream. There was still, however, no transitional idea between '*salted – unsalted*' and '*Geseres – Ungeseres*'. This was provided by '*leavened – unleavened*' ['*gesäuert – ungesäuert*']. In their flight out of Egypt the Children of Israel had not time to allow their dough to rise and, in memory of this, they eat unleavened bread to this day at Easter. At this point I may insert a sudden association that occurred to me during this portion of the analysis. I remembered how, during the previous Easter, my Berlin friend and I had been walking through the streets of Breslau, a town in which we were strangers. A little girl asked me the way to a particular street, and I was obliged to confess that I did not know; and I remarked to my friend: 'It is to be hoped that when she grows up that little girl will show more discrimination in her choice of the people whom she gets to direct her.' Shortly afterwards, I caught sight of a door plate bearing the words 'Dr Herodes. Consulting hours: . . .' 'Let us hope', I remarked, 'that our colleague does not happen to be a children's doctor.' At this same time my friend

had been telling me his views on the biological significance of *bilateral symmetry* and had begun a sentence with the words 'If we had an eye in the middle of our foreheads like a Cyclops . . .' This led to the Professor's remark in the introductory dream, '*My son, the Myops* . . .'[1] and I had now been led to the principal source of '*Geseres*'. Many years before, when this son of Professor M's., today an independent thinker, was still sitting at his school desk, he was attacked by a disease of the eyes which, the doctor declared, gave cause for anxiety. He explained that so long as it remained *on one side* it was of no importance, but that if it passed over to the *other eye* it would be a serious matter. The affection cleared up completely in the one eye; but shortly afterwards signs in fact appeared of the other one being affected. The boy's mother, terrified, at once sent for the doctor to the remote spot in the country where they were staying. The doctor, however, now went over *to the other side*. 'Why are you making such a "*Geseres*"?' he shouted at the mother, 'if *one* side has got well, so will the *other*.' And he was right.

And now we must consider the relation of all this to me and my family. The school desk at which Professor M.'s son took his first steps in [444] knowledge was handed over by his mother as a gift to my eldest son, into whose mouth I put the farewell phrases in the dream. It is easy to guess one of the wishes to which this transference gave rise. But the construction of the desk was also intended to save the child from being *short-sighted* and *one-sided*. Hence the appearance in the dream of '*Myops*' (and, behind it, '*Cyclops*') and the reference to *bilaterality*. My concern about one-sidedness had more than one meaning: it could refer not only to physical one-sidedness but also to one-sidedness of intellectual development. May it not even be that it was precisely this concern which, in its crazy way, the scene in the dream was contradicting? After the child had turned to *one side* to say farewell words, he turned to the *other side* to say the contrary, as though to restore the balance. *It was as though he was acting with due attention to bilateral symmetry!*

Dreams, then, are often most profound when they seem most crazy. In every epoch of history those who have had something to say but could not say it without peril have eagerly assumed a fool's cap. The audience at whom their forbidden speech was aimed tolerated it more easily if they could at the same time laugh and flatter themselves with the reflection that the unwelcome words were clearly nonsensical. The prince in the play, who had to disguise himself as a madman, was behaving just as dreams do in reality; so that we can say of dreams what

1 [The German '*Myop*' is an *ad hoc* form constructed on the pattern of '*Zyklop*'.]

Hamlet said of himself, concealing the true circumstances under a cloak of wit and unintelligibility: 'I am but mad north-north-west: when the wind is southerly, I know a hawk from a hand-saw!'[1]

Thus I have solved the problem of absurdity in dreams by showing that the dream thoughts are never absurd – never, at all events, in the dreams of sane people – and that the dream-work produces absurd dreams and dreams containing individual absurd elements if it is faced with the necessity of representing any criticism, ridicule or derision which may be present in the dream thoughts.[2] [445]

My next task is to show that the dream-work consists in nothing more than a combination of the three factors I have mentioned[3] – and of a fourth which I have still to mention [see p. 437 below]; that it carries out no other function than the translation of dream thoughts in accordance with the four conditions to which it is subject; and that the question whether the mind operates in dreams with all its intellectual faculties or with only a part of them is wrongly framed and disregards the facts. Since, however, there are plenty of dreams in whose content judgements are passed, criticisms made, and appreciations expressed, in which surprise is felt at some particular element of the dream, in which explanations are attempted and argumentations embarked upon, I must now proceed to meet the objections arising from facts of this kind by producing some chosen examples.

My reply [put briefly] is as follows: *Everything that appears in dreams as the ostensible activity of the function of judgement is to be regarded not as an intellectual achievement of the dream-work but as belonging to the material of the dream thoughts and as having been lifted from them into the manifest content of the dream as a ready-made structure.* I can even carry this assertion further. Even the judgements made *after waking* upon a dream that has been remembered, and the feelings called up in us by the reproduction of such a dream, form part, to a great

1 [*Hamlet*, II, 2.] This dream also provides a good example of the generally valid truth that dreams which occur during the same night, even though they are recollected as separate, spring from the groundwork of the same thoughts. [See above, p. 297.] Incidentally, the situation in the dream of my removing my children to safety from the city of Rome was distorted by being related back to an analogous event that occurred in my own childhood: I was envying some relatives who, many years earlier, had had an opportunity of removing their children to another country.

2 [The subject of absurdity in dreams is also discussed in Chapter VI of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 139 and 152. – In Section I of the case history of the 'Rat Man' (1909*d*), ibid., **10**, 166 *n.* 1, Freud remarks in a footnote that the same mechanism is used in obsessional neuroses.]

3 [Viz. condensation, displacement and considerations of representability.]

extent, of the latent content of the dream and are to be included in its interpretation.

I

I have already quoted a striking example of this [p. 295 above].[1] A woman patient refused to tell me a dream of hers because 'it was not clear
[446] enough'. She had seen someone in the dream but did not know whether it was her husband or her father. There then followed a second piece of dream in which a dustbin [*Misttrügerl*] appeared, and this gave rise to the following recollection. When she had first set up house she had jokingly remarked on one occasion in the presence of a young relative who was visiting in the house that her next job was to get hold of a new dustbin. The next morning one arrived for her, but it was filled with lilies of the valley. This piece of the dream served to represent a common [German] phrase 'not grown on my own manure'.[2] When the analysis was completed, it turned out that the dream thoughts were concerned with the after-effects of a story, which the dreamer had heard when she was young, of how a girl had had a baby and of how it was *not clear who the father really was*. Here, then, the dream representation had overflowed into the waking thoughts: one of the elements of the dream thoughts had found representation in a waking judgement passed upon the dream as a whole.

II

Here is a similar case. One of my patients had a dream which struck him as interesting, for immediately after waking he said to himself: '*I must tell the doctor that*.' The dream was analysed and produced the clearest allusions to a liaison which he had started during the treatment and which he had decided to himself *not to tell me about*.[3]

1 [Another example was also quoted in the same passage, p. 295 above.]

2 ['*Nicht auf meinem eigenen Mist gewachsen*' – meaning 'I am not responsible for that', or 'It's not my baby'. The German word '*Mist*', properly meaning manure, is used in slang for 'rubbish' and occurs in this sense in the Viennese term for a dustbin: '*Misttrügerl*'.]

3 [*Footnote added* 1909:] If in the actual course of a dream dreamt during psychoanalytic treatment the dreamer says to himself: '*I must tell the doctor that*', it invariably implies the presence of a strong resistance against confessing the dream – which is not infrequently thereupon forgotten.

III

Here is a third example, one from my own experience. *I was going to the hospital with P. through a district in which there were houses and gardens. At the same time I had a notion that I had often seen this district before in dreams. I did not know my way about very well. He showed me a road that led round the corner to a restaurant (indoors, not a garden). There I asked for Frau Doni and was told that she lived at the back in a small room with three children. I went towards it, but before I got* [447] *there met an indistinct figure with my two little girls; I took them with me after I had stood with them for a little while. Some sort of reproach against my wife, for having left them there.*

When I woke up I had a feeling of great *satisfaction*, the reason for which I explained to myself as being that I was going to discover from this analysis the meaning of 'I've dreamt of that before'.[1] In fact, however, the analysis taught me nothing of the kind; what it did show me was that the satisfaction belonged to the latent content of the dream and not to any judgement upon it. My satisfaction was with the fact that my marriage had brought me children. P. was a person whose course in life lay for some time alongside mine, who then outdistanced me both socially and materially, but whose marriage was childless. The two events which occasioned the dream will serve, instead of a complete analysis, to indicate its meaning. The day before, I had read in a newspaper the announcement of the death of Frau Dona A——y (which I turned into 'Doni' in the dream), who had died in childbirth. My wife told me that the dead woman had been looked after by the same midwife who had attended her at the birth of our two youngest children. The name 'Dona' had struck me because I had met it for the first time a short while before in an English novel. The second occasion for the dream was provided by the date on which it occurred. It was on the night before the birthday of my eldest boy – who seems to have some poetic gifts.

IV

I was left with the same feeling of satisfaction when I woke from the absurd dream of my father having played a political part among the Magyars after his death; and the reason I gave myself for this feeling

1 [See above, p. 357.] A protracted discussion on this subject has run through recent volumes of the *Revue Philosophique* [1896–8] under the title of 'Paramnesia in Dreams'. – [This dream is referred to again on p. 427 below.]

was that it was a continuation of the feeling that accompanied the last piece of the dream. [See p. 381 f. above.] *I remembered how like Garibaldi he had looked on his deathbed and felt glad that it had come true. . . . (There was a continuation which I had forgotten.)* The analysis enabled me to fill in this gap in the dream. It was a mention of my second son, to whom I had given the first name of a great historical
[448] figure [Cromwell] who had powerfully attracted me in my boyhood, especially since my visit to England. During the year before the child's birth I had made up my mind to use this name if it were a son and I greeted the newborn baby with it with a feeling of high *satisfaction*. (It is easy to see how the suppressed megalomania of fathers is transferred in their thoughts on to their children, and it seems quite probable that this is one of the ways in which the suppression of that feeling, which becomes necessary in actual life, is carried out.) The little boy's right to appear in the context of this dream was derived from the fact that he had just had the same misadventure – easily forgivable both in a child and in a dying man – of soiling his bedclothes. Compare in this connection *Stuhlrichter* ['presiding judge', literally 'chair' or 'stool judge'] and the wish expressed in the dream to stand before one's children's eyes *great* and *unsullied*. [See above, p. 382 f.]

v

I now turn to consider expressions of judgement passed in the dream itself but not continued into waking life or transposed into it. In looking for examples of these, my task will be greatly assisted if I may make use of dreams which I have already recorded with other aims in view. The dream of Goethe's attack on Herr M. [p. 392 ff.] appears to contain a whole number of acts of judgement. '*I tried to throw a little light on the chronological data, which seemed to me improbable*.' This has every appearance of being a criticism of the absurd idea that Goethe should have made a literary attack on a young man of my acquaintance. '*It seemed to be a plausible notion that he was eighteen*.' This, again, sounds exactly like the outcome of a calculation, though, it is true, of a feeble-minded one. Lastly, '*I was not quite sure what year we were in*' seems like an instance of uncertainty or doubt in a dream.

Thus all of these seemed to be acts of judgement made for the first time in the dream. But analysis showed that their wording can be taken in another way, in the light of which they become indispensable for the dream's interpretation, while at the same time every trace of absurdity

is removed. The sentence '*I tried to throw a little light on the chronological data*' put me in the place of my friend [Fliess] who was in fact seeking to throw light on the chronological data of life. This deprives the sentence of its significance as a judgement protesting against the absurdity of the preceding sentences. The interpolated phrase, '*which seemed to me improbable*', belonged with the subsequent one, '*It seemed* [449] *to be a plausible notion*'. I had used almost these precise words to the lady who had told her brother's case history. '*It seems to me an improbable notion* that his cries of "Nature! Nature!" had anything to do with Goethe; *it seems to me far more plausible* that the words had the sexual meaning you are familiar with.' It is true that here a judgement was passed – not in the dream, however, but in reality, and on an occasion which was recollected and exploited by the dream thoughts. The content of the dream took over this judgement just like any other fragment of the dream thoughts. The number '18' to which the judgement in the dream was senselessly attached retains a trace of the real context from which the judgement was torn. Lastly, '*I was not quite sure what year we were in*' was intended merely to carry further my identification with the paralytic patient in my examination of whom this point had really arisen.

The resolution of what are ostensibly acts of judgement in dreams may serve to remind us of the rules laid down at the beginning of this book [p. 92 above] for carrying out the work of interpretation: namely, that we should disregard the apparent coherence between a dream's constituents as an unessential illusion, and that we should trace back the origin of each of its elements on its own account. A dream is a conglomerate which, for purposes of investigation, must be broken up once more into fragments. [Cf. p. 374 f.] On the other hand, however, it will be observed that a psychical force is at work in dreams which creates this apparent connectedness, which, that is to say, submits the material produced by the dream-work to a 'secondary revision'. This brings us face to face with the manifestations of a force whose importance we shall later [p. 437 ff.] assess as the fourth of the factors concerned in the construction of dreams.

VI

Here is a further instance of a process of judgement at work in a dream that I have already recorded. In the absurd dream of the communication from the town council [p. 389 ff.] I asked: '*Did you get married soon after that?' I calculated that, of course, I was born in 1856, which seemed to be the year which immediately followed the year in question*. All of

this was clothed in the form of a set of logical conclusions. My father had married in 1851, immediately after his attack; I, of course, was the
[450] eldest of the family and had been born in 1856; Q.E.D. As we know, this false conclusion was drawn in the interests of wish fulfilment; and the predominant dream thought ran: '*Four or five years, that's no time at all; it doesn't count*.' Every step in this set of logical conclusions, however alike in their content and their form, could be explained in another way as having been determined by the dream thoughts. It was the *patient*, of whose long analysis my colleague had fallen foul, who had decided to get married immediately the treatment was finished. The manner of my interview with my father in the dream was like an interrogation or examination, and reminded me too of a teacher at the university who used to take down exhaustive particulars from the students who were enrolling themselves for his lectures: 'Date of birth?' – '1856.' – '*Patre*?' In reply to this, one gave one's father's first name with a Latin termination; and we students assumed that the Hofrat *drew conclusions* from the first name of the father which could not always be drawn from that of the student himself. Thus the *drawing of the conclusion* in the dream was no more than a repetition of the *drawing of a conclusion* which appeared as a piece of the material of the dream thoughts. Something new emerges from this. If a conclusion appears in the content of the dream there is no question that it is derived from the dream thoughts; but it may either be present in these as a piece of recollected material or it may link a series of dream thoughts together in a logical chain. In any case, however, a *conclusion* in a dream represents a conclusion in the dream thoughts.[1]

At this point we may resume our analysis of the dream. The interrogation by the professor led to a recollection of the register of university students (which in my time was drawn up in Latin). It led further to thoughts upon the course of my academic studies. The *five years* which are prescribed for medical studies were once again too few for me. I quietly went on with my work for several more years; and in my circle of acquaintances I was regarded as an idler and it was doubted whether I should ever get through. Thereupon I *quickly* decided to take my
[451] examinations and I got through them *in spite of the delay*. Here was a fresh reinforcement of the dream thoughts with which I was defiantly confronting my critics: 'Even though you won't believe it because I've

1 These findings are in some respects a correction of what I have said above (p. 277 f.) on the representation of logical relations in dreams. This earlier passage describes the general behaviour of the dream-work but takes no account of the finer and more precise details of its functioning.

taken my time, I *shall* get through; I *shall* bring my medical training to a *conclusion*. Things have often turned out like that before.'

This same dream in its opening passage contained some sentences which could hardly be refused the name of an argument. This argument was not even absurd; it might just as well have occurred in waking thought: *I was amused in the dream at the communication from the town council since, in the first place, I was not yet in the world in 1851 and, in the second place, my father, to whom it might have related, was already dead*. Both of these statements were not only correct in themselves but agreed precisely with the real arguments that I should bring up if I were actually to receive a communication of that kind. My earlier analysis of the dream showed that it grew out of deeply embittered and derisive dream thoughts (see p. 390 f.). If we may also assume that there were strong reasons present for the activity of the censorship, we shall understand that the dream-work had every motive for producing a *perfectly valid refutation of an absurd suggestion* on the model contained in the dream thoughts. The analysis showed, however, that the dream-work did not have a free hand in framing this parallel but was obliged, for that purpose, to use material from the dream thoughts. It was just as though there were an algebraic equation containing (in addition to numerals) plus and minus signs, indices and radical signs, and as though someone were to copy out the equation without understanding it, taking over both the operational symbols and the numerals into his copy but mixing them all up together. The two arguments [in the dream content] could be traced back to the following material. It was distressing to me to think that some of the premises which underlay my psychological explanations of the psychoneuroses were bound to excite scepticism and laughter when they were first met with. For instance, I had been driven to assume that impressions from the second year of life, and sometimes even from the first, left a lasting trace on the emotional life of those who were later to fall ill, and that these impressions – though distorted and exaggerated in many ways by the memory – might constitute the first and deepest foundation for hysterical symptoms. Patients, to whom I explained this at some appropriate moment, used to parody this newly gained knowledge by declaring that [452]
they were ready to look for recollections dating from a time *at which they were not yet alive*. My discovery of the unexpected part played by their *father* in the earliest sexual impulses of female patients might well be expected to meet with a similar reception (see the discussion on p. 228 f.). Nevertheless, it was my well-grounded conviction that both

of these hypotheses were true. By way of confirmation I called to mind some instances in which the death of the father occurred while the child was at a very early age and in which later events, otherwise inexplicable, proved that the child had nevertheless retained unconsciously recollections of the figure which had disappeared so early in his life. I was aware that these two assertions of mine rested on *the drawing of conclusions* whose validity would be disputed. It was therefore an achievement of wish fulfilment when the material of precisely *those conclusions which I was afraid would be contested* was employed by the dream-work for drawing *conclusions which it was impossible to contest*.

VII

At the beginning of a dream, which I have so far hardly touched upon [see p. 369 above], there was a clear expression of astonishment at the subject which had cropped up. *Old Brücke must have set me some task;* STRANGELY ENOUGH, *it related to a dissection of the lower part of my own body, my pelvis and legs, which I saw before me as though in the dissecting room, but without noticing their absence in myself and also without a trace of any gruesome feeling. Louise N. was standing beside me and doing the work with me. The pelvis had been eviscerated, and it was visible now in its superior, now in its inferior, aspect, the two being mixed together. Thick flesh-coloured protuberances (which, in the dream itself, made me think of haemorrhoids) could be seen. Something which lay over it and was like crumpled silver paper*[1] *had also to be carefully fished out. I was then once more in possession of my legs and was making my way through the town. But (being tired) I took a cab. To my astonishment the cab drove in through the door of a house, which opened and allowed it to pass along a passage which turned a corner at its end and* [453] *finally led into the open air again.*[2] *Finally I was making a journey through a changing landscape with an Alpine guide who was carrying my belongings. Part of the way he carried me too, out of consideration for my tired legs. The ground was boggy; we went round the edge; people were sitting on the ground like Red Indians or gypsies – among them a girl. Before this I had been making my own way forward over the slippery ground with a constant feeling of surprise that I was able to do it so well*

1 Stanniol, which was an allusion to the book by Stannius on the nervous system of fishes. (Cf. loc. cit.)

2 It was the place on the ground floor of my block of flats where the tenants keep their perambulators; but it was overdetermined in several other ways.

after the dissection. At last we reached a small wooden house at the end of which was an open window. There the guide set me down and laid two wooden boards, which were standing ready, upon the window-sill, so as to bridge the chasm which had to be crossed over from the window. At that point I really became frightened about my legs, but instead of the expected crossing, I saw two grown-up men lying on wooden benches that were along the walls of the hut, and what seemed to be two children sleeping beside them. It was as though what was going to make the crossing possible was not the boards but the children. I awoke in a mental fright.

Anyone who has formed even the slightest idea of the extent of condensation in dreams will easily imagine what a number of pages would be filled by a full analysis of this dream. Fortunately, however, in the present context I need only take up one point in it, which provides an example of astonishment in dreams, as exhibited in the interpolation '*strangely enough*'. The following was the occasion of the dream. Louise N., the lady who was assisting me in my job in the dream, had been calling on me. 'Lend me something to read,' she had said. I offered her Rider Haggard's *She*. 'A *strange* book, but full of hidden meaning,' I began to explain to her; 'the eternal feminine, the immortality of our emotions . . .' Here she interrupted me: 'I know it already. Have you nothing of your own?' – 'No, my own immortal works have not yet been written.' – 'Well, when are we to expect these so-called ultimate explanations of yours which you've promised even *we* shall find readable?' she asked, with a touch of sarcasm. At that point I saw that someone else was admonishing me through her mouth and I was silent. I reflected on the amount of self-discipline it was costing me to offer the public even my book upon dreams – I should have to give away so much of my own private character in it.

> Das Beste, was du wissen kannst,
> Darfst du den Buben doch nicht sagen.[1]

The task which was imposed on me in the dream of carrying out a dissection *of my own body* was thus my *self-analysis*[2] which was linked up with my giving an account of my dreams. Old Brücke came in here appropriately; even in the first years of my scientific work it happened that I allowed a discovery of mine to lie fallow until an energetic [454]

1 [See footnote 1, p. 126 above.]

2 [Freud's self-analysis during the years before the publication of this book is one of the themes of his correspondence with Fliess (Freud, 1950*a*). Cf. Part III of Kris's introduction to the latter volume.]

remonstrance on his part drove me into publishing it. The further thoughts which were started up by my conversation with Louise N. went too deep to become conscious. They were diverted in the direction of the material that had been stirred up in me by the mention of Rider Haggard's *She*. The judgement '*strangely enough*' went back to that book and to another one, *Heart of the World*, by the same author; and numerous elements of the dream were derived from these two imaginative novels. The boggy ground over which people had to be carried, and the chasm which they had to cross by means of boards brought along with them, were taken from *She*; the Red Indians, the girl and the wooden house were taken from *Heart of the World*. In both novels the guide is a woman; both are concerned with perilous journeys; while *She* describes an adventurous road that had scarcely ever been trodden before, leading into an undiscovered region. The tired feeling in my legs, according to a note which I find I made upon the dream, had been a real sensation during the daytime. It probably went along with a tired mood and a doubting thought: 'How much longer will my legs carry me?' The end of the adventure in *She* is that the guide, instead of finding immortality for herself and the others, perishes in the mysterious subterranean fire. A fear of that kind was unmistakably active in the dream thoughts. The 'wooden house' was also, no doubt, a coffin, that is to say, the grave. But the dream-work achieved a masterpiece in its representation of this most unwished for of all thoughts by a wish fulfilment. For I had already been in a grave once, but it was an excavated Etruscan grave near Orvieto, a narrow chamber with two stone benches along its walls, on which the skeletons of two grown-up men were lying. The inside of the wooden house in the dream looked exactly like it, except that the stone was replaced by wood. The dream seems to have been
[455] saying: 'If you must rest in a grave, let it be the Etruscan one.' And, by making this replacement, it transformed the gloomiest of expectations into one that was highly desirable.[1] Unluckily, as we are soon to hear [p. 411 ff. below], a dream can turn into its opposite the *idea* accompanying an affect but not always the affect itself. Accordingly, I woke up in a '*mental fright*', even after the successful emergence of the idea that children may perhaps achieve what their father has failed to – a fresh allusion to the strange novel in which a person's identity is retained through a series of generations for over two thousand years.[2]

1 [This detail is used as an illustration in Chapter III of Freud's *Future of an Illusion* (1927*c*), *RSE*, **21**, 16.]

2 [This dream is further discussed below on p. 427.]

VIII

Included in yet another of my dreams there was an expression of surprise at something I had experienced in it; but the surprise was accompanied by such a striking, far-fetched and almost brilliant attempt at an explanation that, if only on *its* account, I cannot resist submitting the whole dream to analysis, quite apart from the dream's possessing two other points to attract our interest. I was travelling along the *Südbahn* railway line during the night of July 18–19, and in my sleep I heard: *'Hollthurn,*[1] *ten minutes' being called out. I at once thought of holothurians* [sea slugs] *– of a natural history museum – that this was the spot at which valiant men had fought in vain against the superior power of the ruler of their country – yes, the Counter-Reformation in Austria – it was as though it were a place in Styria or the Tyrol. I then saw indistinctly a small museum, in which the relics or belongings of these men were preserved. I should have liked to get out, but hesitated to do so. There were women with fruit on the platform. They were crouching on the ground and holding up their baskets invitingly. – I hesitated because I was not sure whether there was time, but we were still not moving. – I was suddenly in another compartment, in which the upholstery and seats were so narrow that one's back pressed directly against the back of the carriage.*[2] *I was surprised by this, but I reflected that* I MIGHT HAVE CHANGED CARRIAGES WHILE I WAS IN A SLEEPING STATE. *There were several people, including an English brother and sister; a row* [456] *of books were distinctly visible on a shelf on the wall. I saw 'The Wealth of Nations' and 'Matter and Motion' (by Clerk Maxwell), a thick volume and bound in brown cloth. The man asked his sister about a book by Schiller, whether she had forgotten it. It seemed as though the books were sometimes mine and sometimes theirs. I felt inclined at that point to intervene in the conversation in a confirmatory or substantiating sense*. . . . I woke up perspiring all over, because all the windows were shut. The train was drawn up at Marburg [in Styria].

While I was writing the dream down a new piece of it occurred to me, which my memory had tried to pass over. *I said* [in English] *to the brother and sister, referring to a particular work: 'It is from . . .', but*

1 [Not the name of any real place.]

2 This description was unintelligible even to myself; but I have followed the fundamental rule of reporting a dream in the words which occurred to me as I was writing it down. The wording chosen is itself part of what is represented by the dream. [Cf. p. 459 below.]

corrected myself: 'It is by . . .' 'Yes,' the man commented to his sister, 'he said that right.'[1]

The dream opened with the name of the station, which must no doubt have partly woken me up. I replaced its name, *Marburg*, with *Hollthurn*. The fact that I heard 'Marburg' when it was first called out, or perhaps later, was proved by the mentioning in the dream of Schiller, who was born at Marburg, though not at the one in Styria.[2] I was making my journey on that occasion, although I was travelling first class, under very uncomfortable conditions. The train was packed full, and in my compartment I had found a lady and gentleman who appeared to be very aristocratic and had not the civility, or did not think it worth the trouble, to make any disguise of their annoyance at my intrusion. My polite greeting met with no response. Although the man and his wife were sitting side by side (with their backs to the engine), the woman nevertheless made haste, under my very eyes, to engage the window-seat facing her by putting an umbrella on it. The door was shut immediately, and pointed remarks were exchanged between them on the subject of opening windows. They had probably seen at once that I was longing for some fresh air. It was a hot night and the atmosphere
[457] in the completely closed compartment soon became suffocating. My experiences of travelling have taught me that conduct of this ruthless and overbearing kind is a characteristic of people who are travelling on a free or half-price ticket. When the ticket collector came and I showed him the ticket I had bought at such expense, there fell from the lady's mouth, in haughty and almost menacing tones, the words: 'My husband has a free pass.' She was an imposing figure with discontented features, of an age not far from the time of the decay of feminine beauty; the man uttered not a word but sat there motionless. I attempted to sleep. In my dream I took fearful vengeance on my disagreeable companions; no-one could suspect what insults and humiliations lay concealed behind the broken fragments of the first half of the dream. When this need had been satisfied a second wish made itself felt – to change compartments. The scene is changed so often in dreams, and without the slightest objection being raised, that it would not have been in the least surprising if I had promptly replaced my travelling

1 [This piece of the dream is further considered on p. 464 f. below.]

2 [*Footnote added* 1909:] Schiller was not born at any Marburg, but at Marbach, as every German schoolboy knows, and as I knew myself. This was one more of those mistakes (see above, p. 174 *n.* 1) which slip in as a substitute for an intentional falsification at some other point, and which I have tried to explain in my *Psychopathology of Everyday Life* [1901*b*, Chapter X, No. 1; *RSE*, **6**, 187 ff.].

companions with more agreeable ones derived from my memory. But here was a case in which something resented the change of scene and thought it necessary to explain it. How did I suddenly come to be in another compartment? I had no recollection of having changed. There could be only one explanation: *I must have left the carriage while I was in a sleeping state* – a rare event, of which, however, examples are to be found in the experience of a neuropathologist. We know of people who have gone upon railway journeys in a twilight state, without betraying their abnormal condition by any signs, till at some point in the journey they have suddenly come to themselves completely and been amazed at the gap in their memory. In the dream itself, accordingly, I was declaring myself to be one of these cases of '*automatisme ambulatoire*'.

Analysis made it possible to find another solution. The attempt at an explanation, which seemed so striking when I was obliged to ascribe it to the dream-work, was not an original one of my own, but was copied from the neurosis of one of my patients. I have already spoken elsewhere [p. 231 above] of a highly educated and, in real life, soft-hearted man who, shortly after the death of his parents, began to reproach himself with having murderous inclinations, and then fell victim to the precautionary measures which he was obliged to adopt as a safeguard. It was a case of severe obsessions accompanied by complete insight. To begin with, walking through the streets was made [458]
a burden to him by a compulsion to make certain where every single person he met disappeared to; if anyone suddenly escaped his watchful eye, he was left with a distressing feeling and the idea that he might possibly have got rid of him. What lay behind this was, among other things, a 'Cain' phantasy – for 'all men are brothers'. Owing to the impossibility of carrying out this task, he gave up going for walks and spent his life incarcerated between his own four walls. But reports of murders which had been committed outside were constantly being brought into his room by the newspapers, and his conscience suggested to him, in the form of a doubt, that he might be the wanted murderer. The certainty that he had in fact not left his house for weeks protected him from these charges for a while, till one day the possibility came into his head that *he might have left his house while he was in an unconscious state* and have thus been able to commit the murder without knowing anything about it. From that time onwards he locked the front door of the house and gave the key to his old

housekeeper with strict instructions never to let it fall into his hands even if he asked for it.

This, then, was the origin of my attempted explanation to the effect that I had changed carriages while I was in an unconscious state; it had been carried over ready-made into the dream from the material of the dream thoughts, and was evidently intended in the dream to serve the purpose of identifying me with the figure of this patient. My recollection of him had been aroused by an easy association. My last night journey, a few weeks earlier, had been made in the company of this very man. He was cured, and was travelling with me into the provinces to visit his relatives, who had sent for me. We had a compartment to ourselves; we left all the windows open all through the night and had a most entertaining time for as long as I stayed awake. I knew that the root of his illness had been hostile impulses against his father, dating from his childhood and involving a sexual situation. Insofar, therefore, as I was identifying myself with him, I was seeking to confess to something analogous. And in fact the second scene of the dream ended in a somewhat extravagant phantasy that my two elderly travelling companions had treated me in such a stand-offish way because my arrival had prevented the affectionate exchanges
[459] which they had planned for the night. This phantasy went back, however, to a scene of early childhood in which the child, probably driven by sexual curiosity, had forced his way into his parents' bedroom and been turned out of it by his father's orders.

It is unnecessary, I think, to accumulate further examples. They would merely serve to confirm what we have gathered from those I have already quoted – that an act of judgement in a dream is only a repetition of some prototype in the dream thoughts. As a rule, the repetition is ill applied and interpolated into an inappropriate context, but occasionally, as in our last instances, it is so neatly employed that to begin with it may give the impression of independent intellectual activity in the dream. From this point we might turn our attention to the psychical activity which, though it does not appear to accompany the construction of dreams invariably, yet, whenever it does so, is concerned to fuse together elements in a dream which are of disparate origin into a whole which shall make sense and be without contradiction. Before approaching that subject, however, we are under an urgent necessity to consider the expressions of affect which occur in dreams and to compare them with the affects which analysis uncovers in the dream thoughts.

(H)
AFFECTS IN DREAMS

A shrewd observation made by Stricker [1879, 51] has drawn our attention [460]
to the fact that the expression of affect in dreams cannot be dealt with in the same contemptuous fashion in which, after waking, we are accustomed to dismiss their *content*. 'If I am afraid of robbers in a dream, the robbers, it is true, are imaginary – but the fear is real.' [Cf. p. 65 above.] And this is equally true if I feel *glad* in a dream. Our feeling tells us that an affect experienced in a dream is in no way inferior to one of equal intensity experienced in waking life; and dreams insist with greater energy upon their right to be included among our real mental experiences in respect to their affective than in respect to their ideational content [*Vorstellungsinhalt*]. In our waking state, however, we cannot in fact include them in this way, because we cannot make any psychical assessment of an affect unless it is linked to a piece of ideational material. If the affect and the idea are incompatible in their character and intensity, our waking judgement is at a loss.

It has always been a matter for surprise that in dreams the ideational content is not accompanied by the affective consequences that we should regard as inevitable in waking thought. Strümpell [1877, 27 f.] declared that in dreams ideas are denuded of their psychical values [cf. p. 48]. But there is no lack in dreams of instances of a contrary kind, where an intense expression of affect appears in connection with subject matter which seems to provide no occasion for any such expression. In a dream I may be in a horrible, dangerous and disgusting situation without feeling any fear or repulsion; while another time, on the contrary, I may be terrified at something harmless and delighted at something childish.

This particular enigma of dream life vanishes more suddenly, perhaps, and more completely than any other, as soon as we pass over from the manifest to the latent content of the dream. We need not bother about the enigma, since it no longer exists. Analysis shows us that *the ideational material has undergone displacements and substitutions, whereas the affects have remained unaltered*. It is small wonder that the ideational [461]
material, which has been changed by dream distortion, should no longer be compatible with the affect, which is retained unmodified; nor is there

anything left to be surprised at after analysis has put the right material back into its former position.[1]

In the case of a psychical complex which has come under the influence of the censorship imposed by resistance, the *affects* are the constituent which is least influenced and which alone can give us a pointer as to how we should fill in the missing thoughts. This is seen even more clearly in the psychoneuroses than in dreams. Their affects are always appropriate, at least in their *quality*, though we must allow for their intensity being increased owing to displacements of neurotic attention. If a hysteric is surprised at having to be so frightened of something trivial or if a man suffering from obsessions is surprised at such distressing self-reproaches arising out of a mere nothing, they have both gone astray, because they regard the ideational content – the triviality or the mere nothing – as what is essential; and they put up an unsuccessful fight because they take this ideational content as the starting point of their thought activity. Psychoanalysis can put them upon the right path by recognizing the affect as being, on the contrary, justified and by seeking out the idea which belongs to it but has been repressed and replaced by a substitute. A necessary premise to all this is that the release of affect and the ideational content do not constitute the indissoluble organic unity as
[462] which we are in the habit of treating them, but that these two separate entities may be merely *soldered* together and can thus be detached from each other by analysis.[2] Dream interpretation shows that this is in fact the case.

1 [*Footnote added* 1919:] If I am not greatly mistaken, the first dream that I was able to pick up from my grandson, at the age of one year and eight months, revealed a state of affairs in which the dream-work had succeeded in transforming the *material* of the dream thoughts into a wish fulfilment, whereas the *affect* belonging to them persisted unchanged during the state of sleep. On the night before the day on which his father was due to leave for the front, the child cried out, sobbing violently: 'Daddy! Daddy! – baby!' This can only have meant that Daddy and baby were remaining together; whereas the tears recognized the approaching farewell. At that time the child was already quite well able to express the concept of separation. '*Fort*' ['gone'] (replaced by a long-drawn-out and peculiarly stressed 'o – o – o') had been one of his first words, and several months before this first dream he had played at 'gone' with all his toys. This game went back to a successful piece of self-discipline which he had achieved at an early age in allowing his mother to leave him and be 'gone'. [Cf. Chapter II of *Beyond the Pleasure Principle* (Freud, 1920*g*), *RSE*, **18**, 14 ff.]

2 [This harks back to Freud's fundamental hypothesis to the effect that mental activity involves two basic components: a 'quota of affect' and 'memory traces of ideas' (1894*a*; see Editors' Appendix, ibid., **3**, 57 ff.). The different vicissitudes of affective and ideational material in dreams described here anticipate his assertion that affects, unlike ideas, are not subject to repression. See, for example, Freud (1915*e*), ibid., **14**, 157: 'It is surely of the essence of an emotion that we should be aware of it, i.e. that it should become known to consciousness. Thus the possibility of the attribute of unconsciousness would be completely excluded as far as emotions, feelings and affects are concerned.']

I shall begin by giving an example in which analysis explained the apparent absence of affect in a case where the ideational content should have necessitated its release.

I

She saw three lions in a desert, one of which was laughing; but she was not afraid of them. Afterwards, however, she must have run away from them, for she was trying to climb up a tree; but she found that her cousin, who was a French mistress, was up there already, etc.

The analysis brought up the following material. The indifferent precipitating cause of the dream was a sentence in her English composition: 'The mane is the ornament of the lion.' Her father wore a beard which framed his face like a mane. Her English mistress was called Miss Lyons. An acquaintance had sent her the ballads of Loewe [the German word for 'lion']. These, then, were the three lions; why should she be afraid of them? – She had read a story in which a negro, who had stirred up his companions to revolt, was hunted with bloodhounds and climbed up a tree to save himself. She went on, in the highest spirits, to produce a number of fragmentary recollections, such as the advice on how to catch lions from *Fliegende Blätter*: 'Take a desert and put it through a sieve and the lions will be left over.' And again, the highly amusing but not very proper anecdote of an official who was asked why he did not take more trouble to ingratiate himself with the head of his department and replied that he had tried to make his way in, but his superior *was up there already*. The whole material became intelligible when it turned out that the lady had had a visit on the dream day from her husband's superior. He had been very polite to her and had kissed her hand and *she had not been in the least afraid of him*, although he was a very 'big bug' [in German, '*grosses Tier*' = 'big animal'], and played the part of a 'social *lion*' in the capital of the country she came from. So this lion was like the lion in *A Midsummer Night's Dream* that concealed the figure of Snug the joiner; and the same is true of all dream lions of which the dreamer is not afraid.

II

As my second example I may quote the dream of the young girl who saw her sister's little son lying dead in his coffin [pp. 135 f. and 220 f. above], but who, as I may now add, felt neither pain nor grief. We know from the [463]

analysis why this was. The dream merely disguised her wish to see the man she was in love with once more; and her affect had to be in tune with her wish and not with its disguise. There was thus no occasion for grief.

In some dreams the affect does at least remain in contact with the ideational material which has replaced that to which the affect was originally attached. In others, the dissolution of the complex has gone further. The affect makes its appearance completely detached from the idea which belongs to it and is introduced at some other point in the dream, where it fits in with the new arrangement of the dream elements. The situation is then similar to the one we have found in the case of acts of judgement in dreams [p. 397 ff. above]. If an important conclusion is drawn in the dream thoughts, the dream also contains one; but the conclusion in the dream may be displaced on to quite different material. Such a displacement not infrequently follows the principle of antithesis.

This last possibility is exemplified in the following dream, which I have submitted to a most exhaustive analysis.

III

A castle by the sea; later it was no longer immediately on the sea, but on a narrow canal leading to the sea. The governor was a Herr P. I was standing with him in a big reception room – with three windows in front of which there rose buttresses with what looked like crenellations. I had been attached to the garrison as something in the nature of a volunteer naval officer. We feared the arrival of enemy warships, since we were in a state of war. Herr P. intended to leave, and gave me instructions as to what was to be done if the event that we feared took place. His invalid wife was with their children in the threatened castle. If the bombardment began, the great hall was to be evacuated. He breathed heavily and turned to go; I held him back and asked him how I was to communicate with him in case of necessity. He added something in reply, but immediately fell down dead. No doubt I had put an unnecessary strain upon him with my questions. After his death, which [464] *made no further impression on me, I wondered whether his widow would remain in the castle, whether I should report his death to the Higher Command and whether I should take over command of the castle as being next in order of rank. I was standing at the window, and observing the ships as they went past. They were merchant vessels rushing past rapidly through the dark water, some of them with several*

funnels and others with bulging decks (just like the station buildings in the introductory dream – not reported here). *Then my brother was standing beside me and we were both looking out of the window at the canal. At the sight of one ship we were frightened and cried out: 'Here comes the warship!' But it turned out that it was only the same ships that I already knew returning. There now came a small ship, cut off short, in a comic fashion, in the middle. On its deck some curious cup-shaped or box-shaped objects were visible. We called out with one voice: 'That's the breakfast-ship.'*

The rapid movements of the ships, the deep dark blue of the water and the brown smoke from the funnels – all of this combined to create a tense and sinister impression.

The localities in the dream were brought together from several trips of mine to the Adriatic (to Miramare, Duino, Venice and Aquileia). A short but enjoyable Easter trip which I had made to Aquileia with my brother a few weeks before the dream was still fresh in my memory.[1] The dream also contained allusions to the *maritime war* between America and Spain and to anxieties to which it had given rise about the fate of my relatives in America. At two points in the dream affects were in question. At one point an affect that was to be anticipated was absent: attention was expressly drawn to the fact that the governor's death made no impression on me. At another point, when I thought I saw the warship, I was *frightened* and felt all the sensations of fright in my sleep. In this well-constructed dream the affects were distributed in such a way that any striking contradiction was avoided. There was no reason why I should be frightened at the death of the governor and it was quite reasonable that as commandant of the castle I should be frightened at the sight of the warship. The analysis showed, however, that Herr P. was only a substi- [465]
tute for my own self. (In the dream *I* was the substitute for *him*.) *I* was the governor who suddenly died. The dream thoughts dealt with the future of my family after my premature death. This was the only distressing one among the dream thoughts; and it must have been from it that the fright was detached and brought into connection in the dream with the sight of the warship. On the other hand, the analysis showed that the region of the dream thoughts from which the warship was taken was filled with the most cheerful recollections. It was a year earlier, in Venice, and we were standing one magically beautiful day at the windows of our room on the

1 [This trip was described at length by Freud in a letter to Fliess of April 14, 1898 (Freud, 1950*a*, Letter 88). Aquileia, a few miles inland, is connected by a small canal with the lagoon, on one of whose islands Grado is situated. These places, at the northern end of the Adriatic, formed part of Austria before 1918.]

Riva degli Schiavoni and were looking across the blue lagoon on which that day there was more movement than usual. English ships were expected and were to be given a ceremonial reception. Suddenly my wife cried out gaily as a child: '*Here comes the English warship!*' In the dream I was frightened at these same words. (We see once again that speeches in a dream are derived from speeches in real life [cf. p. 373 ff. above]; I shall show shortly that the element 'English' in my wife's exclamation did not elude the dream-work either.) Here, then, in the process of changing the dream thoughts into the manifest dream content, I have transformed cheerfulness into fear, and I need only hint that this transformation was itself giving expression to a portion of the latent dream content. This example proves, however, that the dream-work is at liberty to detach an affect from its connections in the dream thoughts and introduce it at any other point it chooses in the manifest dream.

I take this opportunity of making a somewhat detailed analysis of the 'breakfast-ship', the appearance of which in the dream brought such a nonsensical conclusion to a situation which had up to then been kept at a rational level. When I called the dream object more precisely to mind, it struck me retrospectively [*nachträglich*] that it was black and that, owing to the fact that it was cut off short where it was broadest in the middle, it bore a great resemblance at that end to a class of objects which had attracted our interest in the museums in the Etruscan towns. These were rectangular trays of black pottery, with two handles, on which there stood things like coffee- or tea-cups, not altogether unlike one of our modern *breakfast sets*. In response to our enquiries we learnt that this
[466] was the '*toilette*' [toilet-set] of an Etruscan lady, with receptacles for cosmetics and powder on it, and we had jokingly remarked that it would be a good idea to take one home with us for the lady of the house. The object in the dream meant, accordingly, a black 'toilette', i.e. mourning dress, and made a direct reference to a death. The other end of the dream object reminded me of the funeral boats[1] in which in early times dead bodies were placed and committed to the sea for burial. This led on to the point which explained why the ships *returned* in the dream:

> Still, auf gerettetem Boot, treibt in den Hafen der Greis.[2]

1 '*Nachen*' [in German], a word which is derived, as a philological friend tells me, from the root '*νέκυς*' [corpse].

2 ['Safe on his ship, the old man quietly sails into port.' (Part of an allegory of life and death.) Schiller, *Nachträge zu den Xenien*, 'Erwartung und Erfüllung'.]

It was the return after a shipwreck ['*Schiffbruch*', literally 'ship-break'] – the breakfast-ship was broken off short in the middle. But what was the origin of the name 'breakfast'-ship? It was here that the word 'English' came in, which was left over from the warships. The English word 'breakfast' means 'breaking fast'. The 'breaking' related once more to the shipwreck ['ship-break'] and the fasting was connected with the black dress or *toilette*.

But it was only the *name* of the breakfast-ship that was newly constructed by the dream. The *thing* had existed and reminded me of one of the most enjoyable parts of my last trip. Mistrusting the food that would be provided at Aquileia, we had brought provisions with us from Gorizia and had bought a bottle of excellent Istrian wine at Aquileia. And while the little mail steamer made its way slowly through the '*Canale delle Mee*' across the empty lagoon to Grado we, who were the only passengers, ate our breakfast on deck in the highest spirits, and we had rarely tasted a better one. This, then, was the 'breakfast-ship', and it was precisely behind this memory of the most cheerful *joie de vivre* that the dream concealed the gloomiest thoughts of an unknown and uncanny future.[1]

The detachment of affects from the ideational material which generated them is the most striking thing which occurs to them during the formation of dreams; but it is neither the only nor the most essential alteration undergone by them on their path from the dream thoughts to the manifest dream. If we compare the affects of the dream thoughts with those in the dream, one thing at once becomes clear. Whenever there is an affect in the dream, it is also to be found in the dream thoughts. But the reverse is not true. A dream is in general poorer in affect than the psychical material from the manipulation of which it has proceeded. When I have reconstructed the dream thoughts, I habitually find the most intense psychical impulses in them striving to make themselves felt and struggling as a rule against others that are sharply opposed to them. If I then turn back to the dream, it not infrequently appears colourless, and without emotional tone of any great intensity. The dream-work has reduced to a level of indifference not only the content but often the emotional tone of my thoughts as well. It might be said that the dream-work brings about a *suppression of affects*. Let us, for instance, take the dream of the botanical monograph [p. 149 ff. above]. The thoughts corresponding to it consisted of a passionately agitated plea on behalf of my liberty to act [467]

1 [This dream is mentioned again on p. 489 below.]

as I chose to act and to govern my life as seemed right to me and me alone. The dream that arose from them has an indifferent ring about it: 'I had written a monograph; it lay before me; it contained coloured plates; dried plants accompanied each copy.' This reminds one of the peace that has descended upon a battlefield strewn with corpses; no trace is left of the struggle which raged over it.

Things can be otherwise: lively manifestations of affect can make their way into the dream itself. For the moment, however, I will dwell upon the incontestable fact that large numbers of dreams appear to be indifferent, whereas it is never possible to enter into the dream thoughts without being deeply moved.

No complete theoretical explanation can here be given of this suppression of affect in the course of the dream-work. It would need to be preceded by a most painstaking investigation of the theory of affects and of the mechanism of repression. [Cf. p. 540 ff. below.] I will only permit myself a reference to two points. I am compelled – for other reasons – to picture the release of affects as a centrifugal process directed towards the
[468] interior of the body and analogous to the processes of motor and secretory innervation.[1] Now just as in the state of sleep the sending out of motor impulses towards the external world appears to be suspended, so it may be that the centrifugal calling up of affects by unconscious thinking may become more difficult during sleep. In that case the affective impulses occurring during the course of the dream thoughts would from their very nature be weak impulses, and consequently those which found their way into the dream would be no less weak. On this view, then, the 'suppression of affect' would not in any way be the consequence of the dream-work but would result from the state of sleep. This may be true, but it cannot be the whole truth. We must also bear in mind that any relatively complex dream turns out to be a compromise produced by a conflict between psychical forces. For one thing, the thoughts constructing the wish are obliged to struggle against the opposition of a censoring agency; and for another thing, we have often seen that in unconscious thinking itself every train of thought is yoked with its contradictory opposite. Since all of these trains of thought are capable of carrying an affect, we shall by and large scarcely be wrong if we regard the suppression of affect as a consequence of the inhibition [*Hemmung*][T] which

1 [The release of affects is described as 'centrifugal' (though directed towards the interior of the body) from the point of view of the mental apparatus. The theory of the release of affects implicit in this passage is explained at some length in Section 12 ('The Experience of Pain') of Part I of Freud's 'Project for a Scientific Psychology' (in Freud, 1950*a*). See also p. 520 f. below. – For Freud's use of the term 'innervation', see footnote 1, p. 480 below.]

these contraries exercise upon each other and which the censorship exercises upon the impulsions suppressed by it. *The inhibition of affect, accordingly, must be considered as the second consequence of the censorship of dreams, just as dream distortion is its first consequence.*

I will here give as an instance a dream in which the indifferent feeling-tone of the content of the dream can be explained by the antithesis between the dream thoughts. It is a short dream, which will fill every reader with disgust.

IV

A hill, on which there was something like an open-air closet: a very long seat with a large hole at the end of it. Its back edge was thickly covered [469] *with small heaps of faeces of all sizes and degrees of freshness. There were bushes behind the seat. I micturated on the seat; a long stream of urine washed everything clean; the lumps of faeces came away easily and fell into the opening. It was as though at the end there was still some left.*

Why did I feel no disgust during this dream?

Because, as the analysis showed, the most agreeable and satisfying thoughts contributed to bringing the dream about. What at once occurred to me in the analysis were the Augean stables which were cleansed by Hercules. This Hercules was I. The hill and bushes came from Aussee, where my children were stopping at the time. I had discovered the infantile aetiology of the neuroses and had thus saved my own children from falling ill. The seat (except, of course, for the hole) was an exact copy of a piece of furniture which had been given to me as a present by a grateful woman patient. It thus reminded me of how much my patients honoured me. Indeed, even the museum of human excrement could be given an interpretation to rejoice my heart. However much I might be disgusted by it in reality, in the dream it was a reminiscence of the fair land of Italy where, as we all know, the WCs in the small towns are furnished in precisely this way. The stream of urine which washed everything clean was an unmistakable sign of greatness. It was in that way that Gulliver extinguished the great fire in Lilliput – though incidentally this brought him into disfavour with its tiny queen. But Gargantua, too, Rabelais' superman, revenged himself in the same way on the Parisians by sitting astride Notre Dame and turning his stream of urine upon the city. It was only on the previous evening before going to sleep that I had been turning over Garnier's illustrations to Rabelais. And, strangely enough, here was another piece of evidence that I was the superman. The platform of

Notre Dame was my favourite resort in Paris; every free afternoon I used to clamber about there on the towers of the church between the monsters and the devils. The fact that all the faeces disappeared so quickly under the stream recalled the motto: '*Afflavit et dissipati sunt*', which I intended one day to put at the head of a chapter upon the therapy of hysteria.[1]

[470] And now for the true exciting cause of the dream. It had been a hot summer afternoon; and during the evening I had delivered my lecture on the connection between hysteria and the perversions, and everything I had had to say displeased me intensely and seemed to me completely devoid of any value. I was tired and felt no trace of enjoyment in my difficult work; I longed to be away from all this grubbing about in human dirt and to be able to join my children and afterwards visit the beauties of Italy. In this mood I went from the lecture room to a café, where I had a modest snack in the open air, since I had no appetite for food. One of my audience, however, went with me and he begged leave to sit by me while I drank my coffee and choked over my crescent roll. He began to flatter me: telling me how much he had learnt from me, how he looked at everything now with fresh eyes, how I had cleansed the *Augean stables* of errors and prejudices in my theory of the neuroses. He told me, in short, that I was a very great man. My mood fitted ill with this paean of praise; I fought against my feeling of disgust, went home early to escape from him, and before going to sleep turned over the pages of Rabelais and read one of Conrad Ferdinand Meyer's short stories, 'Die Leiden eines Knaben' [A Boy's Sorrows].

Such was the material out of which the dream emerged. Meyer's short story brought up in addition a recollection of scenes from my childhood. (Cf. the last episode in the dream about Count Thun [p. 191 above].) The daytime mood of revulsion and disgust persisted into the dream insofar as it was able to provide almost the entire material of its manifest content. But during the night a contrary mood of powerful and even exaggerated self-assertiveness arose and displaced the former one. The content of the dream had to find a form which would enable it to express both the delusions of inferiority and the megalomania in the same material. The compromise between them produced an ambiguous dream content; but it also resulted in an indifferent feeling-tone owing to the mutual inhibition of these contrary impulses.

According to the theory of wish fulfilment, this dream would not have become possible if the antithetical megalomanic train of thought (which, it is true, was suppressed, but had a pleasurable tone) had not emerged in

1 [*Footnote in* 1925 *edition only*:] For a correction of this quotation see above, p. 189 *n*. 3.

Freud writes (on p. 419 above) of a dream in which he himself identified with the superman Gargantua, who 'revenged himself [. . .] on the Parisians by sitting astride Notre Dame and turning his stream of urine upon the city'.

Bibliothèque nationale de France.

addition to the feeling of disgust. For what is distressing may not be represented in a dream; nothing in our dream thoughts which is distressing can force an entry into a dream unless it at the same time lends a [471]
disguise to the fulfilment of a wish. [Cf. p. 497 f. below.]

There is yet another alternative way in which the dream-work can deal with affects in the dream thoughts, in addition to allowing them through or reducing them to nothing. It can *turn them into their opposite*. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. [See p. 283 f. above.] We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: 'dream books' very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like any other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish fulfilment, for wish fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the *affects* attaching to dream thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream censorship. In social life, which has provided us with our familiar analogy with the dream censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my *affect* from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the *opposite* affect – smile when I am angry and seem affectionate when I wish to destroy.

We have already come across an excellent example of a reversal of [472]
affect of this kind carried out in a dream on behalf of the dream

censorship. In the dream of 'my uncle with the yellow beard' [p. 122 ff.] I felt the greatest affection for my friend R., whereas and because the dream thoughts called him a simpleton. It was from this example of reversal of affect that we derived our first hint of the existence of a dream censorship. Nor is it necessary to assume, in such cases either, that the dream-work *creates* contrary affects of this kind out of nothing; it finds them as a rule lying ready to hand in the material of the dream thoughts, and merely intensifies them with the psychical force arising from a motive of defence, till they can predominate for the purposes of dream formation. In the dream of my uncle which I have just mentioned, the antithetical, affectionate affect probably arose from an infantile source (as was suggested by the later part of the dream), for the uncle–nephew relationship, owing to the peculiar nature of the earliest experiences of my childhood (cf. the analysis on p. 379 [and below, p. 431 f.]), had become the source of all my friendships and all my hatreds.

An excellent example of a reversal of affect of this kind[1] can be found in a dream recorded by Ferenczi (1916): 'An elderly gentleman was awakened one night by his wife, who had become alarmed because he was laughing so loudly and unrestrainedly in his sleep. Subsequently the man reported that he had had the following dream: *I was lying in bed and a gentleman who was known to me entered the room; I tried to turn on the light but was unable to: I tried over and over again, but in vain. Thereupon my wife got out of bed to help me, but she could not manage it either. But as she felt awkward in front of the gentleman owing to being "en négligé", she finally gave it up and went back to bed. All of this was so funny that I couldn't help roaring with laughter at it. My wife said "Why are you laughing? Why are you laughing?" but I only went on laughing till I woke up*. – Next day the gentleman was very depressed and had a headache: so much laughing had upset him, he thought.

'The dream seems less amusing when it is considered analytically. The "gentleman known to him" who entered the room was, in the latent dream thoughts, the picture of Death as the "great Unknown" – a picture which had been called up in his mind during the previous day. The old
[473] gentleman, who suffered from arteriosclerosis, had had good reason the day before for thinking of dying. The unrestrained laughter took the place of sobbing and weeping at the idea that he must die. It was the light of life that he could no longer turn on. This gloomy thought may have been connected with attempts at copulation which he had made shortly before but which had failed even with the help of his wife *en négligé*. He

1 [This paragraph and the next were added in 1919.]

realized that he was already going downhill. The dream-work succeeded in transforming the gloomy idea of impotence and death into a comic scene, and his sobs into laughter.'

There is one class of dreams which have a particular claim to be described as 'hypocritical' and which offer a hard test to the theory of wish fulfilment.[1] My attention was drawn to them when Frau Dr M. Hilferding brought up the following record of a dream of Peter Rosegger's for discussion by the Vienna Psychoanalytical Society.

Rosegger writes in his story 'Fremd gemacht'?[2]: 'As a rule I am a sound sleeper but many a night I have lost my rest – for, along with my modest career as a student and man of letters, I have for many years dragged around with me, like a ghost from which I could not set myself free, the shadow of a tailor's life.

'It is not as though in the daytime I had reflected very often or very intensely on my past. One who had cast off the skin of a Philistine and was seeking to conquer Earth and Heaven had other things to do. Nor would I, when I was a dashing young fellow, have given more than a thought to my nightly dreams. Only later, when the habit had come to me of reflecting upon everything, or when the Philistine within me began to stir a trifle, did I ask myself why it should be that, if I dreamt at all, I was always a journeyman tailor and that I spent so long a time as such with my master and worked without pay in his workshop. I knew well enough, as I sat like that beside him, sewing and ironing, that my right place was no longer there and that as a townsman I had other things to occupy me. But I was always on vacation, I was always having summer holidays, and so it was that I sat beside my master as his assistant. It often [474] irked me and I felt sad at the loss of time in which I might well have found better and more useful things to do. Now and then, when something went awry, I had to put up with a scolding from my master, though there was never any talk of wages. Often, as I sat there with bent back in the dark workshop, I thought of giving notice and taking my leave. Once I even did so; but my master paid no heed and I was soon sitting beside him again and sewing.

'After such tedious hours, what a joy it was to wake! And I determined that if this persistent dream should come again I would throw it from me with energy and call aloud: "This is mere hocus-pocus, I am lying in bed

1 [This paragraph and the following quotation from Rosegger, together with the discussion of it, were added in 1911. Rosegger (1843–1918) was a well-known Austrian writer who reached celebrity from very humble, peasant beginnings.]

2 ['Dismissed!'] In the second volume of *Waldheimat*, p. 303.

and want to sleep. . . .” But next night I was once more sitting in the tailor’s workshop.

‘And so it went on for years with uncanny regularity. Now it happened once that my master and I were working at Alpelhofer’s (the peasant in whose house I had worked when I was first apprenticed) and my master showed himself quite especially dissatisfied with my work. “I’d like to know where you’re wool-gathering,” he said, and looked at me darkly. The most reasonable thing to do, I thought, would be to stand up and tell him that I was only with him to please him and then go off. But I did not do so. I made no objection when my master took on an apprentice and ordered me to make room for him on the bench. I moved into the corner and sewed. The same day another journeyman was taken on as well, a canting hypocrite – he was a Bohemian – who had worked at our place nineteen years before, and had fallen into the brook once on his way back from the inn. When he looked for a seat there was no more room. I turned to my master questioningly, and he said to me: “You’ve no gift for tailoring, you can go! you’re dismissed!” My fright at this was so overpowering that I awoke.

‘The grey light of morning was glimmering through the uncurtained windows into my familiar home. Works of art surrounded me; there in my handsome bookcase stood the eternal Homer, the, gigantic Dante, the incomparable Shakespeare, the glorious Goethe – all the magnificent immortals. From the next room rang out the clear young voices of the awakening children joking with their mother. I felt as though I had found afresh this idyllically sweet, this peaceful, poetic, spiritual life in which I had so often and so deeply felt a meditative human happiness.
[475] Yet it vexed me that I had not been beforehand with my master in giving him notice, but had been dismissed by him.

‘And how astonished I was! From the night on which my master dismissed me, I enjoyed peace; I dreamt no more of the tailoring days which lay so far back in my past – days which had been so cheerfully unassuming but had thrown such a long shadow over my later years.’

In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish fulfilment. All the dreamer’s enjoyment lay in his daytime existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that

science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand, I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word '*analysis*', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are '*psycho*analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu's pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts [476] that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge.[1] But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more

1 [The last two sentences were added in 1919.]

than everything, *she* was once more young – the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: 'Things are going very well today and times were hard in the old days; all the same, it was lovely then – I was still young.'[1]

[477] Another group of dreams,[2] which I have often come across in myself and recognized as hypocritical, have as their content a reconciliation with people with whom friendly relations have long since ceased. In such cases analysis habitually reveals some occasion which might urge me to abandon the last remnant of consideration for these former friends and to treat them as strangers or enemies. The dream, however, prefers to depict the opposite relationship. [Cf. p. 128 f. *n*. above.]

In forming any judgement upon dreams recorded by an imaginative writer it is reasonable to suppose that he may have omitted from his account details in the content of the dream which he regards as unessential or distracting. His dreams will in that case raise problems which would be quickly solved if their content were reported in full.

Otto Rank has pointed out to me that the Grimm's fairy tale of 'The Little Tailor, or Seven at a Blow' contains a very similar dream of a parvenu. The tailor, who has become a hero and the son-in-law of the king, dreams one night of his former handicraft, as he lies beside his wife, the princess. She, becoming suspicious, posts armed guards the next night to listen to the dreamer's words and to arrest him. But the little tailor is warned, and sees to it that his dream is corrected.

The complicated process of elimination, diminution and reversal, by means of which the affects in the dream thoughts are eventually turned into those in the dream, can be satisfactorily followed in suitable

1 [*Footnote added* 1930:] Since psychoanalysis has divided the personality into an ego and a superego (Freud, 1921*c* [and 1923*b*]), it has become easy to recognize in these punishment dreams fulfilments of the wishes of the superego. [See below, p. 498 ff. – The Rosegger dreams are also discussed in Section IX of Freud, 1923*c*; *RSE*, **19**, 108 f.]

2 [This paragraph was added in 1919, and seems to have been wrongly interpolated at this point. It should probably have come *after* the two next paragraphs. These date from 1911, like the preceding Rosegger discussion, to which they are clearly related. What follows them goes back once more to 1900. – Some further remarks on hypocritical dreams can be found in Section III of Freud's paper on a case of female homosexuality (1920*a*), ibid., **18**, 155–6.]

syntheses of dreams that have been completely analysed. I will quote a few more examples of affects in dreams where some of the possibilities I have enumerated will be found realized.

v

If we turn back to the dream about the strange task set me by old Brücke of making a dissection of my own pelvis [p. 404 above], it will be recalled that in the dream itself I missed the gruesome feeling [*Grauen*] appropriate to it. Now this was a wish fulfilment in more than one sense. The dissection meant the self-analysis which I was carrying out, as it were, in the publication of this present book about dreams – a process which had been so distressing to me in reality that I had postponed the printing of the finished manuscript for more than a year. A wish then arose that I might get over this feeling of distaste; hence it was that I had no gruesome feeling [*Grauen*] in the dream. [478]
But I should also have been very glad to miss growing grey – '*Grauen*' in the other sense of the word. I was already growing quite grey, and the grey of my hair was another reminder that I must not delay any longer. And, as we have seen, the thought that I should have to leave it to my children to reach the goal of my difficult journey forced its way through to representation at the end of the dream.

Let us next consider the two dreams in which an expression of satisfaction was transposed to the moment after waking. In the one case the reason given for the satisfaction was an expectation that I should now discover what was meant by 'I've dreamt of that before', while the satisfaction really referred to the birth of my first children [p. 399 above]. In the other case the ostensible reason was my conviction that something that had been 'prognosticated' was now coming true, while the real reference was similar to that in the former dream: it was the satisfaction with which I greeted the birth of my second son [p. 399 f.]. Here the affects which dominated the dream thoughts persisted in the dreams; but it is safe to say that in *no* dream can things be as simple as all that. If we go a little more deeply into the two analyses we find that this satisfaction which had escaped censorship had received an accession from another source. This other source had grounds for fearing the censorship, and its affect would undoubtedly have aroused opposition if it had not covered itself by the similar, legitimate affect of satisfaction, arising from the permissible source, and slipped in, as it were, under its wing.

Unfortunately, I cannot demonstrate this in the actual case of these dreams, but an instance taken from another department of life will make my meaning clear. Let us suppose the following case. There is a person of my acquaintance whom I hate, so that I have a lively inclination to feel glad if anything goes wrong with him. But the moral side of my nature will not give way to this impulse. I do not dare to express a wish that he should be unlucky, and if he meets with some undeserved misfortune, I suppress my satisfaction at it and force myself to manifestations and thoughts of regret. Everyone must have found himself in this situation at some time or other. What now happens, however, is
[479] that the hated person, by a piece of misconduct of his own, involves himself in some well-deserved unpleasantness; when that happens, I may give free rein to my satisfaction that he has met with a just punishment and in this I find myself in agreement with many other people who are impartial. I may observe, however, that my satisfaction seems more intense than that of these other people; it has received an accession from the source of my hatred, which till then has been prevented from producing its affect, but in the altered circumstances is no longer hindered from doing so. In social life this occurs in general wherever antipathetic people or members of an unpopular minority put themselves in the wrong. Their punishment does not as a rule correspond to their wrongdoing but to their wrongdoing *plus* the ill-feeling directed against them which has previously been without any consequences. It is no doubt true that those who inflict the punishment are committing an injustice in this; but they are prevented from perceiving it by the satisfaction resulting from the removal of a suppression which has long been maintained within them. In cases such as this the affect is justified in its *quality* but not in its *amount*; and self-criticism which is set at rest on the one point is only too apt to neglect examination of the second one. When once a door has been opened, it is easy for more people to push their way through it than there had originally been any intention of letting in.

A striking feature in neurotic characters – the fact that a cause capable of releasing an affect is apt to produce in them a result which is qualitatively justified but quantitatively excessive – is to be explained along these same lines, insofar as it admits of any psychological explanation at all. The excess arises from sources of affect which had previously remained unconscious and suppressed. These sources have succeeded in setting up an associative link with the *real* releasing cause, and the desired path from the release of their own affect has been opened by the

other source of affect, which is unobjectionable and legitimate. Our attention is thus drawn to the fact that in considering the suppressed and suppressing agencies, we must not regard their relation as being exclusively one of mutual inhibition. Just as much regard must be paid to cases in which the two agencies bring about a pathological effect by working side by side and by intensifying each other.

Let us now apply these hints upon psychical mechanisms to an understanding of the expressions of affect in *dreams*. A satisfaction which is exhibited in a dream and can, of course, be immediately referred to its proper place in the dream thoughts is not always completely elucidated by this reference alone. It is as a rule necessary to look for *another* source of it in the dream thoughts, a source which is under the pressure of the censorship. As a result of that pressure, this source would normally have produced, not satisfaction, but the contrary affect. Owing to the presence of the first source of affect, however, the second source is enabled to withdraw its affect of satisfaction from repression and allow it to act as an intensification of the satisfaction from the first source. Thus it appears that affects in dreams are fed from a confluence of several sources and are overdetermined in their reference to the material of the dream thoughts. *During the dream-work, sources of affect which are capable of producing the same affect come together in generating it*.[1] [480]

We can gain a little insight into these complications from the analysis of that fine specimen of a dream of which the words '*Non vixit*' formed the centre point. (See p. 376 ff.) In that dream manifestations of affect of various qualities were brought together at two points in its manifest content. Hostile and distressing feelings – 'overcome by strange emotions' were the words used in the dream itself – were piled up at the point at which I annihilated my opponent and friend with two words. And again, at the end of the dream, I was highly delighted, and I went on to approve the possibility, which in waking life I knew was absurd, of there being *revenants* who could be eliminated by a mere wish.

I have not yet related the exciting cause of the dream. It was of great importance and led deep into an understanding of the dream. I had heard from my friend in Berlin, whom I have referred to as 'Fl.' [i.e. Fliess], that he was about to undergo an operation and that I should get further news of his condition from some of his relatives in Vienna. The first reports I received after the operation were not reassuring and made me

1 [*Footnote added* 1909:] I have given an analogous explanation of the extraordinarily powerful pleasurable effect of tendentious jokes. [Freud, 1905*c*, in Chapter IV; *RSE*, **8**, 120 f.]

feel anxious. I should have much preferred to go to him myself, but just
[481] at that time I was the victim of a painful complaint which made movement of any kind a torture to me. The dream thoughts now informed me that I feared for my friend's life. His only sister, whom I had never known, had, as I was aware, died in early youth after a very brief illness. (In the dream *Fl. spoke about his sister and said that in three-quarters of an hour she was dead*.) I must have imagined that his constitution was not much more resistant than his sister's and that, after getting some much worse news of him, I should make the journey after all – and arrive *too late*, for which I might never cease to reproach myself.[1] This reproach for coming too late became the central point of the dream but was represented by a scene in which Brücke, the honoured teacher of my student years, levelled this reproach at me with a terrible look from his blue eyes. It will soon appear what it was that caused the situation [in regard to Fl.] to be switched on to these lines. The scene [with Brücke] itself could not be reproduced by the dream in the form in which I experienced it. The other figure in the dream was allowed to keep the blue eyes, but the annihilating role was allotted to me – a reversal which was obviously the work of wish fulfilment. My anxiety about my friend's recovery, my self-reproaches for not going to see him, the shame I felt about this – *he had come to Vienna* (to see me) '*unobtrusively*' – the need I felt to consider that I was excused by my illness – all of this combined to produce the emotional storm which was clearly perceived in my sleep and which raged in this region of the dream thoughts.

But there was something else in the exciting cause of the dream, which had a quite opposite effect upon me. Along with the unfavourable reports during the first few days after the operation, I was given a warning not to discuss the matter with anyone. I had felt offended by this because it implied an unnecessary distrust of my discretion. I was quite aware that these instructions had not emanated from my friend but were due to tactlessness or overanxiety on the part of the intermediary, but I was very disagreeably affected by the veiled reproach because it was – not
[482] wholly without justification. As we all know, it is only reproaches which have something in them that 'stick'; it is only they that upset us. What I have in mind does not relate, it is true, to this friend, but to a much earlier period of my life. On that occasion I caused trouble between two friends (both of whom had chosen to honour me, too, with that name) by quite

1 It was this phantasy [*Phantasie*]^{T}, forming part of the unconscious dream thoughts, which so insistently demanded '*Non vivit*' instead of '*Non vixit*': 'You have come too late, he is no longer alive.' I have already explained on p. 377 above that '*Non vivit*' was also required by the *manifest* situation in the dream.

unnecessarily telling one of them, in the course of conversation, what the other had said about him. At that time, too, reproaches had been levelled at me, and they were still in my memory. One of the two friends concerned was Professor Fleischl; I may describe the other by his first name of 'Josef' – which was also that of P., my friend and opponent in the dream.[1]

The reproach of being unable to keep anything to myself was attested in the dream by the element 'unobtrusive' and by Fl.'s question as to *how much I had told P. about his affairs*. But it was the intervention of this memory [of my early indiscretion and its consequences] that transported the reproach against me for coming too late from the present time to the period at which I had worked in Brücke's laboratory. And, by turning the second person in the scene of annihilation in the dream into a Josef, I made the scene represent not only the reproach against me for coming too late but also the far more strongly repressed reproach that I was unable to keep a secret. Here the processes of condensation and displacement at work in the dream, as well as the reasons for them, are strikingly visible.

My present-day anger, which was only slight, over the warning I had been given not to give anything away [about Fl.'s illness] received reinforcements from sources in the depth of my mind and thus swelled into a current of hostile feelings against persons of whom I was in reality [483] fond. The source of this reinforcement flowed from my childhood. I have already shown [p. 379 above] how my warm friendships as well as my enmities with contemporaries went back to my relations in childhood with a nephew who was a year my senior; how he was my superior, how I early learnt to defend myself against him, how we were inseparable friends, and how, according to the testimony of our elders, we sometimes fought with each other and – made complaints to them about each other. All my friends have in a certain sense been reincarnations of this first figure who 'früh sich einst dem trüben Blick gezeigt':[2] they have been *revenants*. My nephew himself reappeared in my boyhood, and at that time we acted the parts of Caesar and Brutus together. My

1 [What follows will be made more intelligible by some facts derived from a paper by Bernfeld (1944). Freud worked at the Vienna Physiological Institute ('Brücke's laboratory') from 1876 to 1882. Ernst Brücke (1819–92) was at its head; his two assistants in Freud's time were Sigmund Exner (1846–1925) and Ernst Fleischl von Marxow (1846–91), both some ten years older than Freud. Fleischl suffered from a very severe physical affliction during the later years of his life. It was at the Physiological Institute that Freud met Josef Breuer (1842–1925), his greatly senior collaborator in *Studies on Hysteria* (1895*d*) and the second Josef in the present analysis. The first Josef – Freud's early deceased 'friend and opponent P.' – was Josef Paneth (1857–90), who succeeded to Freud's position at the Institute. – See also the first volume of Ernest Jones's Freud biography (1953).]

2 ['. . . long since appeared before my troubled gaze' (Goethe, *Faust*, Dedication).]

emotional life has always insisted that I should have an intimate friend and a hated enemy. I have always been able to provide myself afresh with both, and it has not infrequently happened that the ideal situation of childhood has been so completely reproduced that friend and enemy have come together in a single individual – though not, of course, both at once or with constant oscillations, as may have been the case in my early childhood.

I do not propose at this point to discuss how it is that in such circumstances as these a recent occasion for the generation of an affect can hark back to an infantile situation and be replaced by that situation as far as the production of affect is concerned. [See p. 488 below.] This question forms part of the psychology of unconscious thinking, and would find its proper place in a psychological elucidation of the neuroses. For the purposes of dream interpretation let us assume that a childhood memory arose, or was constructed in phantasy, with some such content as the following. The two children had a dispute about some object. (What the object was may be left an open question, though the memory or pseudo-memory had a quite specific one in view.) Each of them claimed to have *got there before the other* and therefore to have a better right to it. They came to blows and might prevailed over right. On the evidence of the dream, I may myself have been aware that I was in the wrong ('*I myself noticed the mistake*'). However, this time I was the stronger and remained in pos-
[484] session of the field. The vanquished party hurried to his grandfather – my father – and complained about me, and I defended myself in the words which I know from my father's account: 'I hit him 'cos he hit me.' This memory, or more probably phantasy, which came into my mind while I was analysing the dream – without further evidence I myself could not tell how[1] – constituted an intermediate element in the dream thoughts, which gathered up the emotions raging in them as a well collects the water that flows into it. From this point the dream thoughts proceeded along some such lines as these: 'It serves you right if you had to make way for me. Why did you try to push *me* out of the way? I don't need you, I can easily find someone else to play with,' and so on. These thoughts now entered upon the paths which led to their representation in the dream. There had been a time when I had had to reproach my friend Josef [P.] for an attitude of this same kind: '*Ôte-toi que je m'y mette!*' He had followed in my footsteps as demonstrator in Brücke's laboratory, but promotion there was

1 [This point is discussed below on p. 459.]

slow and tedious. Neither of Brücke's two assistants was inclined to budge from his place, and youth was impatient. My friend, who knew that he could not expect to live long, and for whom no bonds of intimacy attached to his immediate superior, sometimes gave loud expression to his impatience, and, since this superior [Fleischl] was seriously ill, P.'s wish to have him out of the way might have an uglier meaning than the mere hope for the man's promotion. Not unnaturally, a few years earlier, I myself had nourished a still livelier wish to fill a vacancy. Wherever there is rank and promotion the way lies open for wishes that call for suppression. Shakespeare's Prince Hal could not, even at his father's sick-bed, resist the temptation of trying on the crown.[1] But, as was to be expected, the dream punished my friend, and not me, for this callous wish.[2]

'As he was ambitious, I slew him.'[3] As he could not wait for the removal of another man, he was himself removed. These had been my thoughts immediately after I attended the unveiling at the university of the memorial – not to him but to the other man. Thus a part of the satisfaction I felt in the dream was to be interpreted: 'A just punishment! [485]
It serves you right!'

At my friend's [P.'s] funeral, a young man had made what seemed to be an inopportune remark to the effect that the speaker who had delivered the funeral oration had implied that without this one man the world would come to an end. He was expressing the honest feelings of someone whose pain was being interfered with by an exaggeration. But this remark of his was the starting point of the following dream thoughts: 'It's quite true that no-one's irreplaceable. How many people I've followed to the grave already! But I'm still alive. I've survived them all; I'm left in possession of the field.' A thought of this kind, occurring to me at a moment at which I was afraid I might not find my friend [Fl.] alive if I made the journey to him, could only be construed as meaning that I was delighted because I had once more survived someone, because it was *he* and not I who had died, because I was left in possession of the field, as I had been in the phantasied scene from my childhood. This satisfaction, infantile in origin, at being in possession of the field constituted the major part of the affect that appeared in the dream. I was delighted to survive, and I gave expression to my delight with all the naive egoism

1 [*Henry IV*, *Part II*, Act IV, Sc. 5.]

2 It will be noticed that the name Josef plays a great part in my dreams (cf. the dream about my uncle [p. 122 ff. above]). My own ego finds it very easy to hide itself behind people of that name, since Joseph was the name of a man famous in the Bible as an interpreter of dreams.

3 [Brutus' words, in *Julius Caesar*, Act III, Sc. 2.]

shown in the anecdote of the married couple one of whom said to the other: 'If one of us dies, I shall move to Paris.' So obvious was it to me that I should not be the one to die.[1]

It cannot be denied that to interpret and report one's dreams demands a high degree of self-discipline. One is bound to emerge as the only villain among the crowd of noble characters who share one's life. Thus it seemed to me quite natural that the *revenants* should only exist for just so long as one likes and should be removable at a wish. We have seen what my friend Josef was punished for. But the *revenants* were a series of reincarnations of the friend of my childhood. It was therefore also a source of satisfaction to me that I had always been able to find successive substitutes for that figure; and I felt I should be able to find a substitute for the friend whom I was now on the point of losing: no-one was irreplaceable.

But what had become of the dream censorship? Why had it not raised the most energetic objections against this blatantly egoistic train of thought? And why had it not transformed the satisfaction attached
[486] to that train of thought into severe unpleasure? The explanation was, I think, that other, unobjectionable, trains of thought in connection with the same people found simultaneous satisfaction and screened with *their* affect the affect which arose from the forbidden infantile source. In another stratum of my thoughts, during the ceremonial unveiling of the memorial, I had reflected thus: 'What a number of valued friends I have lost, some through death, some through a breach of our friendship! How fortunate that I have found a substitute for them and that I have gained one who means more to me than ever the others could, and that, at a time of life when new friendships cannot easily be formed, I shall never lose his!' My satisfaction at having found a substitute for these lost friends could be allowed to enter the dream without interference; but there slipped in, along with it, the hostile satisfaction derived from the infantile source. It is no doubt true that infantile affection served to reinforce my contemporary and justified affection. But infantile hatred, too, succeeded in getting itself represented.

In addition to this, however, the dream contained a clear allusion to another train of thought which could legitimately lead to satisfaction. A short time before, after long expectation, a daughter had been born to my friend [Fl.]. I was aware of how deeply he had mourned the

1 [The anecdote about moving to Paris was quoted by Freud again in the second section of his paper 'Thoughts for the Times on War and Death' (1915*b*), *RSE*, **14**, 297.]

sister he had so early lost and I wrote and told him I was sure he would transfer the love he felt for her on to the child, and that the baby girl would allow him at last to forget his irreparable loss.

Thus this group of thoughts was connected once again with the intermediate thought in the latent content of the dream [cf. pp. 431–2 above] from which the associative paths diverged in contrary directions: 'No-one is irreplaceable!' 'There are nothing but *revenants*: all those we have lost come back!' And now the associative links between the contradictory components of the dream thoughts were drawn closer by the chance fact that my friend's baby daughter had the same name as the little girl I used to play with as a child, who was of my age and the sister of my earliest friend and opponent. [See p. 379 *n.* 3.] It gave me great *satisfaction* when I heard that the baby was to be called 'Pauline'. And as an allusion to this coincidence, I had replaced one Josef with another in the dream and found it impossible to suppress the similarity between the opening letters of the names 'Fleischl' and 'Fl.'. From here my thoughts went on to the subject of the names of my own children. I [487] had insisted on their names being chosen, not according to the fashion of the moment, but in memory of people I have been fond of. Their names made the children into *revenants*. And after all, I reflected, was not having children our only path to immortality?

I have only a few more remarks to add on the subject of affect in dreams from another point of view. A dominating element in a sleeper's mind may be constituted by what we call a 'mood' – or *tendency* to some affect – and this may then have a determining influence upon his dreams. A mood of this kind may arise from his experiences or thoughts during the preceding day, or its sources may be somatic. [Cf. p. 210 f. above.] In either case it will be accompanied by the trains of thought appropriate to it. From the point of view of dream construction [*Traumbildung*][T] it is a *Bildung* matter of indifference whether, as sometimes happens, these ideational contents of the dream thoughts determine the mood in a primary fashion, or whether they are themselves aroused secondarily by the dreamer's emotional disposition which is in its turn to be explained on a somatic basis. In any case the construction of dreams is subject to the condition that it can only represent something which is the fulfilment of a wish and that it is only from wishes that it can derive its psychical driving force [*Triebkraft*]. A currently active mood is treated in the same way as a sensation arising and becoming currently active during sleep (cf. p. 208 f.), which can be either disregarded or given a fresh interpretation in the

sense of a wish fulfilment. Distressing moods during sleep can become the driving force [*Triebkräften*] of a dream by arousing energetic wishes which the dream is supposed to fulfil. The material to which moods are attached is worked over until it can be used to express the fulfilment of a wish. The more intense and dominating a part is played in the dream thoughts by the distressing mood, the more certain it becomes that the most strongly suppressed wishful impulses will make use of the opportunity in order to achieve representation. For, since the unpleasure which they would otherwise necessarily produce themselves is already present, they find the harder part of their task – the task of forcing their way through to representation – already accomplished for them. Here once more we are brought up against the problem of anxiety dreams; and these, as we shall find, form a marginal case in the function of dreaming. [Cf. p. 519 ff. below.]

(I)
SECONDARY REVISION[1]

And now at last we can turn to the fourth of the factors concerned in the [488]
construction of dreams. If we pursue our investigation of the content of dreams in the manner in which we have begun it – that is, by comparing conspicuous events in the dream content with their sources in the dream thoughts, we shall come upon elements the explanation of which calls for an entirely new assumption. What I have in mind are cases in which the dreamer is surprised, annoyed or repelled in the dream, and, moreover, by a piece of the dream content itself. As I have shown in a number of instances [in the last section], the majority of these critical feelings in dreams are not in fact directed against the content of the dream, but turn out to be portions of the dream thoughts which have been taken over and used to an appropriate end. But some material of this kind does not lend itself to this explanation; its correlate in the material of the dream thoughts is nowhere to be found. What, for instance, is the meaning of a critical remark found so often in dreams: 'This is only a dream'? [See p. 301 above.] Here we have a genuine piece of criticism of the dream, such as might be made in waking life. Quite frequently, too, it is actually a prelude to waking up; and still more frequently it has been preceded by some distressing feeling which is set at rest by the recognition that the state is one of dreaming. When the thought 'this is only a dream' occurs during a dream, it has the same purpose in view as when the words are pronounced on the stage by *la belle Hélène* in Offenbach's comic opera of that name:[2] it is aimed at reducing the importance of what has just been experienced and at making it possible to tolerate what is to follow. It serves to lull a particular agency to sleep which would have every reason at that moment to bestir itself and forbid the continuance of the dream – or the scene in the opera. It is more comfortable, however, [489]
to go on sleeping and tolerate the dream, because, after all, 'it *is* only a dream'. In my view the contemptuous critical judgement, 'it's only a dream', appears in a dream when the censorship, which is never quite asleep, feels that it has been taken unawares by a dream which has already been allowed through. It is too late to suppress it, and accordingly the

1 ['*Sekundäre Bearbeitung*.' This term has previously been given the somewhat misleading English rendering of 'secondary elaboration'.]

2 [In the love duet between Paris and Helen in the second act, at the end of which they are surprised by Menelaus.]

censorship uses these words to meet the anxiety or the distressing feeling aroused by it. The phrase is an example of *esprit d'escalier* on the part of the psychical censorship.

This instance, however, provides us with convincing evidence that not everything contained in a dream is derived from the dream thoughts, but that contributions to its content may be made by a psychical function which is indistinguishable from our waking thoughts. The question now arises whether this only occurs in exceptional cases, or whether the psychical agency which otherwise operates only as a censorship plays a *habitual* part in the construction of dreams.

We can have no hesitation in deciding in favour of the second alternative. There can be no doubt that the censoring agency, whose influence we have so far only recognized in limitations and omissions in the dream content, is also responsible for interpolations and additions in it. The interpolations are easy to recognize. They are often reported with hesitation, and introduced by an 'as though'; they are not in themselves particularly vivid and are always introduced at points at which they can serve as links between two portions of the dream content or to bridge a gap between two parts of the dream. They are less easily retained in the memory than genuine derivatives of the material of the dream thoughts; if the dream is to be forgotten they are the first part of it to disappear, and I have a strong suspicion that the common complaint of having dreamt a lot, but of having forgotten most of it and of having only retained fragments [p. 248 above], is based upon the rapid disappearance precisely of these connecting thoughts. In a complete analysis these interpolations are sometimes betrayed by the fact that no material connected with them is to be found in the dream thoughts. But careful examination leads me to regard this as the less frequent case; as a rule the connecting thoughts lead back nevertheless to material in the dream thoughts, but to material which could have no claim to acceptance in the dream either on its own account or owing to its being
[490] overdetermined. Only in extreme cases, it seems, does the psychical function in dream formation which we are now considering proceed to make new creations. So long as possible, it employs anything appropriate that it can find in the material of the dream thoughts.

The thing that distinguishes and at the same time reveals this part of the dream-work[1] is its *purpose*. This function behaves in the manner

1 [Elsewhere, Freud remarks that, strictly speaking, 'secondary revision' is *not* a part of the dream-work. Cf. his article on 'Psychoanalysis' in Marcuse's *Handwörterbuch* (Freud, 1923*a*; *RSE*, **18**, 235.) This same point is also mentioned in Freud (1913*a*), ibid., **12**, 272.]

which the poet maliciously ascribes to philosophers: it fills in the gaps in the dream structure with shreds and patches.[1] As a result of its efforts, the dream loses its appearance of absurdity and disconnectedness and approximates to the model of an intelligible experience. But its efforts are not always crowned with success. Dreams occur which, at a superficial view, may seem faultlessly logical and reasonable; they start from a possible situation, carry it on through a chain of consistent modifications and – though far less frequently – bring it to a conclusion which causes no surprise. Dreams which are of such a kind have been subjected to a far-reaching revision by this psychical function that is akin to waking thought; they appear to have a meaning, but that meaning is as far removed as possible from their true significance. If we analyse them, we can convince ourselves that it is in these dreams that the secondary revision has played about with the material the most freely, and has retained the relations present in that material to the least extent. They are dreams which might be said to have been already interpreted once, before being submitted to waking interpretation.[2] In other dreams this tendentious revision has only partly succeeded; coherence seems to rule for a certain distance, but the dream then becomes senseless or confused, while perhaps later on in its course it may for a second time present an appearance of rationality. In yet other dreams the revision has failed altogether; we find ourselves helplessly face to face with a meaningless heap of fragmentary material.

I do not wish to deny categorically that this fourth power in dream construction – which we shall soon recognize as an old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections – I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream – the case, namely, in which a formation of that kind already exists, available for use in the material of the dream thoughts. I am in the habit of describing the element in the dream thoughts which I have in mind as a 'phantasy'.[3] I shall perhaps avoid misunderstanding if I mention the [491]

1 [An allusion to some lines in Heine's 'Die Heimkehr' (LVIII). The whole passage is quoted by Freud near the beginning of the last of his *New Introductory Lectures* (1933*a*), *RSE*, **22**, 141.]

2 [See, for instance, the dreams recorded on pp. 442 and 521 f. below.]

3 ['*Phantasie*.' This German word was earlier used only to mean 'imagination'; '*Phantasiebildung*' ('imaginative formation') would have been used here. See *RSE*, **24**, 79–80, for a full discussion.]

'daydream' as something analogous to it in waking life.[1] The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction.[2] The importance of daydreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in *Le Nabab* of the daydreams of one of the minor characters in that story. [Cf. p. 477 below.] The study of the psychoneuroses leads to the surprising discovery that these phantasies or daydreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of memories.[3] The frequent occurrence of
[492] conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these daytime phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night – the name, that is, of 'dreams'. They share a large number of their properties with night dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night dreams.

Like dreams, they are wish fulfilments; like dreams, they are based to a great extent on impressions of infantile experiences; like dreams, they benefit by a certain degree of relaxation of censorship. If we examine their structure, we shall perceive the way in which the wishful purpose that is at work in their production has mixed up the material of which they are built, has rearranged it and has formed it into a new whole. They stand in much the same relation to the childhood memories from which they are derived as do some of the Baroque palaces of Rome to the ancient ruins whose pavements and columns have provided the material for the more recent structures.

1 '*Rêve*', '*petit roman*' – 'daydream', '[continuous] story'. [These last words are in English in the original. The term '*Tagtraum*', used in the text above, was unfamiliar to German readers and called for elucidation.]

2 [Freud himself later devoted two papers to the subject of daydreams: 1908*a* and 1908*e*. In 1921, *The Psychology of Day-dreams* was published by J. Varendonck, to which Freud provided an Introduction (Freud, 1921*b*; *RSE*, **18**).]

3 [This was expressed by Freud more trenchantly in a memorandum accompanying his letter to Fliess of May 2, 1897 (Freud, 1950*a*, Draft L): 'Phantasies are psychical façades constructed in order to bar the way to these memories [of primal scenes].']

The function of 'secondary revision', which we have attributed to the fourth of the factors concerned in shaping the content of dreams, shows us in operation once more the activity which is able to find free vent in the creation of daydreams without being inhibited by any other influences. We might put it simply by saying that this fourth factor of ours seeks to mould the material offered to it into something like a daydream. If, however, a daydream of this kind has already been formed within the nexus of the dream thoughts, this fourth factor in the dream-work will prefer to take possession of the ready-made daydream and seek to introduce it into the content of the dream. There are some dreams which consist merely in the repetition of a daytime phantasy which may perhaps have remained unconscious:[1] such, for instance, as the boy's dream of driving in a war chariot with the heroes of the Trojan War [p. 115 above]. In my 'Autodidasker' dream [p. 266 ff.] the second part at all events was a faithful reproduction of a daytime phantasy, innocent in itself, of a conversation with Professor N. In view of the complicated conditions which a dream has to satisfy when it comes into existence, it happens more frequently that the ready-made phantasy forms only a *portion* of the dream, or that only a portion of the phantasy forces its way into the dream. Thereafter, the phantasy is treated in general like any other portion of the latent material, though it often remains recognizable as an entity in the dream. There are often parts of my dreams which stand out as producing a different impression from the rest. They strike me as being, as it were, more fluent, more connected and at the same time more fleeting than other parts of the same dream. These, I know, are unconscious phantasies which have found their way into the fabric of the dream, but I have never succeeded in pinning down a phantasy of this kind. Apart from this, these phantasies, like any other component of the dream thoughts, are compressed, condensed, superimposed on one another, and so on. There are, however, transitional cases, between the case in which they constitute the content (or at least the façade) of the dream unaltered and the extreme opposite, in which they are represented in the content of the dream only by *one* of their elements or by a distant allusion. What happens to phantasies present in the dream thoughts is evidently also determined by any advantages they may have to offer the requirements of the censorship and of the urge towards condensation. [493]

1 [Cf. the long footnote to the section on 'The Barrier against Incest' in the third of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 199 f. *n.* 3. This footnote was added in the fourth edition of that book (1920).]

In selecting examples of dream interpretation I have so far as possible avoided dreams in which unconscious phantasies play any considerable part, because the introduction of this particular psychical element would have necessitated lengthy discussions on the psychology of unconscious thinking. Nevertheless, I cannot completely escape a consideration of phantasies in this connection, since they often make their way complete into dreams and since still more often clear glimpses of them can be seen behind the dream. I will therefore quote one more dream, which seems to be composed of two different and opposing phantasies which coincide with each other at a few points and of which one is superficial while the second is, as it were, an interpretation of the first. [See above, p. 439.][1]

[494]

The dream – it is the only one of which I possess no careful notes – ran roughly as follows. The dreamer, a young unmarried man, was sitting in the restaurant at which he usually ate and which was presented realistically in the dream. Several people then appeared, in order to fetch him away, and one of them wanted to arrest him. He said to his companions at table: 'I'll pay later; I'll come back.' But they exclaimed with derisive smiles: 'We know all about that; that's what they all say!' One of the guests called out after him: 'There goes another one!' He was then led into a narrow room in which he found a female figure carrying a child. One of the people accompanying him said: 'This is Herr Müller.' A police inspector, or some such official, was turning over a bundle of cards or papers and as he did so repeated 'Müller, Müller, Müller.' Finally he asked the dreamer a question, which he answered with an 'I will'. He then turned round to look at the female figure and observed that she was now wearing a big beard.

Here there is no difficulty in separating the two components. The superficial one was a *phantasy of arrest* which appears as though it had been freshly constructed by the dream-work. But behind it some material is visible which had been only slightly reshaped by the dream-work: *a phantasy of marriage*. Those features which were common to both phantasies emerge with special clarity, in the same way as in one of Galton's composite photographs. The promise made by the young man (who up

1 [*Footnote added* 1909:] In my 'Fragment of an Analysis of a Case of Hysteria' (1905*e* [*RSE*, 7, 57 ff.]), I have analysed a good specimen of a dream of this sort, made up of a number of superimposed phantasies. Incidentally, I underestimated the importance of the part played by these phantasies in the formation of dreams so long as I was principally working on my own dreams, which are usually based on discussions and conflicts of thought and comparatively rarely on daydreams. In the case of other people it is often much easier to demonstrate the complete analogy between night dreams and daydreams. With hysterical patients, a hysterical attack can often be replaced by a dream; and it is then easy to convince oneself that the immediate forerunner of *both* these psychical structures was a daydream phantasy.

till then had been a bachelor) that he would come back and join his fellow diners at their table, the scepticism of his boon-companions (whom experience had taught better), the exclamation 'there goes another one [495]
(to get married)' – all of these features fitted in easily with the alternative interpretation. So, too, did the 'I will' with which he replied to the official's question. The turning over the bundle of papers, with the constant repetition of the same name, corresponded to a less important but recognizable feature of wedding festivities, namely the reading out of a bundle of telegrams of congratulation, all of them with addresses bearing the same names. The phantasy of marriage actually scored a victory over the covering phantasy of arrest in the fact of the bride's making a personal appearance in the dream. I was able to discover from an enquiry – the dream was not analysed – why it was that at the end of it the bride wore a beard. On the previous day the dreamer had been walking in the street with a friend who was as shy of marrying as he was himself, and he had drawn his friend's attention to a dark-haired beauty who had passed them. 'Yes,' his friend had remarked, 'if only women like that didn't grow beards like their fathers' in a few years' time.' This dream did not, of course, lack elements in which dream distortion had been carried deeper. It may well be, for instance, that the words 'I'll pay later' referred to what he feared might be his father-in-law's attitude on the subject of a dowry. In fact, all kinds of qualms were evidently preventing the dreamer from throwing himself into the phantasy of marriage with any enjoyment. One of these qualms, a fear that marriage might cost him his freedom, was embodied in the transformation into a scene of arrest.

If we return for a moment to the point that the dream-work is glad to make use of a ready-made phantasy instead of putting one together out of the material of the dream thoughts, we may perhaps find ourselves in a position to solve one of the most interesting puzzles connected with dreams. On p. 24 I told the well-known anecdote of how Maury, having been struck in his sleep on the back of his neck by a piece of wood, woke up from a long dream which was like a full-length story set in the days of the French Revolution. Since the dream, as reported, was a coherent one and was planned entirely with an eye to providing an explanation of the stimulus which woke him and whose occurrence he could not have anticipated, the only possible hypothesis seems to be that the whole elaborate dream must have been composed and must have taken place during the [496]
short period of time between the contact of the board with Maury's cervical vertebrae and his consequent awakening. We should

never dare to attribute such rapidity to thought activity in waking life, and we should therefore be driven to conclude that the dream-work possesses the advantage of accelerating our thought processes to a remarkable degree.

Strong objections have been raised to what quickly became a popular conclusion by some more recent writers (Le Lorrain, 1894 and 1895, Egger, 1895, and others). On the one hand, they throw doubts upon the accuracy of Maury's account of his dream; and, on the other hand, they attempt to show that the rapidity of the operations of our waking thoughts is no less than in this dream when exaggerations have been discounted. The discussion raised questions of principle which do not seem to me immediately soluble. But I must confess that the arguments brought forward (by Egger, for instance), particularly against Maury's guillotine dream, leave me unconvinced. I myself would propose the following explanation of this dream. Is it so highly improbable that Maury's dream represents a phantasy which had been stored up ready-made in his memory for many years and which was aroused – or I would rather say 'alluded to' – at the moment at which he became aware of the stimulus which woke him? If this were so, we should have escaped the whole difficulty of understanding how such a long story with all its details could have been composed in the extremely short period of time which was at the dreamer's disposal – for the story would have been composed already. If the piece of wood had struck the back of Maury's neck while he was awake, there would have been an opportunity for some such thought as: 'That's just like being guillotined.' But since it was in his sleep that he was struck by the board, the dream-work made use of the impinging stimulus in order rapidly to produce a wish fulfilment; it was *as though* it thought (this is to be taken purely figuratively): 'Here's a good opportunity of realizing a wishful phantasy which was formed at such and such a time in the course of reading.' It can hardly be disputed, I think, that the dream story was precisely of a sort likely to be constructed by a young man under the influence of powerfully exciting impressions. Who – least of all what Frenchman or student of the history of civilization [*Kulturhistoriker*] – could fail to be gripped by narratives of the Reign of Terror,
[497] when the men and women of the aristocracy, the flower of the nation, showed that they could die with a cheerful mind and could retain the liveliness of their wit and the elegance of their manners till the very moment of the fatal summons? How tempting for a young man to plunge into all this in his imagination – to picture himself bidding a lady farewell – kissing her hand and mounting the scaffold unafraid! Or, if

ambition were the prime motive of the phantasy, how tempting for him to take the place of one of those formidable figures who, by the power alone of their thoughts and flaming eloquence, ruled the city in which the heart of humanity beat convulsively in those days – who were led by their convictions to send thousands of men to their death and who prepared the way for the transformation of Europe, while all the time their own heads were insecure and destined to fall one day beneath the knife of the guillotine – how tempting to picture himself as one of the Girondists, perhaps, or as the heroic Danton! There is one feature in Maury's recollection of the dream, his being 'led to the place of execution, surrounded by an immense mob', which seems to suggest that his phantasy was, in fact, of this ambitious type.

Nor is it necessary that this long-prepared phantasy should have been gone through during sleep; it would have been sufficient for it to be merely touched on. What I mean is this. If a few bars of music are played and someone comments that it is from Mozart's *Figaro* (as happens in *Don Giovanni*) a number of recollections are roused in me all at once, none of which can enter my consciousness singly at the first moment. The key phrase serves as a port of entry through which the whole network is simultaneously put in a state of excitation. It may well be the same in the case of unconscious thinking. The rousing stimulus excites the psychical port of entry which allows access to the whole guillotine phantasy. But the phantasy is not gone through during sleep but only in the recollection of the sleeper after his awakening. After waking he remembers in all its details the phantasy which was stirred up as a whole in his dream. One has no means of assuring oneself in such a case that one is really remembering something one has dreamt. This same explanation – that it is a question of ready-made phantasies which are brought into excitation as a whole by the rousing stimulus – can be applied to other dreams which are focused upon a rousing stimulus, such, for instance, as Napoleon's battle dream before the explosion of the infernal machine [pp. 24 and 207 f. above]. [498]

Among the dreams[1] collected by Justine Tobowolska in her dissertation on the apparent passage of time in dreams, the most informative seems to me to be the one reported by Macario (1857, 46) as having been dreamt by a dramatic author, Casimir Bonjour (Tobowolska [1900], 53). One evening Bonjour wanted to attend the first performance of one of

1 [This paragraph was added in 1914 with the exception of the last sentence, which appeared in the original edition.]

his pieces; but he was so fatigued that as he was sitting behind the scenes he dozed off just at the moment the curtain went up. During his sleep he went through the whole five acts of the play, and observed all the various signs of emotion shown by the audience during the different scenes. At the end of the performance he was delighted to hear his name being shouted with the liveliest demonstrations of applause. Suddenly he woke up. He could not believe either his eyes or his ears, for the performance had not gone beyond the first few lines of the first scene; he could not have been asleep for longer than two minutes. It is surely not too rash to suppose in the case of this dream that the dreamer's going through all five acts of the play and observing the attitude of the public to different passages in it need not have arisen from any fresh production of material during his sleep, but may have reproduced a piece of phantasy activity (in the sense I have described) which had already been completed. Tobowolska, like other writers, emphasizes the fact that dreams with an accelerated passage of ideas have the common characteristic of seeming specially coherent, quite unlike other dreams, and that the recollection of them is summary far more than detailed. This would indeed be a characteristic which ready-made phantasies of this kind, touched upon by the dream-work, would be bound to possess, though this is a conclusion which the writers in question fail to draw. I do not assert, however, that *all* arousal dreams admit of this explanation, or that the problem of the accelerated passage of ideas in dreams can be entirely dismissed in this fashion.

At this point it is impossible to avoid considering the relation between this secondary revision of the content of dreams and the remaining factors of the dream-work. Are we to suppose that what happens is that in [499] the first instance the dream-constructing factors – the tendency towards condensation, the necessity for evading the censorship, and considerations of representability by the psychical means open to dreams – put together a provisional dream content out of the material provided, and that this content is subsequently [*nachträglich*] recast so as to conform so *Nachträglichkeit* far as possible to the demands of a second agency? This is scarcely probable. We must assume rather that from the very first the demands of this second factor constitute one of the conditions which the dream must satisfy and that this condition, like those laid down by condensation, the censorship imposed by resistance, and representability, operates simultaneously in a conducive and selective sense upon the mass of material present in the dream thoughts. In any case, however, of the four

conditions for the formation of dreams, the one we have come to know last is the one whose demands appear to have the least cogent influence on dreams.

The following consideration makes it highly probable that the psychical function which carries out what we have described as the secondary revision of the content of dreams is to be identified with the activity of our waking thought. Our waking (preconscious[1]) thinking behaves towards any perceptual material with which it meets in just the same way in which the function we are considering behaves towards the content of dreams. It is the nature of our waking thought to establish order in material of that kind, to set up relations in it and to make it conform to our expectations of an intelligible whole. [Cf. pp. 26 and 41 f. above.] In fact, we go too far in that direction. An adept in sleight of hand can trick us by relying upon this intellectual habit of ours. In our efforts at making an intelligible pattern of the sense impressions that are offered to us, we often fall into the strangest errors or even falsify the truth about the material before us.

The evidences of this are too universally known for there to be any need to insist upon them further. In our reading we pass over misprints which destroy the sense, and have the illusion that what we are reading is correct. The editor of a popular French periodical is said to have made a bet that he would have the words 'in front' or 'behind' inserted by the [500] printer in every sentence of a long article without a single one of his readers noticing it. He won his bet. Many years ago I read in a newspaper a comic instance of a false connection. On one occasion during a sitting of the French Chamber a bomb thrown by an anarchist exploded in the Chamber itself and Dupuy subdued the consequent panic with the courageous words: '*La séance continue*.' The visitors in the gallery were asked to give their impressions as witnesses to the outrage. Among them were two men from the provinces. One of these said that it was true that he had heard a detonation at the close of one of the speeches but he had assumed that it was a parliamentary usage to fire a shot each time a speaker sat down. The second one, who had probably already heard *several* speeches, had come to the same conclusion, except that he supposed that a shot was only fired as a tribute to a particularly successful speech.

1 [Freud's first published use of the term seems to occur on p. 301 above; it is explained below on p. 483. It appears as early as December 6, 1896, in his correspondence with Fliess (Freud, 1950*a*, Letter 52).]

There is no doubt, then, that it is our normal thinking that is the psychical agency which approaches the content of dreams with a demand that it must be intelligible, which subjects it to a first interpretation and which consequently produces a complete misunderstanding of it. [See p. 438 f. above.] For the purposes of *our* interpretation it remains an essential rule invariably to leave out of account the ostensible continuity of a dream as being of suspect origin, and to follow the same path back to the material of the dream thoughts, no matter whether the dream itself is clear or confused.

We now perceive, incidentally, on what it is that the range in the quality of dreams between confusion and clarity which was discussed on p. 294 f. depends. Those parts of a dream on which the secondary revision has been able to produce some effect are clear, while those parts on which its efforts have failed are confused. Since the confused parts of a dream are so often at the same time the less vivid parts, we may conclude that the secondary dream-work is also to be held responsible for a contribution to the plastic intensity of the different dream elements.

If I look around for something with which to compare the final form assumed by a dream as it appears after normal thought has made its contribution, I can think of nothing better than the enigmatic inscriptions with which *Fliegende Blätter* has for so long entertained its readers. They are intended to make the reader believe that a certain sentence – for
[501] the sake of contrast, a sentence in dialect and as scurrilous as possible – is a Latin inscription. For this purpose the letters contained in the words are torn out of their combination into syllables and arranged in a new order. Here and there a genuine Latin word appears; at other points we seem to see abbreviations of Latin words before us; and at still other points in the inscription we may allow ourselves to be deceived into overlooking the senselessness of isolated letters by parts of the inscription seeming to be defaced or showing lacunae. If we are to avoid being taken in by the joke, we must disregard everything that makes it seem like an inscription, look firmly at the letters, pay no attention to their ostensible arrangement, and so combine them into words belonging to our own mother tongue.[1]

1 [An instance of the operation of the process of secondary revision in the case of a fairy tale is given on p. 216 above and in the case of *Oedipus Rex* on p. 234. Its application to obsessions and phobias is mentioned on p. 216 above, and to paranoia in Lecture XXIV of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 336. An example of secondary revision in a telegraphic error is recorded in Chapter VI (No. 19) of *The Psychopathology of Everyday Life* (1901*b*), ibid., **6**, 112 f. The analogy between the secondary revision of dreams and the formation of 'systems' of thought is discussed at some length in Chapter III, Section 4, of *Totem and Taboo* (1912–13*a*), ibid., **13**, 92–3.]

Secondary revision[1] is the one factor in the dream-work which has been observed by the majority of writers on the subject and of which the significance has been appreciated. Havelock Ellis (1911*a*, 10–11) has given an amusing account of its functioning: 'Sleeping consciousness we may even imagine as saying to itself in effect: "Here comes our master, Waking Consciousness, who attaches such mighty importance to reason and logic and so forth. Quick! gather things up, put them in order – any order will do – before he enters to take possession."'

The identity of its method of working with that of waking thought has been stated with particular clarity by Delacroix (1904, 926): 'Cette fonction d'interprétation n'est pas particulière au rêve; c'est le même travail de coordination logique que nous faisons sur nos sensations pendant la veille.'[2] James Sully [1893, 355–6] is of the same opinion. So, too, is [502]
Tobowolska (1900, 93): 'Sur ces successions incohérentes d'hallucinations, l'esprit s'efforce de faire le même travail de coordination logique qu'il fait pendant la veille sur les sensations. Il relie entre elles par un lien imaginaire toutes ces images décousues et bouche les écarts trop grands qui se trouvaient entre elles.'[3]

According to some writers, this process of arranging and interpreting begins during the dream itself and is continued after waking. Thus Paulhan (1894, 546): 'Cependant j'ai souvent pensé qui'il pouvait y avoir une certaine déformation, ou plutôt reformation, du rêve dans le souvenir. . . . La tendance systématisante de l'imagination pourrait fort bien achever après le réveil ce qu'elle a ébauché pendant le sommeil. De la sorte, la rapidité réelle de la pensée serait augmentée en apparence par les perfectionnements dus à l'imagination éveillée.'[4] Bernard-Leroy & Tobowolska (1901, 592): 'Dans le rêve, au contraire, l'interprétation et la coordination se font non seulement à l'aide des données du rêve, mais encore à l'aide de celles de la veille. . . .'[5]

1 [The remainder of this chapter, with the exception of the last paragraph, which was in the original edition, was added in 1914.]

2 ['This interpretative function is not peculiar to dreams. It is the same work of logical coordination which we carry out upon our sensations while we are awake.']

3 ['The mind endeavours to carry out upon these incoherent trains of hallucinations the same work of logical coordination that it carries out upon sensations during the daytime. It connects up all these detached images by an imaginary link and stops up any excessively wide gaps between them.']

4 ['I have often thought, however, that dreams may be to some extent misshaped, or rather reshaped, in memory. . . . The tendency of the imagination towards systematization might very well complete after waking what it had started upon in sleep. In that way the real speed of thought would be given an apparent increase by the improvements due to the waking imagination.']

5 ['In a dream, on the contrary, interpretation and coordination are carried out by the help not only of the data presented in the dream, but of the data available in waking life. . . .']

Inevitably, therefore, this one recognized factor in the formation of dreams has had its importance overestimated, so that it has been credited with the whole achievement of the creation of dreams. This act of creation, as Goblot (1896, 288 f.) and still more Foucault (1906) suppose, is performed at the moment of waking; for these two writers attribute to waking thought an ability to construct a dream out of the thoughts that emerge during sleep. Bernard-Leroy & Tobowolska (1901) comment on this view: 'On a cru pouvoir placer le rêve au moment du réveil, et ils ont
[503] attribué à la pensée de la veille la fonction de construire le rêve avec les images présentes dans la pensée du sommeil.'[1]

From this discussion of secondary revision I will go on to consider a further factor in the dream-work which has recently been brought to light by some finely perceptive observations carried out by Herbert Silberer. As I have mentioned earlier (p. 308 f.), Silberer has, as it were, caught in the very act the process of transforming thoughts into images, by forcing himself into intellectual activity while he was in a state of fatigue and drowsiness. At such moments the thought with which he was dealing vanished and was replaced by a vision which turned out to be a substitute for what were as a rule abstract thoughts. (Cf. the examples in the passage just referred to.) Now it happened during these experiments that the image which arose, and which might be compared to an element of a dream, sometimes represented something other than the thought that was being dealt with – namely, the fatigue itself, the difficulty and unpleasure involved in the work. It represented, that is to say, the subjective state and mode of functioning of the person making the effort instead of the object of his efforts. Silberer described occurrences of this kind, which were very frequent in his case, as a 'functional phenomenon' in contrast to the 'material phenomenon' which would have been expected.

For instance: 'One afternoon I was lying on my sofa feeling extremely sleepy; nevertheless I forced myself to think over a philosophical problem. I wanted to compare the views of Kant and Schopenhauer upon time. As a result of my drowsiness I was unable to keep the arguments of both of them before my mind at once, which was necessary in order to make the comparison. After a number of vain attempts, I once more impressed Kant's deductions upon my mind with all the strength of my will, so that I might apply them to Schopenhauer's statement of the

1 ['It has been thought possible to locate dreams at the moment of waking, and [these authors] have ascribed to waking thought the function of constructing dreams out of the images present in sleeping thought.']

problem. I then directed my attention to the latter; but when I tried to turn back again to Kant, I found that his argument had once more escaped me and I tried vainly to pick it up once more. This vain effort at recovering the Kant dossier which was stored away somewhere in my head was [504] suddenly represented before my closed eyes as a concrete and plastic symbol, as though it were a dream picture: *I was asking for information from a disobliging secretary who was bent over his writing table and refused to put himself out at my insistent demand. He half-straightened himself and gave me a disagreeable and uncomplying look*.' (Silberer, 1909, 513 f. [Freud's italics.])

Here are some other instances, which relate to the oscillation between sleeping and waking:

'Example No. 2. – Circumstances: In the morning, at waking. While I was at a certain depth of sleep (a twilight state) and reflecting over a previous dream and in a sort of way continuing to dream it, I felt myself approaching nearer to waking consciousness but wanted to remain in the twilight state.

'Scene: *I was stepping across a brook with one foot but drew it back again at once with the intention of remaining on this side*.' (Silberer, 1912, 625.)

'Example No. 6. – Conditions as in example No. 4' (in which he had wanted to lie in bed a little longer, though without oversleeping). 'I wanted to give way to sleep for a little longer.

'Scene: *I was saying goodbye to someone and was arranging with him (or her) to meet him (or her) again soon*.' (Ibid., 627.)

The 'functional' phenomenon, 'the representation of a state instead of an object', was observed by Silberer principally in the two conditions of falling asleep and waking up. It is obvious that dream interpretation is only concerned with the latter case. Silberer has given examples which show convincingly that in many dreams the last pieces of the manifest content, which are immediately followed by waking, represent nothing more nor less than an intention to wake or the process of waking. The representation may be in terms of such images as crossing a threshold ('threshold symbolism'), leaving one room and entering another, departure, homecoming, parting with a companion, diving into water, etc. I cannot, however, refrain from remarking that I have come across dream elements which can be related to threshold symbolism, whether in my own dreams or in those of subjects whom I have analysed, far less frequently than Silberer's communications would have led one to expect.

[505] It is by no means inconceivable or improbable that this threshold symbolism might throw light upon some elements in the middle of the texture of dreams – in places, for instance, where there is a question of oscillations in the depth of sleep and of an inclination to break off the dream. Convincing instances of this, however, have not been produced.[1] What seem to occur more frequently are cases of overdetermination, in which a part of a dream which has derived its material content from the nexus of dream thoughts is employed to represent *in addition* some state of mental activity.

This very interesting functional phenomenon of Silberer's has, through no fault of its discoverer's, led to many abuses; for it has been regarded as lending support to the old inclination to give abstract and symbolic interpretations to dreams. The preference for the 'functional category' is carried so far by some people that they speak of the functional phenomenon wherever intellectual activities or emotional processes occur in the dream thoughts, although such material has neither more nor less right than any other kind to find its way into a dream as residues of the previous day. [Cf. pp. 190 *n.* 3 and 369 *n.* 1 above.]

We are ready to recognize the fact that Silberer's phenomena constitute a second contribution on the part of waking thought to the construction of dreams; though it is less regularly present and less significant than the first one, which has already been introduced under the name of 'secondary revision'. It has been shown that a part of the attention which operates during the day continues to be directed towards dreams during the state of sleep, that it keeps a check on them and criticizes them and reserves the power to interrupt them. It has seemed plausible to recognize in the mental agency which thus remains awake the censor[2] to whom we have had to attribute such a powerful restricting influence upon the form taken by dreams. What Silberer's observations have added to this is the fact that in certain circumstances a species of self-observation plays a part in this and makes a contribution to the content of the dream. The probable relations of this
[506] self-observing agency, which may be particularly prominent in philosophical minds, to endopsychic perception, to delusions of observation,

1 [See, however, a subsequent remark by Freud on p. 500 below.]

2 [Freud almost always uses the German word '*Zensur*' ('censorship'); but here and a few lines lower down he uses the personal form '*Zensor*' ('censor'). Other instances of this very rare occurrence can be found in Section III of the paper on 'Narcissism' (Freud, 1914*c*), *RSE*, **14**, 85, and in Lecture XXIX of the *New Introductory Lectures* (Freud, 1933*a*), ibid., **22**, 14.]

to conscience and to the censor of dreams can be more appropriately treated elsewhere.[1]

I will now try to sum up this lengthy disquisition on the dream-work. We were faced with the question whether the mind employs the whole of its faculties without reserve in constructing dreams or only a functionally restricted fragment of them. Our investigations led us to reject entirely the form in which the question was framed as being inadequate to the circumstances. If, however, we had to reply to the question on the basis of the terms in which it was stated, we should be obliged to reply in the affirmative to *both* the alternatives, mutually exclusive though they appear to be. Two separate functions may be distinguished in mental activity during the construction of a dream: the production of the dream thoughts, and their transformation into the content of the dream. The dream thoughts are entirely rational and are constructed with an expenditure of all the psychical energy of which we are capable. They have their place among thought processes that have not become conscious – processes from which, after some modification, our conscious thoughts, too, arise. However many interesting and puzzling questions the dream thoughts may involve, such questions have, after all, no special relation to dreams and do not call for treatment among the problems of dreams.[2] On the other hand, the second function of mental activity during dream construction, the transformation of the unconscious thoughts into the content of the dream, is peculiar to dream life and characteristic of it. This dream-work proper diverges further from our picture of waking thought than has been supposed even by the most determined depreciator of psychical functioning during the formation of dreams. [507]

1 [*Footnote added* 1914:] 'On Narcissism' (Freud, 1914*c* [*RSE*, **14**, 83–4]). – [The next paragraph appeared in the first edition.]

2 [*Footnote added* 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream thoughts and the dream-work. At bottom, dreams are nothing other than a particular *form* of thinking, made possible by the conditions of the state of sleep. It is the *dream-work* which creates that form, and it alone is the essence of dreaming – the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. [See below, p. 518 *n.* 1.] The fact that dreams concern themselves with attempts at solving the problems with which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious – and this we already knew.

The dream-work is not simply more careless, more irrational, more forgetful and more incomplete than waking thought; it is completely different from it qualitatively and for that reason not immediately comparable with it. It does not think, calculate or judge in any way at all; it restricts itself to giving things a new form. It is exhaustively described by an enumeration of the conditions which it has to satisfy in producing its result. That product, the dream, has above all to evade the censorship, and with that end in view the dream-work makes use of a *displacement of psychical intensities* to the point of a transvaluation of all psychical values. The thoughts have to be reproduced exclusively or predominantly in the material of visual and acoustic memory traces, and this necessity imposes upon the dream-work *considerations of representability* which it meets by carrying out fresh displacements. Greater intensities have probably to be produced than are available in the dream thoughts at night, and this purpose is served by the extensive *condensation* which is carried out with the constituents of the dream thoughts. Little attention is paid to the logical relations between the thoughts; those relations are ultimately given a disguised representation in certain *formal* characteristics of dreams. Any affect attached to the dream thoughts undergoes less modification than their ideational content. Such affects are as a rule suppressed; when they are retained, they are detached from the ideas that properly belong to them, affects of a similar character being brought together. Only a single portion of the dream-work and one which operates to an irregular degree, the working over of the material by
[508] partly aroused waking thought, tallies to some extent with the view which other writers have sought to apply to the entire activity of dream construction.[1]

1 [At this point there followed in the fourth, fifth, sixth and seventh editions (from 1914 to 1922) two self-contained essays by Otto Rank, bearing the titles 'Dreams and Creative Writing' and 'Dreams and Myths'. These were omitted from the *Gesammelte Schriften*, 1925, with a comment by Freud (**3**, 150) that they were 'naturally not included in a collected edition of my works'. They were, however, not reinserted in the subsequent (eighth) edition of 1930. See the Editors' Introduction, p. xxiv above.]

VII

THE PSYCHOLOGY OF THE DREAM PROCESSES[1]

Among the dreams which have been reported to me by other people, there is one which has special claims upon our attention at this point. It was told to me by a woman patient who had herself heard it in a lecture on dreams: its actual source is still unknown to me. Its content made an impression on the lady, however, and she proceeded to 'redream' it, that is, to repeat some of its elements in a dream of her own, so that, by taking it over [*Übertragung*] in this way, she might express her agreement with it on one particular point. [509]

The preliminaries to this model dream were as follows. A father had been watching beside his child's sick-bed for days and nights on end. After the child had died, he went into the next room to lie down, but left the door open so that he could see from his bedroom into the room in which his child's body was laid out, with tall candles standing round it. An old man had been engaged to keep watch over it, and sat beside the body murmuring prayers. After a few hours' sleep, the father had a dream that *his child was standing beside his bed, caught him by the arm and whispered to him reproachfully: 'Father, don't you see I'm burning?'* He woke up, noticed a bright glare of light from the next room, hurried into it and found that the old watchman had dropped off to sleep and that the wrappings and one of the arms of his beloved child's dead body had been burnt by a lighted candle that had fallen on them.

The explanation of this moving dream is simple enough and, so my patient told me, was correctly given by the lecturer. The glare of light shone through the open door into the sleeping man's eyes and led him to the conclusion which he would have arrived at if he had been awake, namely that a candle had fallen over and set something alight in the neighbourhood of the body. It is even possible that he had felt some [510]

1 [Some light is thrown on the difficulties presented in the later sections of this chapter by Freud's early correspondence with Wilhelm Fliess (Freud, 1950*a*). Cf. the Editors' Introduction (p. xviii ff. above).]

concern when he went to sleep as to whether the old man might not be incompetent to carry out his task.

Nor have I any changes to suggest in this interpretation except to add that the content of the dream must have been overdetermined and that the words spoken by the child must have been made up of words which he had actually spoken in his lifetime and which were connected with important events in the father's mind. For instance, '*I'm burning*' may have been spoken during the fever of the child's last illness, and '*Father, don't you see?*' may have been derived from some other highly emotional situation of which we are in ignorance.

But, having recognized that the dream was a process with a meaning, and that it can be inserted into the chain of the dreamer's psychical experiences, we may still wonder why it was that a dream occurred at all in such circumstances, when the most rapid possible awakening was called for. And here we shall observe that this dream, too, contained the fulfilment of a wish. The dead child behaved in the dream like a living one: he himself warned his father, came to his bed, and caught him by the arm, just as he had probably done on the occasion from the memory of which the first part of the child's words in the dream were derived. For the sake of the fulfilment of this wish the father prolonged his sleep by one moment. The dream was preferred to a waking reflection because it was able to show the child as once more alive. If the father had woken up first and then made the inference that led him to go into the next room, he would, as it were, have shortened his child's life by that moment of time.

There can be no doubt what the peculiar feature is which attracts our interest to this brief dream. Hitherto we have been principally concerned with the secret meaning of dreams and the method of discovering it and with the means employed by the dream-work for concealing it. The problems of dream interpretation have hitherto occupied the centre of the picture. And now we come upon a dream which raises no problem of interpretation and the meaning of which is obvious, but which, as we see, nevertheless retains the essential characteristics that differentiate dreams so strikingly from waking life and consequently call for explanation. It is only after we have disposed of everything that has to do with the work of
[511] interpretation that we can begin to realize the incompleteness of our psychology of dreams.

But before starting off along this new path, it will be well to pause and look around, to see whether in the course of our journey up to this point we have overlooked anything of importance. For it must be clearly

understood that the easy and agreeable portion of our journey lies behind us. Hitherto, unless I am greatly mistaken, all the paths along which we have travelled have led us towards the light – towards elucidation and fuller understanding. But as soon as we endeavour to penetrate more deeply into the mental process involved in dreaming, every path will end in darkness. There is no possibility of *explaining* dreams as a psychical process, since to explain a thing means to trace it back to something already known, and there is at the present time no established psychological knowledge under which we could subsume what the psychological examination of dreams enables us to infer as a basis for their explanation. On the contrary, we shall be obliged to set up a number of fresh hypotheses which touch tentatively upon the structure of the apparatus of the mind and upon the play of forces operating in it. We must be careful, however, not to pursue these hypotheses too far beyond their first logical links, or their value will be lost in uncertainties. Even if we make no false inferences and take all the logical possibilities into account, the probable incompleteness of our premises threatens to bring our calculation to a complete miscarriage. No conclusions upon the construction and working methods of the mental instrument can be arrived at or at least fully proved from even the most painstaking investigation of dreams or of any other mental function taken *in isolation*. To achieve this result, it will be necessary to correlate all the established implications derived from a comparative study of a whole series of such functions. Thus the psychological hypotheses to which we are led by an analysis of the processes of dreaming must be left, as it were, in suspense, until they can be related to the findings of other enquiries which seek to approach the kernel of the same problem from another angle.

(A)
THE FORGETTING OF DREAMS

[512] I suggest, therefore, that we should first turn to a topic that raises a difficulty which we have not hitherto considered but which is nevertheless capable of cutting the ground from under all our efforts at interpreting dreams. It has been objected on more than one occasion that we have in fact no knowledge of the dreams that we set out to interpret, or, speaking more correctly, that we have no guarantee that we know them as they actually occurred. (See p. 41 f. above.)

In the first place, what we remember of a dream and what we exercise our interpretative arts upon has been mutilated by the untrustworthiness of our memory, which seems quite especially incapable of retaining a dream and may well have lost precisely the most important parts of its content. It quite frequently happens that when we seek to turn our attention to one of our dreams we find ourselves regretting the fact that, though we dreamt far more, we can remember nothing but a single fragment which is itself recollected with peculiar uncertainty.

Secondly, there is every reason to suspect that our memory of dreams is not only fragmentary but positively inaccurate and falsified. On the one hand, it may be doubted whether what we dreamt was really as disconnected and hazy as our recollection of it; and, on the other hand, it may also be doubted whether a dream was really as connected as it is in the account we give of it, whether in attempting to reproduce it we do not fill in what was never there, or what has been forgotten, with new and arbitrarily selected material, whether we do not add embellishments and trimmings and round it off so that there is no possibility of deciding what its original content may have been. Indeed, one author, Spitta (1882, [338]),[1] goes to the point of suggesting that insofar as a dream shows any kind of order or coherence, these qualities are introduced into it only when we try to recall it to mind. [Cf. p. 42 above.] Thus there seems to be
[513] a danger that the very thing whose value we have undertaken to assess may slip completely through our fingers.

Hitherto in interpreting dreams we have disregarded such warnings. On the contrary, we have accepted it as being just as important to interpret the smallest, least conspicuous and most uncertain constituents of the

1 [*Added in text in* 1914 *and transferred to footnote in* 1930:] So too Foucault [1906, 141 f.] and Tannery [1898].

content of dreams as those that are most clearly and certainly preserved. The dream of Irma's injection contained the phrase 'I *at once* called in Dr M.' [p. 99 above]; and we assumed that even this detail would not have found its way into the dream unless it had had some particular origin. It was thus that we came upon the story of the unfortunate patient to whose bedside I had 'at once' called in my senior colleague. In the apparently absurd dream which treated the difference between 51 and 56 as a negligible quantity, the number 51 was mentioned several times. [See p. 389.] Instead of regarding this as a matter of course or as something indifferent, we inferred from it that there was a *second* line of thought in the latent content of the dream leading to the number 51; and along this track we arrived at my fears of 51 years being the limit of my life, in glaring contrast to the dream's dominant train of thought which was lavish in its boasts of a long life. In the '*Non vixit*' dream [p. 376 ff.] there was an inconspicuous interpolation which I overlooked at first: '*As P. failed to understand him, Fl. asked me*', etc. When the interpretation was held up, I went back to these words and it was they that led me on to the childhood phantasy which turned out to be an intermediate nodal point in the dream thoughts. [See p. 431 f.] This was arrived at by way of the lines:

> Selten habt ihr mich *verstanden*,
> Selten auch verstand ich Euch,
> Nur wenn wir im *Kot* uns fander
> So verstanden wir uns gleich.[1]

Examples could be found in every analysis to show that precisely the most trivial elements of a dream are indispensable to its interpretation and that the work in hand is held up if attention is not paid to these elements until too late. We have attached no less importance in interpreting [514]
dreams to every shade of the form of words in which they were laid before us. And even when it happened that the text of the dream as we had it was meaningless or inadequate – as though the effort to give a correct account of it had been unsuccessful – we have taken this defect into account as well. In short, we have treated as Holy Writ what previous writers have regarded as an arbitrary improvisation, hurriedly patched together in the embarrassment of the moment. This contradiction stands in need of an explanation.

1 [Literally 'Rarely have you *understood* me, and rarely too have I understood you. Not until we both found ourselves in the *shit* did we promptly understand each other.' Heine, *Buch der Lieder*, 'Die Heimkehr', LXXVIII.]

The explanation is in our favour, though without putting the other writers in the wrong. In the light of our newly won understanding of the origin of dreams the contradiction disappears completely. It is true that we distort dreams in attempting to reproduce them; here we find at work once more the process which we have described as the secondary (and often ill-conceived) revision of the dream by the agency which carries out normal thinking [p. 437 ff. above]. But this distortion is itself no more than a part of the revision to which the dream thoughts are regularly subjected as a result of the dream censorship. The other writers have at this point noticed or suspected the part of dream distortion which operates manifestly; *we* are less interested, since we know that a much more far-reaching process of distortion, though a less obvious one, has already developed the dream out of the hidden dream thoughts. The only mistake made by previous writers has been in supposing that the modification of the dream in the course of being remembered and put into words is an *arbitrary* one and cannot be further resolved and that it is therefore calculated to give us a misleading picture of the dream.[1] They have underestimated the extent to which psychical events are determined. There is nothing arbitrary about them. It can be shown quite generally that if an element is left undetermined by one train of thought, its determination is immediately effected by a second one. For instance, I may try to think of a number arbitrarily. But this is impossible: the number that occurs to me will be unambiguously and
[515] necessarily determined by thoughts of mine, though they may be remote from my immediate intention.[2] The modifications to which dreams are submitted under the editorship of waking life are just as little arbitrary. They are associatively linked to the material which they replace, and serve to show us the way to that material, which may in its turn be a substitute for something else.

In analysing the dreams of my patients I sometimes put this assertion to the following test, which has never failed me. If the first account given me by a patient of a dream is too hard to follow I ask him to repeat it. In doing so he rarely uses the same words. But the parts of the dream which he describes in different terms are by that fact revealed to me as the weak

1 [A misunderstanding in a contrary direction of the importance of the text of dreams is discussed in Freud's paper on 'The Handling of Dream Interpretation in Psychoanalysis' (1911*e*), *RSE*, **12**, 87.]

2 [*Footnote added* 1909:] See my *Psychopathology of Everyday Life* [1901*b*, Chapter XII (A), Nos. 2 to 7. – No. 2 relates to a letter written by Freud to Fliess on August 27, 1899 (Freud, 1950*a*, Letter 116), while he was correcting the proofs of the present volume, in which he prophesied that the book would contain 2,467 misprints. (See below, p. 475 *n*.)]

spot in the dream's disguise: they serve my purpose just as Hagen's was served by the embroidered mark on Siegfried's cloak.[1] That is the point at which the interpretation of the dream can be started. My request to the patient to repeat his account of the dream has warned him that I was proposing to take special pains in solving it; under pressure of the resistance, therefore, he hastily covers the weak spots in the dream's disguise by replacing any expressions that threaten to betray its meaning by other less revealing ones. In this way he draws my attention to the expression which he has dropped out. The trouble taken by the dreamer in preventing the solution of the dream gives me a basis for estimating the care with which its cloak has been woven.

Previous writers have had less justification in devoting so much space to the *doubt* with which our judgement receives accounts of dreams. For this doubt has no intellectual warrant. There is in general no guarantee of the correctness of our memory; and yet we yield to the compulsion to attach belief to its data far more often than is objectively justified. Doubt whether a dream or certain of its details have been correctly reported is [516]
once more a derivative of the dream censorship, of resistance to the penetration of the dream thoughts into consciousness.[2] This resistance has not been exhausted even by the displacements and substitutions it has brought about; it persists in the form of doubt attaching to the material which has been allowed through. We are especially inclined to misunderstand this doubt since it is careful never to attack the more intense elements of a dream but only the weak and indistinct ones. As we already know, however, a complete transvaluation of all psychical values takes place between the dream thoughts and the dream [p. 293 f. above]. Distortion is only made possible by a withdrawal of psychical value; it habitually expresses itself by that means and is occasionally content to require nothing more. If, then, an indistinct element of a dream's content is in addition attacked by doubt, we have a sure indication that we are dealing with a comparatively direct derivative of one of the proscribed dream thoughts. The state of things is what it was after some sweeping revolution in one of the republics of antiquity or the Renaissance. The noble and powerful families which had previously dominated the scene

1 [There was only one spot on Siegfried's body where he could be wounded. By a trick, Hagen persuaded Kriemhild, who alone knew where the spot was, to embroider a small cross on Siegfried's cloak at the vital point. It was there that Hagen later stabbed him. (*Nibelungenlied*, XV and XVI.)]

2 [For the same mechanism of doubt in cases of hysteria, see the case history of 'Dora' (1905*e*), *RSE*, 7, 17 and *n*. 2.]

were sent into exile and all the high offices were filled by newcomers. Only the most impoverished and powerless members of the vanquished families, or their remote dependants, were allowed to remain in the city; and even so they did not enjoy full civic rights and were viewed with distrust. The distrust in this analogy corresponds to the doubt in the case we are considering. That is why in analysing a dream I insist that the whole scale of estimates of certainty shall be abandoned and that the faintest possibility that something of this or that sort may have occurred in the dream shall be treated as complete certainty. In tracing any element of a dream it will be found that unless this attitude is firmly adopted the analysis will come to a standstill. If any doubt is thrown upon the value of the element in question, the psychical result in the patient is that none of the involuntary ideas underlying that element comes into his head. This result is not a self-evident one. It would not be nonsense if someone were to say: 'I don't know for certain whether such and such a thing came into the dream, but here is what occurs to me in connection
[517] with it.' But in fact no-one ever does say this; and it is precisely the fact that doubt produces this interrupting effect upon an analysis that reveals it as a derivative and tool of psychical resistance. Psychoanalysis is justly suspicious. One of its rules is that *whatever interrupts the progress of analytic work is a resistance*.[1]

The *forgetting* of dreams, too, remains inexplicable unless the power of the psychical censorship is taken into account. In a number of cases the feeling of having dreamt a great deal during the night and of only having retained a little of it may in fact have some other meaning, such as that the dream-work has been perceptibly proceeding all through the night but has only left a short dream behind. [Cf. pp. 248 f. and 438 above, and 515 below.] It is no doubt true that we forget dreams more and more as time passes after waking; we often forget them in spite of the most painstaking efforts to recall them. But I am of the opinion that the extent of this forgetting is as a rule overestimated; and there is a similar overestimation of the extent to which the gaps in a dream limit our knowledge

1 [*Footnote added* 1925:] The proposition laid down in these peremptory terms – 'whatever interrupts the progress of analytic work is a resistance' – is easily open to misunderstanding. It is, of course, only to be taken as a technical rule, as a warning to analysts. It cannot be disputed that in the course of an analysis various events may occur the responsibility for which cannot be laid upon the patient's intentions. His father may die without his having murdered him; or a war may break out which brings the analysis to an end. But behind its obvious exaggeration the proposition is asserting something both true and new. Even if the interrupting event is a real one and independent of the patient, it often depends on him how great an interruption it causes; and resistance shows itself unmistakably in the readiness with which he accepts an occurrence of this kind or the exaggerated use which he makes of it.

of it. It is often possible by means of analysis to restore all that has been lost by the forgetting of the dream's content; at least, in quite a number of cases one can reconstruct from a single remaining fragment not, it is true, the dream – which is in any case a matter of no importance – but all the dream thoughts. This demands a certain amount of attention and self-discipline in carrying out the analysis; that is all – but it shows that there was no lack of a hostile [i.e. resistant] purpose at work in the forgetting of the dream.[1]

Convincing evidence of the fact that the forgetting of dreams is ten- [518]
dentious and serves the purpose of resistance[2] is afforded when it is possible to observe in analyses a preliminary stage of forgetting. It not infrequently happens that in the middle of the work of interpretation an omitted portion of the dream comes to light and is described as having been forgotten till that moment. Now a part of a dream that has been rescued from oblivion in this way is invariably the most important part; it always lies on the shortest road to the dream's solution and has for that reason been exposed to resistance more than any other part. Among the [519]
specimen dreams scattered through this volume, there is one in which a

1 [*Footnote added* 1919:] I may quote the following dream from my *Introductory Lectures* [Freud, 1916–17*a*, Lecture VII; *RSE*, **15**, 104] as an example of the meaning of doubt and uncertainty in a dream and of its content being at the same time shrunk down to a single element; in spite of this the dream was successfully analysed after a short delay:

'A sceptical woman patient had a longish dream in the course of which some people told her about my book on jokes and praised it highly. Something came in then about *a "channel", perhaps it was another book that mentioned a channel, or something else about a channel . . . she didn't know . . . it was all so indistinct*.

'No doubt you will be inclined to expect that the element "channel", since it was so indistinct, would be inaccessible to interpretation. You are right in suspecting a difficulty; but the difficulty did not arise from the indistinctness: both the difficulty and the indistinctness arose from another cause. Nothing occurred to the dreamer in connection with "channel", and *I* could of course throw no light on it. A little later – it was the next day, in point of fact – she told me that she had thought of something that *might* have something to do with it. It was a joke, too – a joke she had heard. On the steamer between Dover and Calais a well-known author fell into conversation with an Englishman. The latter had occasion to quote the phrase: "Du sublime au ridicule il n'y a qu'un pas. [It is only a step from the sublime to the ridiculous.]" Yes, replied the author, "*le Pas de Calais*" – meaning that he thought France sublime and England ridiculous. But the *Pas de Calais* is a channel – the English Channel [the Straits of Dover]. You will ask whether I think this had anything to do with the dream. Certainly I think so; and it provides the solution to the puzzling element of the dream. Can you doubt that this joke was already present before the dream occurred, as the unconscious thought behind the element "channel"? Can you suppose that it was introduced as a subsequent [*nachträglich*] invention? The association betrayed the scepticism which lay concealed behind the patient's ostensible admiration; and her resistance against revealing this was no doubt the common cause both of her delay in producing the association and of the indistinctness of the dream element concerned. Consider the relation of the dream element to its unconscious background: it was, as it were, a fragment of that background, an allusion to it, but it was made quite incomprehensible by being isolated.'

2 On the purposes of forgetting in general see my short paper on the psychical mechanism of forgetting (Freud, 1898*b*). [*Added* 1909:] Later included [with modifications] as the first chapter in my *Psychopathology of Everyday Life* (Freud, 1901*b*), *RSE*, **6**, 1 ff.

part of its content was added like this as an afterthought [*nachträglich*].[1] It is the travel dream in which I revenged myself on two disagreeable fellow travellers and which I had to leave almost uninterpreted on account of its gross indecency. [See p. 407 ff. above.] The omitted portion ran as follows: '*I said* [in English], *referring to one of Schiller's works: "It is from . . ." but, noticing the mistake, I corrected myself: "It is by . . ." "Yes," the man commented to his sister, "he said that right."*'[2]

Self-corrections in dreams, which seem so marvellous to some writers, need not occupy our attention. I will indicate instead the recollection which served as the model for my verbal error in this dream. When I was nineteen[3] years old I visited England for the first time and spent a whole day on the shore of the Irish Sea. I naturally revelled in the opportunity of collecting the marine animals left behind by the tide and I was occupied with a starfish – the words '*Hollthurn*' and '*holothurians* [sea slugs]' occurred at the beginning of the dream – when a charming little girl came up to me and said: 'Is it a starfish? Is it alive?' 'Yes,' I replied, 'he is alive', and at once, embarrassed at my mistake, repeated the sentence correctly. The dream replaced the verbal error which I then made with another into which a German is equally liable to fall. '*Das Buch ist von Schiller*' should be translated not with a 'from' but with a 'by'. After all that we have heard of the purposes of the dream-work and its reckless choice of methods for attaining them, we shall not be surprised to hear that it effected this replacement because of the magnificent piece of condensation that was made possible by the identity of sound of the English 'from' and the German adjective '*fromm*' ['pious']. But how did my blameless memory of the seashore come to be in the dream? It served as the most
[520] innocent possible example of my using a word indicating gender or sex in the wrong place – of my bringing in sex (the word 'he') where it did not belong. This, incidentally, was one of the keys to the solution to the dream. No-one who has heard, furthermore, the origin attributed to the title of Clerk Maxwell's '*Ma*tter and *Mo*tion' [mentioned in the dream, p. 407 above] will have any difficulty in filling in the gaps:

1 [Another instance can be found on p. 137 f. *n*. 3 above. Yet another occurs in the analysis of 'Dora's' second dream (Freud, 1905*e*, Section III), *RSE*, 7, 84 ff.]

2 [*Footnote added* 1914:] Corrections such as this in the usages of foreign languages are not infrequent in dreams but are more often attributed to other people. Maury (1878, 143) once dreamt, at a time when he was learning English, that, in telling someone that he had visited him the day before, he used the words 'I called for you yesterday'. Whereupon the other answered correctly: 'You should have said "I called *on* you yesterday".'

3 [In the first edition only (but not in the 1925 reprint of it), this read 'seventeen'. See Jones (1953), 35–6.]

*Mo*lière's 'Le *Ma*lade Imaginaire' – 'La *ma*tière est-elle laudable?'[1] – A *mo*tion of the bowels.

Moreover, I am in a position to offer an ocular demonstration of the fact that the forgetting of dreams is to a great extent a product of resistance. One of my patients will tell me he has had a dream but has forgotten every trace of it: it is therefore just as though it had never happened. We proceed with our work. I come up against a resistance; I therefore explain something to the patient and help him by encouragement and pressure to come to terms with some disagreeable thought. Hardly have I succeeded in this than he exclaims: 'Now I remember what it was I dreamt.' The same resistance which interfered with our work that day also made him forget the dream. By overcoming this resistance I have recalled the dream to his memory.

In just the same way, when a patient reaches some particular point in his work, he may be able to remember a dream which he had dreamt three or four or even more days before and which had hitherto remained forgotten.[2]

Psychoanalytic experience[3] has provided us with yet another proof that the forgetting of dreams depends far more upon resistance than upon the fact, stressed by the authorities, that the waking and sleeping states are alien to each other [p. 40 f. above]. It not infrequently happens to me, as well as to other analysts and to patients under treatment, that, having been woken up, as one might say, by a dream, I immediately afterwards, and in full possession of my intellectual powers, set about interpreting it. In such cases I have often refused to rest till I have arrived at a complete understanding of the dream; yet it has sometimes been my [521]
experience that after finally waking up in the morning I have entirely forgotten both my interpretative activity and the content of the dream, though knowing that I have had a dream and interpreted it.[4] It happens far more often that the dream draws the findings of my interpretative activity back with it into oblivion than that my intellectual activity

1 ['Is the matter laudable?', which is old medical terminology for 'Is the excretion healthy?' – The next phrase is in English in the original. – We are indebted to the editors of the *Oeuvres complètes de Freud* for noticing that Freud committed a double error here; the Molière play in question is in fact *Le Médecin Malgré Lui* (Act II, Scene 4), not *Le Malade Imaginaire*, and the quotation is 'La matière est-elle louable', not 'laudable'. The error was propagated in all the German and English editions but the meaning is unaffected.]

2 [*Footnote added* 1914:] Ernest Jones has described [1912*b*] an analogous case which often occurs: while a dream is being analysed the patient may recollect a second one which was dreamt during the same night but whose very existence had not been suspected.

3 [This paragraph and the next were added in 1911.]

4 [Cf. Postscript to the 'Analysis of a Phobia in a Five-Year-Old Boy' (Freud, 1922*c*), *RSE*, **10**, 113 ff.]

succeeds in preserving the dream in my memory. Yet there is no such psychical gulf between my interpretative activity and my waking thoughts as the authorities suppose to account for the forgetting of dreams.

Morton Prince (1910, [141]) has objected to my explanation of the forgetting of dreams on the ground that that forgetting is only a special case of the amnesia attaching to dissociated mental states, that it is impossible to extend my explanation of this special amnesia to other types and that my explanation is consequently devoid of value even for its immediate purpose. His readers are thus reminded that in the course of all his descriptions of these dissociated states he has never attempted to discover a dynamic explanation of such phenomena. If he had, he would inevitably have found that repression (or, more precisely, the resistance created by it) is the cause both of the dissociations and of the amnesia attaching to their psychical content.

An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When
[522] making these subsequent [*nachträglichen*] interpretations I have compared the dream thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them – by the same procedure and with the same success – as though they had dreamt them the night before. When I come to discuss anxiety dreams I shall give two examples of postponed interpretations like these. [See p. 521 ff. below.] I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I

treat a psychoneurotic – a hysteric, let us say – by psychoanalysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in *Studies on Hysteria* [Breuer & Freud, 1895*d*] of the first hysterical attack which a woman of over forty had had in her fifteenth year.[1] [This patient was Frau Cäcilie M., referred to in Case History 5; cf. *RSE*, **2**, 156 ff.]

And here I will mention a number of further, somewhat disconnected, points on the subject of interpreting dreams, which may perhaps help to give readers their bearings should they feel inclined to check my statements by subsequent work upon their own dreams.

No-one should expect that an interpretation of his dreams will fall into his lap like manna from the skies. Practice is needed even for perceiving endoptic phenomena or other sensations from which our attention is [523]
normally withheld; and this is so even though there is no psychical motive fighting against such perceptions. It is decidedly more difficult to get hold of 'involuntary ideas'. Anyone who seeks to do so must familiarize himself with the expectations raised in the present volume and must, in accordance with the rules laid down in it, endeavour during the work to refrain from any criticism, any *parti pris*, and any emotional or intellectual bias. He must bear in mind Claude Bernard's[2] advice to experimenters in a physiological laboratory: 'travailler comme une bête' – he must work, that is, with as much persistence as an animal and with as much disregard of the result. If this advice is followed, the task will no longer be a hard one.

The interpretation of a dream cannot always be accomplished at a single sitting. When we have followed a chain of associations, it not infrequently happens that we feel our capacity exhausted; nothing more is to be learnt from the dream that day. The wisest plan then is to break off and resume our work another day: another part of the dream's content may then attract our attention and give us access to another stratum

1 [*Added in the text in* 1919 *and transferred to a footnote in* 1930:] Dreams which occur in the earliest years of childhood and are retained in the memory for dozens of years, often with complete sensory vividness, are almost always of great importance in enabling us to understand the history of the subject's mental development and of his neurosis. Analysis of such dreams protects the physician from errors and uncertainties which may lead, among other things, to theoretical confusion. [The example of the 'Wolf Man's' dream was no doubt especially in Freud's mind (1918*b*), *RSE*, **17**, 26 ff.]

2 [The French physiologist (1813–78).]

of dream thoughts. This procedure might be described as 'fractional' dream interpretation.

It is only with the greatest difficulty that the beginner in the business of interpreting dreams can be persuaded that his task is not at an end when he has a complete interpretation in his hands – an interpretation which makes sense, is coherent and throws light upon every element of the dream's content. For the same dream may perhaps have another interpretation as well, an 'overinterpretation', which has escaped him. It is, indeed, not easy to form any conception of the abundance of the unconscious trains of thought, all striving to find expression, which are active in our minds. Nor is it easy to credit the skill shown by the dream-work in always hitting upon forms of expression that can bear several meanings – like the Little Tailor in the fairy tale who hit seven flies at a blow. My readers will always be inclined to accuse me of introducing an unnecessary amount of ingenuity into my interpretations; but actual experience would teach them better. [See p. 265 *n*. above.]

[524] On the other hand,[1] I cannot confirm the opinion, first stated by Silberer [e.g. 1914, Part II, Section 5], that all dreams (or many dreams, or certain classes of dreams) require two different interpretations, which are even stated to bear a fixed relation to each other. One of these interpretations, which Silberer calls the 'psychoanalytic' one, is said to give the dream some meaning or other, usually of an infantile-sexual kind; the other and more important interpretation, to which he gives the name of 'anagogic', is said to reveal the more serious thoughts, often of profound import, which the dream-work has taken as its material. Silberer has not given evidence in support of this opinion by reporting a series of dreams analysed in the two directions. And I must object that the alleged fact is non-existent. In spite of what he says, the majority of dreams require no 'overinterpretation' and, more particularly, are insusceptible to an anagogic interpretation. As in the case of many other theories put forward in recent years, it is impossible to overlook the fact that Silberer's views are influenced to some extent by a purpose which seeks to disguise the fundamental circumstances in which dreams are formed and to divert interest from their roots in the drives [*Triebwurzeln*]. In a certain number of cases I have been able to confirm Silberer's statements. Analysis showed that in such cases the dream-work found itself faced with the problem of transforming into a dream a series of highly abstract thoughts from waking life which were incapable of being given any direct representation. It endeavoured to solve

1 [This paragraph was added in 1919.]

the problem by getting hold of another group of intellectual material, somewhat loosely related (often in a manner which might be described as 'allegorical') to the abstract thoughts, and at the same time capable of being represented with fewer difficulties. The *abstract* interpretation of a dream that has arisen in this way is given by the dreamer without any difficulty; the *correct* interpretation of the material that has been interpolated must be looked for by the technical methods which are now familiar to us.[1]

The question whether it is possible to interpret *every* dream must be answered in the negative.[2] It must not be forgotten that in interpreting a [525]
dream we are opposed by the psychical forces which were responsible for its distortion. It is thus a question of relative strength whether our intellectual interest, our capacity for self-discipline, our psychological knowledge and our practice in interpreting dreams enable us to master our internal resistances. It is always possible to go *some* distance: far enough, at all events, to convince ourselves that the dream is a structure with a meaning, and as a rule far enough to get a glimpse of what that meaning is. Quite often an immediately succeeding dream allows us to confirm and carry further the interpretation we have tentatively adopted for its predecessor. A whole series of dreams, continuing over a period of weeks or months, is often based upon common ground and must accordingly be interpreted in connection with one another. [Cf. pp. 171 and 323 above.] In the case of two consecutive dreams it can often be observed that one takes as its central point something that is only on the periphery of the other and *vice versa*, so that their interpretations too are mutually complementary. I have already given instances which show that different dreams dreamt on the same night are, as a quite general rule, to be treated in their interpretation as a single whole. [See p. 297 f.]

There is often a passage in even the most thoroughly interpreted dream which has to be left obscure; this is because we become aware during the work of interpretation that at that point there is a tangle of dream thoughts which cannot be unravelled and which, moreover, adds nothing to our knowledge of the content of the dream. This is the dream's navel, the spot where it reaches down into the unknown[t]. [Cf. p. 99 *n*. 1.] The dream thoughts to which we are led by interpretation cannot, from the nature of things, have any definite endings; they are bound to branch out in every direction into the intricate network of our world of thought.

1 [Freud also discussed this point in a long footnote in his paper 'A Metapsychological Supplement to the Theory of Dreams' (1916–17*f* [1915]), *RSE*, **14**, 203 *n*. 1, and in his 'Dreams and Telepathy' (1922*a*), ibid., **18**, 206 f.]

2 [This question is considered at greater length in Freud (1925*i*), Section A; ibid., **19**, 115 f.]

It is at some point where this meshwork is particularly close that the dream wish grows up, like a mushroom out of its mycelium.

But we must return to the facts concerning the forgetting of dreams, for we have failed to draw one important conclusion from them. We have seen that waking life shows an unmistakable inclination to forget any dream that has been formed in the course of the night – whether as a whole directly after waking, or bit by bit in the course of the day; and we
[526] have recognized that the agent chiefly responsible for this forgetting is the mental resistance to the dream which has already done what it could against it during the night. But if all this is so, the question arises how it comes about that a dream can be formed at all in the face of this resistance. Let us take the most extreme case, in which waking life has got rid of a dream as though it had never occurred. A consideration of the interplay of psychical forces [*Kräfte*][T] in this case must lead us to infer that the dream would in fact not have occurred at all if the resistance had been as strong during the night as during the day. We must conclude that during the night the resistance loses some of its power [*Macht*], though we know it does not lose the whole of it, since we have shown the part it plays in the formation of dreams as a distorting agent. But we are driven to suppose that its power may be diminished at night and that this makes the formation of dreams possible. This makes it easy to understand how, having regained its full strength at the moment of waking, it at once proceeds to get rid of what it was obliged to permit while it was weak. Descriptive psychology tells us that the principal *sine qua non* for the formation of dreams is that the mind shall be in a state of sleep; and we are now able to explain this fact: *the state of sleep makes the formation of dreams possible because it reduces the power of the endopsychic censorship*.

It is no doubt tempting to regard this as the only possible inference that can be drawn from the facts of the forgetting of dreams, and to make it the basis for further conclusions as to the conditions of energy prevailing during sleeping and waking. For the moment, however, we will stop at this point. When we have entered a little more deeply into the psychology of dreams we shall find that the factors making possible the formation of dreams can be viewed in another way as well. It may be that the resistance against the dream thoughts becoming conscious can be evaded without any reduction having taken place in its power. And it seems a plausible idea that *both* of the two factors favouring the formation of dreams – the reduction and the evasion of

the resistance – are simultaneously made possible by the state of sleep. I will break off here, though I shall pick up the argument again presently. [Cf. p. 513 f. below.]

There is another set of objections to our method of interpreting dreams with which we must now deal. Our procedure consists in abandoning all [527] those purposive ideas which normally govern our reflections, in focusing our attention on a single element of the dream and in then taking note of whatever involuntary thoughts may occur to us in connection with it. We then take the next portion of the dream and repeat the process with *it*. We allow ourselves to be led on by our thoughts regardless of the direction in which they carry us and drift on in this way from one thing to another. But we cherish a confident belief that in the end, without any active intervention on our part, we shall arrive at the dream thoughts from which the dream originated.

Our critics argue against this along the following lines. There is nothing wonderful in the fact that a single element of the dream should lead us *somewhere*; every idea can be associated with *something*. What is remarkable is that such an aimless and arbitrary train of thought should happen to bring us to the dream thoughts. The probability is that we are deceiving ourselves. We follow a chain of associations from one element, till, for one reason or another, it seems to break off. If we then take up a second element, it is only to be expected that the originally unrestricted character of our associations will be narrowed. For we still have the earlier chain of thoughts in our memory, and for that reason, in analysing the second dream idea, we are more likely to hit upon associations which have something in common with associations from the first chain. We then delude ourselves into thinking that we have discovered a thought which is a connecting point between two elements of the dream. Since we give ourselves complete liberty to connect thoughts as we please and since in fact the only transitions from one idea to another which we exclude are those which operate in normal thinking, we shall find no difficulty in the long run in concocting out of a number of 'intermediate thoughts' something which we describe as the dream thoughts and which – though without any guarantee, since we have no other knowledge of what the dream thoughts are – we allege to be the psychical substitute for the dream. But the whole thing is completely arbitrary; we are merely exploiting chance connections in a manner which gives an effect of ingenuity. In this way anyone who cares to take such useless pains can worry out any interpretation he pleases from any dream.

[528] If we were, in fact, met with objections such as these, we might defend ourselves by appealing to the impression made by our interpretations, to the surprising connections with other elements of the dream which emerge in the course of our pursuing a single one of its ideas, and to the improbability that anything which gives such an exhaustive account of the dream could have been arrived at except by following up psychical connections which had already been laid down. We might also point out in our defence that our procedure in interpreting dreams is identical to the procedure by which we resolve hysterical symptoms; and there the correctness of our method is warranted by the coincident emergence and disappearance of the symptoms, or, to use a simile, the assertions made in the text are borne out by the accompanying illustrations. But we have no reason for evading the problem of how it is possible to reach a pre-existing goal by following the drift of an arbitrary and purposeless chain of thoughts; since, though we may not be able to solve the problem, we can completely cut the ground from under it.

For it is demonstrably untrue that we are being carried along a purposeless stream of ideas when, in the process of interpreting a dream, we abandon reflection and allow involuntary ideas to emerge. It can be shown that all that we can ever get rid of are purposive ideas that are *known* to us; as soon as we have done this, *unknown* – or, as we inaccurately say, 'unconscious' – purposive ideas take charge and thereafter determine the course of the involuntary ideas. No influence that we can bring to bear upon our mental processes can ever enable us to think without purposive ideas; nor am I aware of any states of psychical confu-
[529] sion which can do so.[1] Psychiatrists have been far too ready in this respect

1 [*Footnote added* 1914:] It was not until later that my attention was drawn to the fact that Eduard von Hartmann takes the same view on this important matter of psychology: 'In discussing the part played by the unconscious in artistic creation, Eduard von Hartmann (1869, **1**, Section B, Chapter V) made a clear statement of the law in accordance with which the association of ideas is governed by unconscious purposive ideas, though he was unaware of the scope of the law. He set out to prove that "every combination of sensuous presentations, when it is not left purely to chance, but is led to a definite end, requires the help of the Unconscious" [ibid., **1**, 245; English translation, 1884, **1**, 283], and that the part played by conscious interest is to stimulate the unconscious to select the most appropriate idea among the countless possible ones. It is the unconscious which makes the appropriate selection of a purpose for the interest and this "holds good of the association of ideas in abstract thinking as well as in sensuous imagining and artistic combination" and in the production of jokes [ibid., **1**, 247; English translation, **1**, 285 f.]. For this reason a limitation of the association of ideas to an exciting idea and an excited idea (in the sense of a pure association psychology) cannot be upheld. Such a limitation could be justified "only if there are conditions in human life in which man is free not only from every conscious purpose, but also from the sway or cooperation of every unconscious interest, every passing mood. This is, however, a condition hardly ever occurring, for even if one in appearance completely abandons his train of thought to accident, or if one abandons oneself entirely to the involuntary dreams of fancy, yet always other leading interests, dominant feelings and moods prevail at one time rather

to abandon their belief in the connectedness of psychical processes. I know for a fact that trains of thought without purposive ideas no more occur in hysteria and paranoia than they do in the formation or resolution of dreams. It may be that they do not occur in any of the endogenous psychical disorders. Even the deliria of confusional states may have a meaning, if we are to accept Leuret's brilliant suggestion [1834, 131] that they are only unintelligible to us owing to the gaps in them. I myself have formed the same opinion when I have had the opportunity of observing them. Deliria are the work of a censorship which no longer takes the trouble to conceal its operation; instead of collaborating in producing a new version that shall be unobjectionable, it ruthlessly deletes whatever it disapproves of, so that what remains becomes quite disconnected. This censorship acts exactly like the censorship of newspapers at the Russian frontier, which allows foreign journals to fall into the hands of the readers whom it is its business to protect only after a quantity of passages have been blacked out.

It may be that free play of ideas with a fortuitous chain of associations is to be found in destructive organic cerebral processes; what is regarded as such in the psychoneuroses can always be explained as an effect of the censorship's influence upon a train of thought which has been pushed into the foreground by purposive ideas [*Zielvorstellungen*] that have remained hidden.[1] It has been regarded as an unfailing sign of an association being uninfluenced by purposive ideas if the associations (or images) in question seem to be interrelated in what is described as a 'superficial' manner – by assonance, verbal ambiguity, temporal coincidence without connection in meaning, or by any association of the kind that we allow in jokes or in play upon words. This characteristic is present in the chains of thought which lead from the elements of a dream to the intermediate thoughts and from these to the dream thoughts proper; we have seen instances of this – not without astonishment – in many dream analyses. No connection was too loose, no joke too bad, to serve as a bridge from one thought to another. But the true [530]

than at another, and these will always exert an influence on the association of ideas." [Ibid., **1**, 246; English translation, **1**, 284.] "In semi-conscious dreams always only such ideas as correspond to the main [unconscious] interest of the moment occur." [Loc. cit.] The emphasis thus laid upon the influence of feelings and moods on the free sequence of thoughts makes it possible to justify the methodological procedure of psychoanalysis completely from the standpoint of Hartmann's psychology.' (Pohorilles, 1913.) – Du Prel (1885, 107) refers to the fact that after we have vainly tried to recall a name, it often comes into our heads again suddenly and without any warning. He then concludes from this that unconscious but nonetheless purposeful thinking has taken place and that its result has suddenly entered consciousness.

1 [*Footnote added* 1909:] This assertion has received striking confirmation from C. G. Jung's analyses in cases of dementia praecox. (Jung, 1907.)

explanation of this easy-going state of things is soon found. *Whenever one psychical element is linked with another by an objectionable or superficial association, there is also a legitimate and deeper link between them which is subjected to the resistance of the censorship*.[1]

The real reason for the prevalence of superficial associations is not the abandonment of purposive ideas but the pressure of the censorship. Superficial associations replace deep ones if the censorship makes the normal connecting paths impassable. We may picture, by way of analogy, a mountain region, where some general interruption of traffic (owing to floods, for instance) has blocked the main, major roads, but where communications are still maintained over inconvenient and steep footpaths normally used only by the hunter.

Two cases may here be distinguished, though in essence they are the same. In the first of these, the censorship is directed only against the *connection* between two thoughts, which are unobjectionable separately. If so, the two thoughts will enter consciousness in succession; the connection between them will remain concealed, but, instead, a superficial link [531] between them will occur to us, of which we should otherwise never have thought. This link is usually attached to some part of the complex of ideas quite other than that on which the suppressed and essential connection is based. The second case is where the two thoughts are in themselves subject to censorship on account of their content. If so, neither of them appears in its true shape but only in a modified one which replaces it; and the two replacing thoughts are chosen in such a way that they have a superficial association that repeats the essential connection which relates the two thoughts that have been replaced. *In both these cases the pressure of the censorship has resulted in a displacement from a normal and serious association to a superficial and apparently absurd one*.

Since we are aware that displacements of this kind occur, we have no hesitation when we are interpreting dreams in relying upon superficial associations as much as upon others.[2]

1 [Everywhere else in this work Freud speaks of 'the censorship of the resistance'. A later clarification of the relation between the concepts of 'resistance' and 'censorship' can be found in Lecture XXIX of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 14–15.]

2 The same considerations apply equally, of course, to cases in which the superficial associations appear openly in the content of the dream, as, for instance, in the two dreams of Maury's quoted above on page 52 f. (*Pélerinage – Pelletier – pelle; kilomètre – kilogramme – Gilolo – Lobelia – Lopez – lotto*.) My work with neurotic patients has taught me the nature of the memories of which this is a favourite method of representation. They are occasions on which the subject has turned over the pages of encyclopaedias or dictionaries in order (like most people at the inquisitive age of puberty) to satisfy their craving for an answer to the riddles of sex. – [An example of this can be found in the analysis of 'Dora's' second dream (Freud, 1905*e*, Section III), *RSE*, **7**, 89 f.]

In the psychoanalysis of neuroses the fullest use is made of these two theorems – that, when conscious purposive ideas are abandoned, concealed purposive ideas assume control of the current of ideas, and that superficial associations are only substitutes by displacement for suppressed deeper ones. Indeed, these theorems have become basic pillars of psychoanalytic technique. When I instruct a patient to abandon reflection of any kind and to tell me whatever comes into his head, I am relying firmly on the presumption that he will not be able to abandon the purposive ideas inherent in the treatment and I feel justified in inferring that what seem to be the most innocent and arbitrary things which he tells me are in fact related to his illness. There is another purposive idea of which the patient has no suspicion – one relating to myself. The full estimate of [532]
the importance of these two theorems, as well as more detailed information about them, fall within the province of an account of the technique of psychoanalysis. Here, then, we have reached one of the frontier posts at which, in accordance with our programme, we must drop the subject of dream interpretation.[1]

There is one true conclusion that we may glean from these objections, namely that we need not suppose that every association that occurs during the work of interpretation had a place in the dream-work during the night. [Cf. pp. 249 and 277 above.] It is true that in carrying out the interpretation in the waking state we follow a path which leads back from the elements of the dream to the dream thoughts and that the dream-work followed one in the contrary direction. But it is highly improbable that these paths are passable both ways. It appears, rather, that in the daytime we drive shafts which follow along fresh chains of thought and that these shafts make contact with the intermediate thoughts and the dream thoughts now at one point and now at another. We can see how in this manner fresh daytime material inserts itself into the interpretative chains. It is probable, too, that the increase in resistance that has set in since the night makes new and more devious detours necessary. The number and nature of the collaterals [see p. 277 *n*. 1] that we spin in this way during the day is of no psychological importance whatever, so long as they lead us to the dream thoughts of which we are in search.

1 [*Footnote added* 1909:] These two theorems, which sounded most implausible at the time they were made, have since been experimentally employed and confirmed by Jung and his pupils in their studies in word association. [Jung, 1906, 1909. – A most interesting argument on the allied topic of the validity of chains of association starting from numbers selected 'by chance' (see above, p. 460) is developed by Freud in the long addendum of 1920 to Chapter XII (A, No. 7) of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 213 ff.]

(B)
REGRESSION

[533] Having now repelled the objections that have been raised against us, or having at least indicated where our defensive weapons lie, we must no longer postpone the task of setting about the psychological investigations for which we have so long been arming ourselves. Let us summarize the principal findings of our enquiry so far as it has gone. Dreams are psychical acts of as much significance as any others; their driving force [*Triebkraft*] is in every instance a wish seeking fulfilment; the fact of their not being recognizable as wishes and their many peculiarities and absurdities are due to the influence of the psychical censorship to which they have been subjected during the process of their formation; apart from the necessity of evading this censorship, other factors which have contributed to their formation are a necessity for the condensation of their psychical material, a regard for the possibility of its being represented in sensory images and – though not invariably – a demand that the structure of the dream shall have a rational and intelligible exterior. Each of these propositions opens a way to fresh psychological postulates and speculations; the mutual relation between the wish which is the dream's motive force [*Wunschmotivs*] and the four conditions to which the dream's formation is subject, as well as the interrelations between the latter, need to be investigated; and the place of dreams in the nexus of mental life has to be assigned.

It was with a view to reminding us of the problems which have still to be solved that I opened the present chapter with an account of a dream. There was no difficulty in interpreting that dream – the dream of the burning child – even though its interpretation was not given fully in our sense. I raised the question of why the dreamer dreamt it at all instead of waking up, and recognized that one of his motives was a wish to represent his child as still alive. Our further discussions will show us that yet another wish also played a part. [See below, p. 510.] Thus it was in the [534] first instance for the sake of fulfilling a wish that the process of thought during sleep was transformed into a dream.

If we eliminate the wish fulfilment, we shall see that only one feature is left to distinguish the two forms of psychical event. The dream thought would have run: 'I see a glare coming from the room where the dead body is lying. Perhaps a candle has fallen over and my child may be

burning.' The dream repeated these reflections unaltered, but it represented them in a situation which was actually present and which could be perceived through the senses like a waking experience. Here we have the most general and the most striking psychological characteristic of the process of dreaming: a thought, and as a rule a thought of something that is wished, is objectified in the dream, is represented as a scene, or, as it seems to us, is experienced.

How, then, are we to explain this characteristic peculiarity of the dream-work, or, to put the question more modestly, how are we to find a place for it in the nexus of psychical processes?

If we look into the matter more closely we shall observe that two almost independent features stand out as characteristic of the form taken by this dream. One is the fact that the thought is represented as an immediate situation with the 'perhaps' omitted, and the other is the fact that the thought is transformed into visual images and speech.

In this particular dream the change made in the thoughts by the conversion of the expectation expressed by them into the present tense[1] may not seem particularly striking. This is because of what can only be described as the unusually subordinate part played in this dream by wish fulfilment. Consider instead another one, in which the dream wish was not detached from the waking thoughts that were carried over into sleep – for instance, the dream of Irma's injection [p. 94 ff. above]. There the dream thought that was represented was in the optative: 'If only Otto were responsible for Irma's illness!' The dream repressed the optative and replaced it with a straightforward present: 'Yes, Otto is responsible for Irma's illness.' This, then, is the first of the transformations which is brought about in the dream thoughts even by a distortionless dream. We need not linger long over this first peculiarity of dreams. We can deal with it by drawing attention to conscious phantasies – to daydreams – which treat their ideational content in just the same manner. While Daudet's Monsieur [535]
Joyeuse[2] was wandering, out of work, through the streets of Paris (though his daughters believed that he had a job and was sitting in an office), he was dreaming of developments that might bring him influential help and lead to his finding employment – and he was dreaming in the present tense. Thus dreams make use of the present tense in the

1 [The fact that the dream-work translates the optative mood of the latent thoughts into the present indicative is often lost in the English translation. See *RSE*, **24**, 109.]

2 [In *Le Nabab* (cf. p. 440 above). A slip made by Freud over this name in his first draft of this sentence is discussed by him in his *Psychopathology of Everyday Life* (1901*b*), Chapter VII, Section A; *RSE*, **6**, 129–30.]

same manner and by the same right as daydreams. The present tense is the one in which wishes are represented as fulfilled.

But dreams differ from daydreams in their second characteristic: namely, in the fact of their ideational content being transformed from thoughts into sensory images, to which belief is attached and which appear to be experienced. I must add at once that not every dream exhibits this transformation from idea into sensory image. There are dreams which consist only of thoughts but which cannot on that account be denied the essential nature of dreams. My 'Autodidasker' dream – 'the daytime phantasy with Professor N.' [p. 266 ff. above] – was of that kind; it included scarcely more sensory elements than if I had thought its content in the daytime. And in every dream of any considerable length there are elements which have not, like the rest, been given a sensory form, but which are simply thought or known, in the kind of way in which we are accustomed to think or know things in waking life. It should also be remembered here that it is not only in dreams that such transformations of ideas into sensory images occur: they are also found in hallucinations and visions, which may appear as independent entities, so to say, in health or as symptoms in the psychoneuroses. In short, the relation which we are examining now is not in any respect an exclusive one. Nevertheless, it remains true that this characteristic of dreams, when it is present, strikes us as being their most notable one; so that it would be impossible for us to imagine the dream-world without it. But in order to arrive at an understanding of it we must embark upon a discussion that will take us far afield.

As the starting point for our enquiry, I should like to pick out one from among many remarks made upon the theory of dreaming by those who
[536] have written on the subject. In the course of a short discussion on the topic of dreams, the great Fechner (1889, **2**, 520–1) puts forward the idea that *the scene of action of dreams is different from that of waking ideational life*. [Cf. above, p. 43.] This is the only hypothesis that makes the special peculiarities of dream life intelligible.[1]

What is presented to us in these words is the idea of *psychical locality*. I shall entirely disregard the fact that the mental apparatus [*seelische Apparat*][T] with which we are here concerned is also known to us in the form of an anatomical preparation, and I shall carefully avoid the temptation to determine psychical locality in any anatomical fashion. I shall

1 [In a letter to Fliess of February 9, 1898 (Freud, 1950*a*, Letter 83), Freud writes that this passage in Fechner is the only sensible remark he has found in the literature on dreams.]

remain upon psychological ground, and I propose simply to follow the suggestion that we should picture the instrument which carries out our mental functions as resembling a compound microscope or a photographic apparatus, or something of the kind. On that basis, psychical locality will correspond to a point inside the apparatus at which one of the preliminary stages of an image comes into being. In the microscope and telescope, as we know, these occur in part at ideal points, regions in which no tangible component of the apparatus is situated. I see no necessity to apologize for the imperfections of this or of any similar imagery. Analogies of this kind are only intended to assist us in our attempt to make the complications of mental functioning intelligible by dissecting the function and assigning its different constituents to different component parts of the apparatus. So far as I know, the experiment has not hitherto been made of using this method of dissection in order to investigate the way in which the mental instrument is put together, and I can see no harm in it.[1] We are justified, in my view, in giving free rein to our speculations so long as we retain the coolness of our judgement and do not mistake the scaffolding for the building. And since at our first approach to something unknown all that we need is the assistance of provisional ideas, I shall give preference in the first instance to hypotheses of the crudest and most concrete description.

Accordingly, we will picture the mental apparatus as a compound instrument, to the components of which we will give the name of 'agencies',[2] [537]
or (for the sake of greater clarity) 'systems'. It is to be anticipated, in the next place, that these systems may perhaps stand in a regular spatial relation to one another, in the same kind of way in which the various systems of lenses in a telescope are arranged behind one another. Strictly speaking, there is no need for the hypothesis that the psychical systems are actually arranged in a *spatial* order. It would be sufficient if a fixed order were established by the fact that in a given psychical process the excitation passes through the systems in a particular *temporal* sequence. In other processes the sequence may perhaps be a different one; that is a

1 [The transition from anatomical to functional dissection occurred gradually in Freud's early writings but it can be observed *in status nascendi* in his 'Project for a Scientific Psychology' (1950*a* [1895]; e.g. *RSE*, **1**, 344 *n*. 3; see also Gamwell & Solms, 2006). Many obscurities in the following pages only become intelligible with reference to the 'Project'; see the Editors' Introduction to the present work (*RSE*, **4**, xviii ff.).]

2 ['*Instanzen*', literally 'instances', in a sense similar to that in which the word occurs in the phrase 'a Court of First Instance'.]

possibility that we shall leave open. For the sake of brevity we will in future speak of the components of the apparatus as 'ψ-systems'.

The first thing that strikes us is that this apparatus, compounded of ψ-systems, has a sense or direction. All our psychical activity starts from stimuli (whether internal or external) and ends in innervations.[1] Accordingly, we shall ascribe a sensory and a motor end to the apparatus. At the sensory end there lies a system which receives perceptions; at the motor end there lies another, which opens the gateway to motor activity. Psychical processes advance in general from the perceptual end to the motor end. Thus the most general schematic picture of the psychical apparatus may be represented thus (Fig. 1):

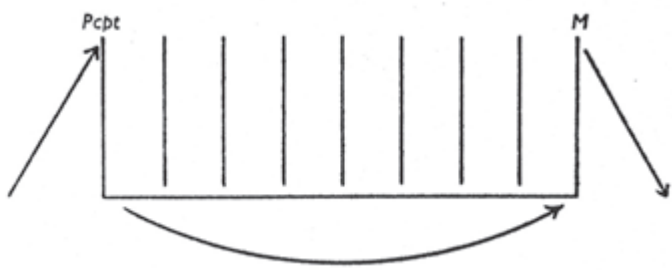

Fig. 1

[538] This, however, does no more than fulfil a requirement with which we have long been familiar, namely that the psychical apparatus must be constructed like a reflex apparatus. Reflex processes remain the model of every psychical function.

Next, we have grounds for introducing a first differentiation at the sensory end. A trace is left in our psychical apparatus of the perceptions which impinge upon it. This we may describe as a 'memory trace'; and to the function relating to it we give the name of 'memory'. If we are in earnest over our plan of attaching psychical processes to systems, memory traces can only consist in permanent modifications of the elements of the systems. But, as has already been pointed out elsewhere,[2] there are

1 ['Innervation' is an ambiguous term. It is very frequently used in a structural sense, to mean the anatomical distribution of nerves in some organism or bodily region. Freud uses it more often (though not invariably) to mean the transmission of energy into a system of nerves, or (as in the present instance) specifically into an *efferent* system – to indicate, that is to say, a process tending towards discharge.]

2 [By Breuer in a footnote to Section I of his theoretical contribution to Breuer & Freud, 1895*d*, where, among other things, he writes: 'The mirror of a reflecting telescope cannot at the same time be a photographic plate.' Cf. *RSE*, **2**, 168 *n*., where further references are given.]

obvious difficulties involved in supposing that one and the same system can accurately retain modifications of its elements and yet remain perpetually open to the reception of fresh occasions for modification. In accordance, therefore, with the principle which governs our experiment, we shall distribute these two functions on to different systems. We shall suppose that a system in the very front of the apparatus receives the perceptual stimuli but retains no trace of them and thus has no memory, while behind it there lies a second system which transforms the momentary excitations [*Erregung*]^{T} of the first system into permanent traces. The schematic picture of our psychical apparatus would then be as follows (Fig. 2):

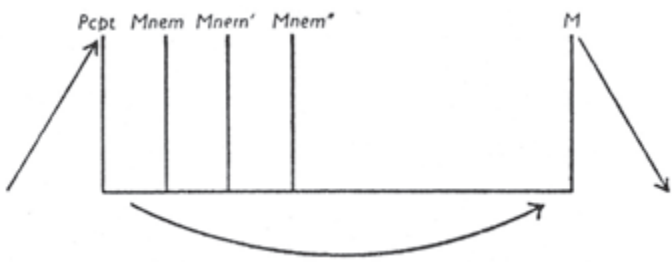

Fig. 2

It is a familiar fact that we retain permanently something more than the mere *content* of the perceptions which impinge upon the system [539]
Pcpt. Our perceptions are linked with one another in our memory – first and foremost according to simultaneity of occurrence. We speak of this fact as 'association'. It is clear, then, that, if the *Pcpt*. system has no memory whatever, it cannot retain any associative traces; the separate *Pcpt*. elements would be intolerably obstructed in performing their function if the remnant of an earlier connection were to exercise an influence upon a fresh perception. We must therefore assume the basis of association lies in the mnemic systems. Association would thus consist in the fact that, as a result of a diminution in resistances and of the laying down of facilitating paths, an excitation is transmitted from a given *Mnem*. element more readily to one *Mnem*. element than to another.

Closer consideration will show the necessity for supposing the existence not of one but of several such *Mnem*. elements, in which one and the same excitation, transmitted by the *Pcpt*. elements, leaves a variety of different permanent records. The first of these *Mnem*. systems will

naturally contain the record of association in respect to *simultaneity in time*; while the same perceptual material will be arranged in the later systems in respect to other kinds of coincidence, so that one of these later systems, for instance, will record relations of similarity, and so on with the others.[1] It would, of course, be a waste of time to try to put the psychical significance of a system of this kind into words. Its character would lie in the intimate details of its relations to the different elements of the raw material of memory, that is – if we may hint at a theory of a more radical kind – in the degrees of conductive resistance which it offered to the passage of excitation from those elements.

At this point I will interpolate a remark of a general nature which may perhaps have important implications. It is the *Pcpt*. system, which is without the capacity to retain modifications and is thus without memory, that provides our consciousness with the whole multiplicity of sensory qualities. On the other hand, our memories – not excepting those which are most deeply stamped on our minds – are in themselves [*an Sich*] unconscious.[2] They can be made conscious; but there can be no doubt that they can produce all their effects while in an unconscious condition. What we describe as our 'character' is based on the memory traces of our impressions; and, moreover, the impressions which have had the great-
[540] est effect on us – those of our earliest youth – are precisely the ones which scarcely ever become conscious. But if memories become conscious once more, they exhibit no sensory quality or a very slight one in comparison with perceptions. A most promising light would be thrown on the conditions governing the excitation of neurons if it could be confirmed that *in the ψ-systems memory and the quality that characterizes consciousness are mutually exclusive*.[3]

1 [Freud is here alluding to the 'laws of association', which had greatly exercised the empiricist philosophers. Cf. Freud (1901*b*), *RSE*, **6**, 222, where he speaks of the aspiration to 'transform *metaphysics* into *metapsychology*'.]

2 [The allusion to Kant's philosophy is not accidental, as Freud's later writings reveal (e.g. Freud, 1940*a* [1938]; *RSE*, **23**).]

3 [*Footnote added* 1925:] I have since suggested that consciousness actually arises *instead of* the memory trace. See my 'Note upon the "Mystic Writing-Pad"' (1925*a*), *RSE*, **19**, 228. [Cf. also Chapter IV of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 24 f., where the same point is made. – The whole of the present discussion on memory will be made more intelligible by a study of these two passages from Freud's later writings. But still more light is thrown on it by some of his earlier reflections on the subject revealed in the Fliess correspondence (Freud, 1950*a*). See, for instance, Section 3 of Part I of the 'Project for a Scientific Psychology' (written in the autumn of 1895) and Letter 52 (written on December 6, 1896). This letter, incidentally, contains what is evidently an early version of the 'schematic picture' represented above as well as the first appearance of the abbreviations by which the various systems are here distinguished. The equivalent English symbols are self-explanatory: '*Cs*.' for the 'conscious' system, '*Pcs*.' for the 'preconscious', '*Ucs*.' for the 'unconscious', '*Pcpt*.' for the 'perceptual' and '*Mnem*.' for the 'mnemic' systems.]

The assumptions we have so far put forward as to the construction of the psychical apparatus at its sensory end have been made without reference to dreams or to the psychological information that we have been able to infer from them. Evidence afforded by dreams will, however, help us towards understanding another portion of the apparatus. We have seen [see p. 127 ff. above] that we were only able to explain the formation of dreams by venturing upon the hypothesis of there being two psychical agencies, one of which submitted the activity of the other to a criticism which involved its exclusion from consciousness. The critical agency, we concluded, stands in a closer relation to consciousness than the agency criticized: it stands like a screen between the latter and consciousness. Further, we found reasons [p. 437 f.] for identifying the critical agency with the agency which directs our waking life and determines our voluntary, conscious actions. If, in accordance with our assumptions, we replace these agencies by systems, then our last conclusion must lead us to locate the critical system at the motor end of the apparatus. We will now introduce the two systems into our schematic [541] picture and give them names to express their relation to consciousness (Fig. 3):

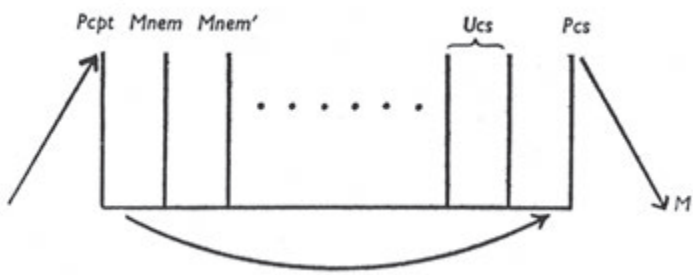

Fig. 3

We will describe the last of the systems at the motor end as 'the preconscious', to indicate that the excitatory processes occurring in it can enter consciousness without further impediment provided that certain other conditions are fulfilled: for instance, that they reach a certain degree of intensity, that the function which can only be described as 'attention' is distributed in a particular way [see p. 530 f.], and so on. This is at the same time the system which holds the key to voluntary movement. We will describe the system that lies behind it as 'the unconscious', because it has no access to consciousness *except via the preconscious*, in

passing through which its excitatory process is obliged to submit to modifications.[1]

In which of these systems, then, are we to locate the impetus to the construction of dreams? For simplicity's sake, in the system *Ucs*. It is true that in the course of our future discussion we shall learn that this is not entirely accurate, and that the process of forming dreams is obliged to attach itself to dream thoughts belonging to the preconscious system [p. 503 below]. But when we consider the dream wish, we shall find that the driving force [*Triebkraft*] for producing dreams is supplied by the
[542] *Ucs*. [p. 501 f.]; and owing to this latter factor we shall take the unconscious system as the starting point of dream formation. Like all other thought structures [*Gedankenbildungen*], this dream instigator will make an effort to advance into the *Pcs*. and from there to obtain access to consciousness.

Experience shows us that this path leading through the preconscious to consciousness is barred to the dream thoughts during the daytime by the censorship imposed by resistance. During the night they are able to obtain access to consciousness; but the question arises as to how they do so and thanks to what modification. If what enabled the dream thoughts to achieve this were the fact that at night there is a lowering of the resistance which guards the frontier between the unconscious and the preconscious, we should have dreams which were in the nature of ideas and which were without the hallucinatory quality in which we are at the moment interested. Thus the lowering of the censorship between the two systems *Ucs*. and *Pcs*. can only explain dreams formed like 'Autodidasker' and not dreams like that of the burning child which we took as the starting point of our investigations.

The only way in which we can describe what happens in hallucinatory dreams is by saying that the excitation moves in a *retrogressive* direction. Instead of being transmitted towards the *motor* end of the apparatus it moves towards the *sensory* end and finally reaches the perceptual system. If we describe as 'progressive' the direction taken by psychical

1 [*Footnote added* 1919:] If we attempted to proceed further with this schematic picture, in which the systems are set out in linear succession, we should have to reckon with the fact that the system next beyond the *Pcs*. is the one to which consciousness must be ascribed – in other words, that *Pcpt*. = *Cs*. [Also, *Cs*. = *M*. (consciousness entails motor discharge) and *M*. = *Pcpt*. (action generates perception). Cf. Freud's earlier 'schematic picture' in *RSE*, **1**, 261. For a fuller discussion of this, see Freud (1916–17*f* [1915]), ibid., **14**, 206. See also the Editors' Introduction to the 1895 'Project' (1950*a*; ibid., **1**, 313 f. *n*. 2) and associated footnotes, especially ibid., **1**, 350 f. *n*. 4. – Freud's later 'schematic picture' of the mind, first given in *The Ego and the Id* (1923*b*), Chapter II, ibid., **19**, 16 ff., and repeated (with some modifications) in the *New Introductory Lectures* (1933*a*), Lecture XXXI; ibid., **22**, 51 ff., lays more stress on mental structure than on the temporal sequence of mental processing.]

processes arising from the unconscious during waking life, then we may speak of dreams as having a 'regressive' character.[1]

This regression, then, is undoubtedly one of the psychological characteristics of the process of dreaming; but we must remember that it does not occur only in dreams. Intentional recollection and other constituent [543]
processes of our normal thinking involve a retrogressive movement in the psychical apparatus from a complex ideational act back to the raw material of the memory traces underlying it. In the waking state, however, this backward movement never extends beyond the mnemic images; it does not succeed in producing a hallucinatory revival of the *perceptual* images. Why is it otherwise in dreams? When we were considering the work of condensation in dreams we were driven to suppose that the intensities attaching to ideas can be completely transferred by the dream-work from one idea to another [p. 293 f. above]. It is probably this alteration in the normal psychical procedure which makes possible the cathexis [*besetzen*][T] of the system *Pcpt*. in the reverse direction, starting *Besetzung*
from thoughts, to the pitch of complete sensory vividness.

We must not delude ourselves into exaggerating the importance of these considerations. We have done no more than give a name to an inexplicable phenomenon. We call it 'regression' when in a dream an idea is turned back into the sensory image from which it was originally derived. But even this step requires justification. What is the point of this nomenclature if it teaches us nothing new? I believe the name 'regression' is of help to us insofar as it connects a fact that was already known to us with our schematic picture, in which the mental apparatus was given a sense or direction. And it is at this point that that picture begins to repay us for having constructed it. For an examination of it, without any further reflection, reveals a further characteristic of dream formation. If we regard the process of dreaming as a regression occurring in our hypothetical mental apparatus, we at once arrive at the explanation of the empirically established fact that all the logical relations belonging to the dream thoughts disappear during the dream activity or can only find expression with difficulty [p. 277 f.]. According to our schematic

1 [*Footnote added* 1914:] The first hint at the factor of regression is to be found as far back as in Albertus Magnus [the thirteenth-century Scholastic writer]. The '*imaginatio*', he tells us, constructs dreams out of the stored-up images of sensory objects; and the process is carried out in a reverse direction to that in waking life. (Quoted by Diepgen, 1912, 14.) – Hobbes writes in the *Leviathan* (1651, Pt. I, Chapter 2): 'In sum, our dreams are the reverse of our waking imaginations, the motion, when we are awake, beginning at one end, and when we dream at another.' (Quoted by Havelock Ellis, 1911*a*, 109.) – [Breuer, in Section 1 of Chapter III of Breuer & Freud, 1895*d*, speaks (in connection with hallucinations) of a '"retrogressive" excitation, emanating from the organ of memory and acting on the perceptual apparatus by means of ideas'.]

picture, these relations are contained not in the *first Mnem.* systems but in *later* ones; and in case of regression they would necessarily lose any means of expression except in perceptual images. *In regression the fabric of the dream thoughts is resolved into its raw material.*

What modification is it that renders possible a regression which cannot occur in daytime? We must be content with some conjectures on this point. No doubt it is a question of changes in the cathexes of energy [544] [*Energiebesetzungen*] attaching to the different systems, changes which increase or diminish the facility with which those systems can be passed through by the excitatory process. But in any apparatus of this kind the *ablaufen* same results upon the passage of excitations [*Ablauf der Erregung*]^{T} might be produced in more than one way. Our first thoughts will, of course, be of the state of sleep and the changes in cathexis which it brings about at the sensory end of the apparatus. During the day there is a continuous current from the *Pcpt.* ψ-system flowing in the direction of motor activity; but this current ceases at night and could no longer form an obstacle to a current of excitation flowing in the opposite sense. Here we seem to have the 'shutting out of the external world', which some authorities regard as the theoretical explanation of the psychological characteristics of dreams. (See p. 45 f.)

In explaining regression in dreams, however, we must bear in mind the regressions which also occur in pathological waking states; and here the explanation just given leaves us in the lurch. For in those cases regression occurs in spite of a sensory current flowing without interruption in a forward direction. My explanation of hallucinations in hysteria and paranoia and of visions in mentally normal subjects is that they are in fact regressions – that is, thoughts transformed into images – but that the only thoughts that undergo this transformation are those which are intimately linked with memories that have been suppressed [*unterdrückten*] or have remained unconscious.

For instance, one of my youngest hysterical patients, a twelve-year-old boy, was prevented from falling asleep by '*green faces with red eyes*' which terrified him. The source of this phenomenon was a suppressed, though at one time conscious, memory of a boy whom he had often seen four years earlier. This boy had presented him with an alarming picture of the consequences of bad habits in children, including masturbation – a habit with which my patient was now reproaching himself in retrospect [*nachträglich*]. His mother had pointed out at the time that the ill-behaved boy had a *greenish face* and *red* (i.e. red-rimmed) *eyes*. Here was the origin of his bogey, whose only purpose, incidentally, was to remind

him of another of his mother's predictions – that boys of that sort grow into idiots, can learn nothing at school and die young. My little patient had fulfilled one part of the prophecy, for he was making no progress at his school, and, as was shown from his account of the involuntary thoughts that occurred to him, he was terrified of the other part. I may [545] add that after a short time the treatment resulted in his being able to sleep, in his nervousness disappearing and his being awarded a mark of distinction at the end of his school year.

In the same connection I will give the explanation of a vision that was described to me by another hysterical patient (a woman of forty) as having happened before she fell ill. One morning she opened her eyes and saw her brother in the room, though, as she knew, he was, in fact, in an insane asylum. Her small son was sleeping in the bed beside her. To save the child from having a *fright* and *falling into convulsions* when he saw his *uncle*, she pulled the *sheet* over his face, whereupon the apparition vanished. This vision was a modified version of a memory from the lady's childhood; and, though it was conscious, it was intimately related to all the unconscious material in her mind. Her nurse had told her that her mother (who had died very young, when my patient was only eighteen months old) had suffered from epileptic or hysterical *convulsions*, which went back to a *fright* caused by her brother (my patient's *uncle*) appearing to her disguised as a ghost with a *sheet* over his head. Thus the vision contained the same elements as the memory: the brother's appearance, the sheet, the fright and its results. But the elements had been arranged in a different context and transferred on to other figures. The obvious motive of the vision, or of the thoughts which it replaced, was her concern lest her little boy might follow in the footsteps of his uncle, whom he greatly resembled physically.

The two instances that I have quoted are neither of them entirely devoid of connection with the state of sleep and for that reason are perhaps not well chosen for what I want them to prove. I will therefore refer the reader to my analysis of a woman suffering from hallucinatory paranoia (Freud, 1896*b* [*RSE*, **3**, 184 ff.]) as well as to the findings in my still unpublished studies on the psychology of the psychoneuroses,[1] for evidence that in such instances of the regressive transformation of thoughts we must not overlook the influence of memories, mostly from childhood, which have been suppressed or have remained unconscious. The thoughts which are connected with a memory of this kind and which are forbidden expression by the censorship are, as it were, attracted by the

1 [Never published under any such title.]

memory into regression as being the form of representation in which the
[546] memory itself is couched. I may also recall that one of the facts arrived at in the *Studies on Hysteria* [Breuer & Freud, 1895*d* – e.g. in Breuer's first case history] was that when it was possible to bring infantile scenes (whether they were memories or phantasies) into consciousness, they were seen like hallucinations and lost that characteristic only in the process of being reported. It is, moreover, a familiar observation that, even in those whose memory is not normally of a visual type, the earliest recollections of childhood retain far into life the quality of sensory vividness.

If we now bear in mind how great a part is played in the dream thoughts by infantile experiences or by phantasies based upon them, how frequently portions of them re-emerge in the dream content and how often the dream wishes themselves are derived from them, we cannot dismiss the probability that in dreams too the transformation of thoughts into visual images may be in part the result of the *attraction* which memories couched in visual form and eager for revival bring to bear upon thoughts cut off from consciousness and struggling to find expression. On this view a dream might be described as *a substitute for an infantile scene modified by being transferred* [*durch Übertragung*][T] *on to a recent experience*. The infantile scene is unable to bring about its own revival and has to be content with returning as a dream.

This indication of the way in which infantile scenes (or their reproductions as phantasies) function in a sense as models for the content of dreams removes the necessity for one of the hypotheses put forward by Scherner and his followers in regard to internal sources of stimulation. Scherner [1861] supposes that, when dreams exhibit particularly vivid or particularly copious visual elements, there is present a state of 'visual stimulation', that is, of internal excitation in the organ of vision [cf. p. 201 above]. We need not dispute this hypothesis, but can content ourselves with assuming that this state of excitation applies merely to the *psychical* perceptual system of the visual organ; we may, however, further point out that the state of excitation has been set up by a *memory*, that it is a *revival* of a visual excitation which was originally an immediate one. I cannot produce any good example from my own experience of an *infantile* memory producing this kind of result. My dreams are in general less rich in sensory elements than I am led to suppose is the case in other people. But in the case of my most vivid and beautiful dream of the
[547] last few years I was easily able to trace back the hallucinatory clarity of the dream's content to the sensory qualities of recent or fairly recent

impressions. On p. 414 ff. I recorded a dream in which the deep blue colour of the water, the brown of the smoke coming from the ship's funnels, and the dark brown and red of the buildings left behind a profound impression on me. This dream, if any, should be traceable to a visual stimulus. What was it that had brought my visual organ into this state of stimulation? A recent impression, which attached itself to a number of earlier ones. The colours which I saw were in the first instance those of a box of toy bricks with which, on the day before the dream, my children had put up a fine building and shown it off for my admiration. The big bricks were of the same dark red and the small ones were of the same blue and brown. This was associated with colour impressions from my last travels in Italy: the beautiful blue of the Isonzo and the lagoons and the brown of the Carso.[1] The beauty of the colours in the dream was only a repetition of something seen in my memory.

Let us bring together what we have found out about the peculiar propensity of dreams to recast their ideational content into sensory images. We have not explained this feature of the dream-work, we have not traced it back to any known psychological laws; but we have rather picked it out as something that suggests unknown implications and we have characterized it with the word 'regressive'. We have put forward the view that in all probability this regression, wherever it may occur, is an effect of a resistance opposing the progress of a thought into consciousness along the normal path, and of a simultaneous attraction exercised upon the thought by the presence of memories possessing great sensory force.[2] In the case of dreams, regression may perhaps be further facilitated by the cessation of the progressive current which streams in during the daytime from the sense organs; in other forms of regression, the absence of this [548]
accessory factor must be made up for by a greater intensity of the other motives for regression. Nor must we forget to observe that in these pathological cases of regression as well as in dreams the process of transference of energy [*Energieübertragung*] must differ from what it is in regressions occurring in normal mental life, since in the former cases that process makes possible a complete hallucinatory cathexis of the perceptual systems. What we have described, in our analysis of the dream-work,

1 [The limestone plateau behind Trieste.]

2 [*Footnote added* 1914:] In any account of the theory of repression [*Verdrängung*] it would have to be laid down that a thought becomes repressed as a result of the combined influence upon it of *two* factors. It is pushed from the one side (by the censorship of the *Cs*.) and pulled from the other (by the *Ucs*.), in the same kind of way in which people are conveyed to the top of the Great Pyramid. [*Added* 1919:] Cf. my paper on repression (Freud, 1915*d*) [*RSE*, **14**, 130–3].

as 'considerations of representability' might be brought into connection with the *selective attraction* exercised by the visually recollected scenes touched upon by the dream thoughts.

It is further to be remarked[1] that regression plays a no less important part in the theory of the formation of neurotic symptoms than it does in that of dreams. Three kinds of regression are thus to be distinguished: (*a*) *topographical* regression, in the sense of the schematic picture of the ψ-systems which we have explained above; (*b*) *temporal* regression, insofar as what is in question is a harking back to older psychical structures [*psychische Bildungen*]; and (*c*) *formal* regression, where primitive methods of expression and representation take the place of the usual ones. All these three kinds of regression are, however, one at bottom and occur together as a rule; for what is older in time is more primitive in form and in psychical topography lies nearer to the perceptual end. [Cf. Freud, 1916–17*f* [1915], where this sentence is qualified.]

Nor can we leave the subject of regression in dreams[2] without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psychoneuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the drive impulses [*Triebregungen*] which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood – a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's [549] assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psychoanalysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race.

1 [This paragraph was added in 1914.]

2 [This paragraph was added in 1919.]

It may well be that this first portion of our psychological study of dreams will leave us with a sense of dissatisfaction. But we can console ourselves with the thought that we have been obliged to build our way out into the dark. If we are not wholly in error, other lines of approach are bound to lead us into much the same region and the time may then come when we shall find ourselves more at home in it.

(C)
WISH FULFILMENT

[550] The dream of the burning child at the beginning of this chapter gives us a welcome opportunity of considering the difficulties with which the theory of wish fulfilment is faced. It will no doubt have surprised all of us to be told that dreams are nothing other than fulfilments of wishes, and not only on account of the contradiction offered by anxiety dreams. When analysis first revealed to us that a meaning and a psychical value lay concealed behind dreams, we were no doubt quite unprepared to find that that meaning was of such a uniform character. According to Aristotle's accurate but bald definition, a dream is thinking that persists (insofar as we are asleep) in the state of sleep. [Cf. p. 2 above.] Since, then, our daytime thinking produces psychical acts of such various sorts – judgements, inferences, denials, expectations, intentions, and so on – why should it be obliged during the night to restrict itself to the production of wishes alone? Are there not, on the contrary, numerous dreams which show us psychical acts of other kinds – worries, for instance – transformed into dream-shape? And was not the dream with which we began this chapter (a quite particularly transparent one) precisely a dream of this sort? When the glare of light fell on the eyes of the sleeping father, he drew the worrying conclusion that a candle had fallen over and might have set the dead body on fire. He turned this conclusion into a dream by clothing it in a sensory situation and in the present tense. What part was played in this by wish fulfilment? can we fail to see in it the predominating influence of a thought persisting from waking life or stimulated by a new sense impression? All this is quite true and compels us to enter more closely into the part played by wish fulfilment in dreams and into the importance of waking thoughts which persist into sleep.

We have already been led by wish fulfilment itself to divide dreams into two groups. We have found some dreams which appeared openly as wish fulfilments, and others in which the wish fulfilment was unrecog-
[551] nizable and often disguised by every possible means. In the latter we have perceived the dream censorship at work. We found the undistorted wishful dreams principally in children; though *short*, frankly wishful dreams *seemed* (and I lay emphasis upon this qualification) to occur in adults as well.

We may next ask where the wishes that come true in dreams originate. What contrasting possibilities or what alternatives have we in mind in raising this question? It is the contrast, I think, between the consciously perceived life of daytime and a psychical activity which has remained unconscious and of which we can only become aware at night. I can distinguish three possible origins for such a wish. (1) It may have been aroused during the day and for external reasons may not have been satisfied; in that case an acknowledged wish which has not been dealt with is left over for the night. (2) It may have arisen during the day but been repudiated; in that case what is left over is a wish which has not been dealt with but has been suppressed. (3) It may have no connection with daytime life and be one of those wishes which only emerge from the suppressed part of the mind and become active in us at night. If we turn again to our schematic picture of the psychical apparatus, we shall localize wishes of the first kind in the system *Pcs*.; we shall suppose that wishes of the second kind have been driven out of the system *Pcs*. into the *Ucs*., where, if at all, they continue to exist; and we shall conclude that wishful impulses of the third kind are altogether incapable of passing beyond the system *Ucs*. The question then arises whether wishes derived from these different sources are of equal importance for dreams and have equal power to instigate them.

If we cast our minds over the dreams that are at our disposal for answering this question, we shall at once be reminded that we must add a fourth source of dream wishes, namely the current wishful impulses that arise during the night (e.g. those stimulated by thirst or sexual needs). In the next place, we shall form the opinion that the place of origin of a dream wish probably has no influence on its capacity for instigating dreams. I may recall the little girl's dream which prolonged a trip on the lake that had been interrupted during the day and the other children's dreams which I have recorded. [See p. 113 ff. above.] They were explained as being due to unfulfilled, but unsuppressed, wishes from the previous day. Instances of a wish that has been suppressed in the daytime finding its way out in a dream are exceedingly numerous. I will add a further very simple example of this class. The dreamer was a lady who was rather fond of making fun of people and one of whose friends, a woman younger than herself, had just become engaged. All day long she had been asked by her acquaintances whether she knew the young man and what she thought of him. She had replied with nothing but praises, with which she had silenced her real judgement; for she would have liked to tell the truth – that he was a '*Dutzendmensch*' [literally a [552]

'dozen man', a very commonplace sort of person – people like him are turned out by the *dozen*]. She dreamt that night that she was asked the same question, and replied with the formula: '*In the case of repeat orders it is sufficient to quote the number*.' We have learnt, lastly, from numerous analyses that wherever a dream has undergone distortion the wish has arisen from the unconscious and was one which could not be perceived during the day. Thus it seems at first glance as though all wishes are of equal importance and equal power in dreams.

I cannot offer any proof here that the truth is nevertheless otherwise; but I may say that I am strongly inclined to suppose that dream wishes are more strictly determined. It is true that children's dreams prove beyond a doubt that a wish that has not been dealt with during the day can act as a dream instigator. But it must not be forgotten that it is a *child's* wish, a wishful impulse of the strength proper to children. I think it is highly doubtful whether in the case of an adult a wish that has not been fulfilled during the day would be strong enough to produce a dream. It seems to me, on the contrary, that, with the progressive control exercised upon the life of our drives by our thought activity, we are more and more inclined to renounce as unprofitable the formation or retention of such intense wishes as children know. It is possible that there are individual differences in this respect, and that some people retain an infantile type of mental process longer than others, just as there are similar differences in regard to the diminution of visual imagery, which is so vivid in early years. But in general, I think, a wish that has been left over unfulfilled from the previous day is insufficient to produce a dream in the case of an adult. I readily admit that a wishful impulse originating in the conscious
[553] will *contribute* to the instigation of a dream, but it will probably not do more than that. The dream would not materialize if the preconscious wish did not succeed in finding reinforcement from elsewhere.

From the unconscious, in fact. *My supposition is that a conscious wish can only become a dream instigator if it succeeds in awakening an unconscious wish with the same tenor and in obtaining reinforcement from it*. From indications derived from the psychoanalysis of the neuroses, I consider that these unconscious wishes are always on the alert, ready at any time to find their way to expression when an opportunity arises for allying themselves with an impulse from the conscious and for transferring [*übertragen*] their own great intensity on to the latter's lesser one.[1] It will then *appear* as though the conscious wish alone had been

1 They share this character of indestructibility with all other mental acts which are truly unconscious, i.e. which belong to the system *Ucs*. only. These are paths which have been laid down once and for all, which never fall into disuse and which, whenever an unconscious excitation recathects them, are always ready to conduct the excitatory process to discharge. If I may use a

realized in the dream; only some small peculiarity in the dream's configuration will serve as a finger-post to put us on the track of the powerful ally from the unconscious. These wishes in our unconscious, ever on the alert and, so to say, immortal, remind one of the legendary Titans, weighed down since primaeval ages by the massive bulk of the mountains which were once hurled upon them by the victorious gods and which are still shaken from time to time by the convulsion of their limbs. But these wishes, held under repression, are themselves of infantile origin, as we are taught by psychological research into the neuroses. I would propose, therefore, to set aside the assertion made just now [p. 493 above], that the place of origin of dream wishes is a matter of indifference and replace it with another one to the following effect: *a wish which is represented in a dream must be an infantile one*. In the case of adults it originates from the *Ucs*.; in the case of children, where there is as yet no division or censorship between the *Pcs*. and the *Ucs*., or where that division is only gradually being set up, it is an unfulfilled, unrepressed wish from waking life. I am [554] aware that this assertion cannot be proved to hold universally; but it can be proved to hold frequently, even in unsuspected cases, and it cannot be *contradicted* as a general proposition.

In my view, therefore, wishful impulses [*Wunschregungen*] left over from conscious waking life must be relegated to a secondary position in respect to the formation of dreams. I cannot allow that, as contributors to the content of dreams, they play any other part than is played, for instance, by the material of sensations which become currently active during sleep. (See pp. 202–3.) I shall follow the same line of thought in now turning to consider those psychical instigations to dreaming, left over from waking life, which are *other* than wishes. When we decide to go to sleep, we may succeed in temporarily bringing to an end the cathexes of energy attaching to our waking thoughts. Anyone who can do this easily is a good sleeper; the first Napoleon seems to have been a model of this class. But we do not always succeed in doing so, nor do we always succeed completely. Unsolved problems, tormenting worries, overwhelming impressions – all these carry thought activity over into sleep and sustain mental processes in the system that we have named the preconscious. If we wish to classify the thought impulses which persist in sleep, we may divide them into the following groups: (1) what has not

simile, they are only capable of annihilation in the same sense as the ghosts in the underworld of the *Odyssey* – ghosts which awoke to new life as soon as they tasted blood. Processes which are dependent on the preconscious system are destructible in quite another sense. The psychotherapy of the neuroses is based on this distinction. [See below, p. 517.]

been carried to a conclusion during the day owing to some chance hindrance; (2) what has not been dealt with owing to the insufficiency of our intellectual power – what is unsolved; (3) what has been rejected and suppressed during the daytime. To these we must add (4) a powerful group consisting of what has been set in action in our *Ucs*. by the activity of the preconscious in the course of the day; and finally (5) the group of daytime impressions which are indifferent and have for that reason not been dealt with.

There is no need to underestimate the importance of the psychical intensities which are introduced into the state of sleep by these residues of daytime life, and particularly of those in the group of unsolved problems. It is certain that these excitations continue to struggle for expression during the night; and we may assume with equal certainty that the state of sleep makes it impossible for the excitatory process to be pursued in
[555] the habitual manner in the preconscious and brought to an end by becoming conscious. Insofar as our thought processes are able to become conscious in the normal way at night, we are simply not asleep. I am unable to say what modification in the system *Pcs*. is brought about by the state of sleep;[1] but there can be no doubt that the psychological characteristics of sleep are to be looked for essentially in modifications in the cathexis of this particular system – a system that is also in control of access to the power of movement, which is paralysed during sleep. On the other hand, nothing in the psychology of dreams gives me reason to suppose that sleep produces any modifications other than secondary ones in the state of things prevailing in the system *Ucs*. No other course, then, lies open to excitations occurring at night in the *Pcs*. than that followed by wishful excitations arising from the *Ucs*.; the preconscious excitations must find reinforcement from the *Ucs*. and must accompany the unconscious excitations along their circuitous paths. But what is the relation of the preconscious residues of the previous day to *dreams*? There is no doubt that they find their way into dreams in great quantity, and that they make use of the content of dreams in order to penetrate into consciousness even during the night. Indeed, they occasionally dominate the content of a dream and force it to carry on the activity of daytime. It is certain, too, that the day's residues may be of any other character just as easily as wishes; but it is highly instructive in this connection, and of positively decisive importance for the theory of

1 [*Footnote added* 1919:] I have tried to penetrate further into an understanding of the state of things prevailing during sleep and of the determining conditions of hallucination in a paper entitled 'A Metapsychological Supplement to the Theory of Dreams' [Freud (1916–17*f* [1915]), *RSE*, **14**, 197 ff.].

wish fulfilment, to observe the condition to which they must submit in order to be received into a dream.

Let us take one of the dreams I have already recorded – for instance, the one in which my friend Otto appeared with the signs of Graves' disease. (See p. 239 f.) I had been worried during the previous day by Otto's looks; and, like everything else concerned with him, this worry affected me closely. And it pursued me, as I may assume, into my sleep. I was probably anxious to discover what could be wrong with him. This worry found expression during the night in the dream I have described, the content of which was in the first place nonsensical and in the second place was in no respect the fulfilment of a wish. I then began to investi- [556]
gate the origin of this inappropriate expression of the worry I had felt during the day, and by means of analysis I found a connection through the fact of my having identified my friend with a certain Baron L. and myself with Professor R. There was only one explanation of my having been obliged to choose this particular substitute for my daytime thought. I must have been prepared at all times in my *Ucs*. to identify myself with Professor R., since by means of that identification one of the immortal wishes of childhood – the megalomaniac wish – was fulfilled. Ugly thoughts hostile to my friend, which were certain to be repudiated during the day, had seized the opportunity of slipping through with the wish and getting themselves represented in the dream; but my daytime worry had also found some sort of expression in the content of the dream by means of a substitute. [Cf. p. 236 f. above.] The daytime thought, which was not in itself a wish but on the contrary a worry, was obliged to find a connection in some way or other with an infantile wish which was now unconscious and suppressed, and which would enable it – suitably decocted, it is true – to 'originate' in consciousness. The more dominating was the worry, the more far-fetched a link could be established; there was no necessity for there being any connection whatever between the content of the wish and that of the worry, and in fact no such connection existed in our example.

It may perhaps be useful[1] to continue our examination of the same question by considering how a dream behaves when the dream thoughts present it with material which is the complete reverse of a wish fulfilment – well-justified worries, painful reflections, distressing realizations. The many possible outcomes can be classed under the two following groups. (A) The dream-work may succeed in replacing all the distressing ideas

1 [This paragraph and the two following ones were added in 1919.]

with contrary ones and in suppressing the unpleasurable affects attaching to them. The result will be a straightforward dream of satisfaction, a palpable 'wish fulfilment', about which there seems no more to be said. (B) The distressing ideas may make their way, more or less modified but nonetheless quite recognizable, into the manifest content of the dream. This is the case which raises doubts as to the validity of the wish theory of dreams and needs further investigation. Dreams of this sort with a
[557] distressing content may either be experienced with indifference, or they may be accompanied by the whole of the distressing affect which their ideational content seems to justify, or they may even lead to the development of anxiety and to awakening.

Analysis is able to demonstrate that these unpleasurable dreams are wish fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 519 f. *n*.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues [cf. p. 420 f. above]; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the constructing of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety dreams are just as much wish fulfilments in the sense of our theory as are straightforward dreams of satisfaction.

Unpleasurable dreams may also be 'punishment dreams'. [See p. 423 ff.] It must be admitted that their recognition means in a certain sense a new addition to the theory of dreams. What is fulfilled in them is equally an unconscious wish, namely a wish that the dreamer may be punished for a repressed and forbidden wishful impulse. To that extent dreams of this kind fall in with the condition that has been laid down here that the

driving force [*Triebkraft*] for constructing a dream must be provided by a wish belonging to the unconscious. A closer psychological analysis, however, shows how they differ from other wishful dreams. In the cases forming Group B the dream-constructing wish is an unconscious one [558] and belongs to the repressed, while in punishment dreams, though it is equally an unconscious one, it must be reckoned as belonging not to the repressed but to the 'ego' [*Ich*]. Thus punishment dreams indicate the possibility that the ego may have a greater share than was supposed in the construction of dreams. The mechanism of dream formation would in general be greatly clarified if instead of the opposition between 'conscious' and 'unconscious' we were to speak of that between the 'ego' and the 'repressed'. This cannot be done, however, without taking account of the processes underlying the psychoneuroses, and for that reason it has not been carried out in the present work. I will add only that punishment dreams are not in general subject to the condition that the day's residues shall be of a distressing kind. On the contrary, they occur most easily where the opposite is the case – where the day's residues are thoughts of a satisfying nature but the satisfaction which they express is a forbidden one. The only trace of these thoughts that appears in the manifest dream is their diametric opposite, just as in the case of dreams belonging to Group A. The essential characteristic of punishment dreams would thus be that in their case the dream-constructing wish is not an unconscious wish derived from the repressed (from the system *Ucs*.), but a punitive one reacting against it and belonging to the ego, though at the same time an unconscious (that is to say, preconscious) one.[1]

I will report a dream of my own[2] in order to illustrate what I have just said, and in particular the way in which the dream-work deals with a residue of distressing anticipations from the previous day.

'Indistinct beginning. *I said to my wife that I had a piece of news for her, something quite special. She was alarmed and refused to listen. I assured her that on the contrary it was something that she would be very glad to hear, and began to tell her that our son's officers' mess had sent a sum of money (5000 Kronen?) . . . something about distinction . . . distribution. . . . Meanwhile I had gone with her into a small room, like a* [559] *store-room, to look for something. Suddenly I saw my son appear. He was*

1 [*Footnote added* 1930:] This would be the appropriate point for a reference to the 'superego' [*Überich*]^{T}, one of the later findings of psychoanalysis. [Cf. p. 426 *n*. 1 above. – A class of dreams which are an exception to the 'wish theory' (those which occur in traumatic neuroses) is discussed in Chapter II of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 13, and in the last pages of Lecture XXIX in the *New Introductory Lectures* (1933*a*), ibid., **22**, 26–7.]

2 [This paragraph and the two following ones were added as a footnote in 1919, and incorporated in the text in 1930.]

not in uniform but in tight-fitting sports clothes (like a seal?), with a little cap. He climbed up on to a basket that was standing beside a cupboard, as though he wanted to put something on the cupboard. I called out to him: no reply. It seemed to me that his face or forehead was bandaged. He was adjusting something in his mouth, pushing something into it. And his hair was flecked with grey. I thought: "Could he be as exhausted as all that? And has he got false teeth?" Before I could call out again I woke up, feeling no anxiety but with my heart beating rapidly. My bedside clock showed that it was two-thirty.'

Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate – something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A 'distinction' is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish fulfilment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer [1912] has described as 'threshold symbolism'. [Cf. above, p. 451 f.]) We cannot tell, it is true, what it was that provided the dream with the driving force [*Triebkraft*] for thus giving expression to my distressing thoughts. My son did not appear as someone 'falling' but as someone 'climbing'. He had, in fact, been a keen mountaineer. He was not in uniform but in sports clothes;
[560] this meant that the place of the accident that I *now* feared had been taken by an *earlier*, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger – our funny little grandson; while the grey hair reminded me of

the latter's father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. – The locality in a store-closet and the cupboard from which he wanted to take something ('on which he wanted to put something' in the dream) – these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was more than two and not yet three years old.[1] I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: 'that serves you right'; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the *strength* of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish fulfilment of this kind in order to find some consolation.[2]

I am now in a position to give a precise account of the part played in dreams by the unconscious wish. I am ready to admit that there is a whole class of dreams the *instigation* to which arises principally or even exclusively from the residues of daytime life; and I think that even my wish that I might at long last become a *professor extraordinarius* might have allowed me to sleep through the night in peace if my worry over my friend's health had not still persisted from the previous day [p. 240 above]. But the worry alone could not have made a dream. The *driving force* which the dream required had to be provided by a wish; it was the [561]
business of the worry to get hold of a wish to act as the driving force of the dream.

The position may be explained by an analogy. A daytime thought may very well play the part of *entrepreneur* for a dream; but the entrepreneur, who, as people say, has the idea and the initiative to carry it out, can do nothing without capital; he needs a *capitalist* who can afford the outlay, and the capitalist who provides the psychical outlay for the dream is

1 [Cf. p. 15, footnote above.]

2 [This dream is discussed briefly in its possible telepathic aspect at the beginning of Freud's paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 189 f.]

invariably and indisputably, whatever may be the thoughts of the previous day, *a wish from the unconscious*.[1]

Sometimes the capitalist is himself the entrepreneur, and indeed in the case of dreams this is the commoner event: an unconscious wish is stirred up by daytime activity and proceeds to construct a dream. So, too, the other possible variations in the economic situation that I have taken as an analogy have their parallel in dream processes. The entrepreneur may himself make a small contribution to the capital; several entrepreneurs may apply to the same capitalist; several capitalists may combine to put up what is necessary for the entrepreneur. In the same way, we come across dreams that are supported by more than one dream wish; and so too with other similar variations, which could easily be run through, but which would be of no further interest to us. We must reserve until later what remains to be said of the dream wish.

The *tertium comparationis* [third element of comparison] in the analogy that I have just used – the quantity[2] put at the disposal of the entrepreneur in an appropriate amount – is capable of being applied in still greater detail to the purpose of elucidating the structure of dreams [*Traumstruktur*]. In most dreams it is possible to detect a central point which is marked by peculiar sensory intensity, as I have shown on pp. 272 [and 293 f. above]. This central point is as a rule the direct representation of the wish fulfilment, for, if we undo the displacements brought about by the dream-work, we find that the *psychical* intensity of the elements in the dream thoughts has been replaced by the *sensory* intensity of the
[562] elements in the content of the actual dream. The elements in the *neighbourhood* of the wish fulfilment often have nothing to do with its meaning, but turn out to be derivatives of distressing thoughts that run contrary to the wish. But owing to their being in what is often an artificially established connection with the central element, they have acquired enough intensity to become capable of being represented in the dream. Thus the wish fulfilment's power of bringing about representation is diffused over a certain sphere surrounding it, within which all the elements – including even those possessing no means of their own – become empowered to obtain representation. In the case of dreams that are actuated by *several* wishes, it is easy to delimit the spheres of the different

1 [These last two paragraphs are quoted in full by Freud at the end of his analysis of 'Dora's' first dream (1905*e*), *RSE*, 7, 77, which, he comments, is a complete confirmation of their correctness.]

2 [Of capital in the case of the analogy, and of psychical energy in the case of a dream.]

wish fulfilments, and gaps in the dream may often be understood as frontier zones between those spheres.[1]

Though the preceding considerations have reduced the importance of the part played by the day's residues in dreams, it is worthwhile devoting a little more attention to them. It must be that they are essential ingredients in the formation of dreams, since experience has revealed the surprising fact that in the content of every dream some link with a recent daytime impression – often of the most insignificant sort – is to be detected. We have not hitherto been able to explain the necessity for this addition to the mixture that constitutes a dream (see p. 160). And it is only possible to do so if we bear firmly in mind the part played by the unconscious wish and then seek for information from the psychology of the neuroses. We learn from the latter that an unconscious idea is as such quite incapable of entering the preconscious and that it can only exercise any effect there by establishing a connection with an idea which already belongs to the preconscious, by transferring its intensity on to it and by getting itself 'covered' [*decken*][T] by it. Here we have the fact of 'transference',[2] which provides an explanation of so many striking phenomena in the mental life of neurotics. The preconscious idea, which thus acquires an undeserved degree of intensity, may either be left unaltered by the transference, or it may have a modification forced upon it, derived from the content of the idea which effects the transference. I hope I may be forgiven for drawing analogies from everyday life, but I am tempted to say that the position of a repressed idea resembles that of an American dentist in this country: he is not allowed to set up in practice unless he can make use of a legally qualified medical practitioner to serve as a stalking-horse and to act as a 'cover' in the eyes of the law. And just as it is not exactly the physicians with the largest practices who form alliances of this kind with dentists, so in the same way preconscious or conscious ideas which have already attracted a sufficient amount of the attention that is operating in the preconscious will not be the ones to be chosen to act as covers for a repressed idea. The unconscious prefers to

[563]

1 [A particularly clear summary of the part played by the 'day's residues' in the construction of dreams can be found in the course of Freud's short paper, 1913*a*; *RSE*, **12**, 271 f.]

2 [In his later writings Freud regularly used this same word 'transference' ('*Übertragung*') to describe a somewhat different, though not unrelated, psychological process, first discovered by him as occurring in the course of psychoanalytic treatment – namely, the process of 'transferring' on to a contemporary object feelings which originally applied, and still unconsciously apply, to an infantile object. (See, e.g., Freud, 1905*e*, Section IV; ibid., **7**, 102 ff.; and Freud, 1915*a*; ibid., **12**, 159 ff.) The word occurs also in this other sense in the present volume – e.g. on pp. 163 and 176 above – and had already been so used by Freud in Chapter IV of *Studies on Hysteria* (Breuer & Freud, 1895*d*).]

weave its connections round preconscious impressions and ideas which are either indifferent and have thus had no attention paid to them, or have been rejected and have thus had attention promptly withdrawn from them. It is a familiar article in the doctrine of association, and one that is entirely confirmed by experience, that an idea which is bound by a very intimate tie in one direction, tends, as it were, to repel whole groups of new ties. I once attempted to base a theory of hysterical paralyses on this proposition.[1]

If we assume that the same need for transference on the part of repressed ideas which we have discovered in analysing the neuroses is also at work in dreams, two of the riddles of the dream are solved at a blow: the fact, namely, that every analysis of a dream shows some recent impression woven into its texture and that this recent element is often of the most trivial kind [p. 159 f. above]. I may add that (as we have already found elsewhere [p. 157]) the reason why these recent and indifferent elements so frequently find their way into dreams as substitutes for the most ancient of all the dream thoughts is that they have least to fear from the
[564] censorship imposed by resistance. But while the fact that *trivial* elements are preferred is explained by their freedom from censorship, the fact that *recent* elements occur with such regularity points to the existence of a need for transference. Both groups of impressions satisfy the demand of the repressed for material that is still clear of associations – the indifferent ones because they have given no occasion for the formation of many ties, and the recent ones because they have not yet had time to form them.

It will be seen, then, that the day's residues, among which we may now class the indifferent impressions, not only *borrow* something from the *Ucs*. when they succeed in taking a share in the formation of a dream – namely the driving force which is at the disposal of the repressed wish – but that they also *offer* the unconscious something indispensable – namely, the necessary point of attachment for a transference. If we wished to penetrate more deeply at this point into the processes of the mind, we should have to throw more light upon the interplay of excitations between the preconscious and the unconscious – a subject towards which the study of the psychoneuroses draws us, but upon which, as it happens, dreams have no help to offer.

I have only one thing more to add about the day's residues. There can be no doubt that it is they that are the true disturbers of sleep and not dreams, which, on the contrary, are concerned to guard it. I shall return to this point later. [See p. 516 ff.]

1 [See Section IV of Freud (1893*c*), *RSE*, **1**, 197 f.]

We have so far been studying dream wishes: we have traced them from their origin in the region of the *Ucs*. and have analysed their relations to the day's residues, which in their turn may either be wishes or psychical impulses of some other kind or simply recent impressions. In this way we have allowed room for every claim that may be raised by any of the multifarious waking thought activities on behalf of the importance of the part played by them in the process of constructing dreams. It is not impossible, even, that our account may have provided an explanation of the extreme cases in which a dream, pursuing the activities of daytime, arrives at a happy solution to some unsolved problem of waking life.[1] All we need is an example of this kind, so that we might analyse it and trace the source of the infantile or repressed wishes whose help has been enlisted and has reinforced the efforts of preconscious activity with such [565] success. But all this has not brought us a step nearer to solving the riddle of why it is that the unconscious has nothing else to offer during sleep but the driving force for the fulfilment of a *wish*. The answer to this question must throw light upon the psychical nature of wishes, and I propose to give the answer by reference to our schematic picture of the psychical apparatus.

There can be no doubt that that apparatus has only reached its present perfection after a long period of development. Let us attempt to carry it back to an earlier stage of its functioning capacity. Hypotheses, whose justification must be looked for in other directions, tell us that at first the apparatus's efforts were directed towards keeping itself so far as possible free from stimuli;[2] consequently its first structure followed the plan of a reflex apparatus, so that any sensory excitation impinging on it could be promptly discharged along a motor path. But the exigencies of life interfere with this simple function, and it is to them, too, that the apparatus owes the impetus to further development. The exigencies of life confront it first in the form of the major somatic needs. The excitations produced by internal needs seek discharge [*Abfluss*][T] in movement, which may be described as an 'internal change' or an 'expression of emotion'. A hungry baby screams or kicks helplessly. But the situation remains unaltered, for the excitation arising from an internal need is not due to a

1 [See above, p. 57. An instance of this is mentioned in a footnote in Section II of *The Ego and the Id* (Freud, 1923*b*), *RSE*, **19**, 23 *n*. 1.]

2 [This is the so-called 'principle of constancy' which is discussed in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 9 f. But it was already a fundamental assumption in some of Freud's earliest psychological writings, e.g. in his posthumously published 'Letter to Josef Breuer' of June 29, 1892 (Freud, 1941*a*), ibid., **1**, 175. The whole gist of the present paragraph is already stated in Sections 1, 2, 11 and 16 of Part I of his 'Project for a Scientific Psychology' written in the autumn of 1895 (Freud, 1950*a*). Cf. Editors' Introduction, p. xix f. above.]

force producing a *momentary* impact but to one which is in continuous operation. A change can only come about if in some way or other (in the case of the baby, through outside help) an 'experience of satisfaction' [*Befriedigungserlebnisses*] can be achieved which puts an end to the internal stimulus. An essential component of this experience of satisfaction is a particular perception (that of nourishment, in our example) the mnemic image of which remains associated thenceforward with the memory trace of the excitation produced by the need. As a result of the link that
[566] has thus been established, next time this need arises a psychical impulse will at once emerge which will seek to recathect the mnemic image of the perception and to re-evoke the perception itself, that is to say, to re-establish the situation of the original satisfaction. An impulse of this kind is what we call a wish; the reappearance of the perception is the fulfilment of the wish; and the shortest path to the fulfilment of the wish is a path leading direct from the excitation produced by the need to a complete cathexis [*Besetzung*] of the perception. Nothing prevents us from assuming that there was a primitive state of the psychical apparatus in which this path was actually traversed, that is, in which wishing ended in hallucinating. Thus the aim of this first psychical activity was to produce a 'perceptual identity'[1] [*Wahrnehmungsidentität*][T] – a repetition of the perception which was linked with the satisfaction of the need.

The bitter experience of life must have changed this primitive thought activity into a more expedient secondary one. The establishment of a perceptual identity along the short path of regression within the apparatus does not have the same result elsewhere in the mind as does the cathexis of the same perception from without. Satisfaction does not follow; the need persists. An internal cathexis could only have the same value as an external one if it were maintained unceasingly, as, in fact, occurs in hallucinatory psychoses and hunger phantasies, which exhaust their whole psychical activity in clinging to the object of their wish. In order to arrive at a more efficient expenditure of psychical force, it is necessary to bring the regression to a halt before it becomes complete, so that it does not proceed beyond the mnemic image, and is able to seek out other paths which lead eventually to the desired perceptual identity being established from the direction of the external world.[2] This inhibition of the regression and the subsequent diversion of the excitation become the business of a second system, which is in control of

1 [I.e. something perceptually identical to the 'experience of satisfaction'.]

2 [*Footnote added* 1919:] In other words, it becomes evident that there must be a means of 'reality-testing' [*Realitätsprüfung*; i.e. of testing things to see whether or not they are real].

voluntary movement – which for the first time, that is, makes use of movement for purposes remembered in advance. But all the complicated thought activity which is spun out from the mnemic image to the moment at which the perceptual identity is established by the external world – all [567] this activity of thought merely constitutes a roundabout path to wish fulfilment which has been made necessary by experience.[1] Thought is after all nothing but a substitute for a hallucinatory wish; and it is self-evident that dreams must be wish fulfilments, since nothing but a wish can set our mental apparatus at work. Dreams, which fulfil their wishes along the short path of regression, have merely preserved for us in that respect a sample of the psychical apparatus's primary method of working, a method which was abandoned as being inefficient. What once dominated waking life, while the mind was still young and incompetent, seems now to have been banished into the night – just as the primitive weapons, the bows and arrows, that have been abandoned by adult men, turn up once more in the nursery. *Dreaming is a piece of infantile mental life that has been superseded*. These methods of working on the part of the psychical apparatus, which are normally suppressed in waking hours, become current once more in psychosis and then reveal their incapacity for satisfying our needs in relation to the external world.[2]

The unconscious wishful impulses clearly try to make themselves effective in daytime as well, and the fact of transference, as well as the psychoses, show us that they endeavour to force their way by way of the preconscious system into consciousness and to obtain control of the power of movement. Thus the censorship between the *Ucs*. and the *Pcs*., the assumption of whose existence is positively forced upon us by dreams, deserves to be recognized and respected as the watchman of our mental health. Must we not regard it, however, as an act of carelessness on the part of that watchman that it relaxes its activities during the night, allows the suppressed impulses in the *Ucs*. to find expression, and makes it possible for hallucinatory regression to occur once more? I think not. For [568] even though this critical watchman goes to rest – and we have proof that its slumbers are not deep – it also shuts the door upon the power of

1 The wish-fulfilling activity of dreams is justly extolled by Le Lorrain [1895], who speaks of it as 'sans fatigue sérieuse, sans être obligé de recourir à cette lutte opiniâtre et longue qui use et corrode les jouissances poursuivies [incurring no serious fatigue and not being obliged to embark upon the long and obstinate struggle that wears away and spoils enjoyments that have to be pursued]'.

2 [*Footnote added* 1914:] I have elsewhere carried this train of thought further in a paper on the two principles of mental functioning (Freud, 1911*b*) [*RSE*, **12**, 215 f.] – the pleasure principle and the reality principle, as I have proposed calling them. [The argument is, in fact, developed further below, on p. 535 ff.]

movement. No matter what impulses from the normally inhibited *Ucs.* may prance upon the stage, we need feel no concern; they remain harmless, since they are unable to set in motion the motor apparatus by which alone they might modify the external world. The state of sleep guarantees the security of the citadel that must be guarded. The position is less harmless when what brings about the displacement of forces is not the nightly relaxation in the critical censorship's output of force, but a pathological reduction in that force or a pathological intensification of the unconscious excitations while the preconscious is still cathected and the gateway to the power of movement stands open. When this is so, the watchman is overpowered, the unconscious excitations overwhelm the *Pcs.*, and thence obtain control over our speech and actions; or they forcibly bring about hallucinatory regression and direct the course of the apparatus (which was not designed for their use) by virtue of the attraction exercised by perceptions on the distribution of our psychical energy. To this state of things we give the name of psychosis.

We are now well on the way to proceeding further with the erection of the psychological scaffolding, which we stopped at the point at which we introduced the two systems *Ucs.* and *Pcs.* But there are reasons for continuing a little with our consideration of wishes as the sole psychical driving force for the construction of dreams. We have accepted the idea that the reason why dreams are invariably wish fulfilments is that they are products of the system *Ucs.*, whose activity knows no other aim than the fulfilment of wishes and which has at its command no other forces than wishful impulses. If we insist, for even a moment longer, upon our right to base such far-reaching psychological speculations upon the interpretation of dreams, we are in duty bound to prove that those speculations have enabled us to insert dreams into a nexus which can include other psychical structures as well. If such a thing as a system *Ucs.* exists (or something analogous to it for the purposes of our discussion), dreams cannot be its only manifestation; every dream may be a wish fulfilment,
[569] but apart from dreams there must be other forms of abnormal wish fulfilments. And it is a fact that the theory governing all psychoneurotic symptoms culminates in a single proposition, which asserts that *they too are to be regarded as fulfilments of unconscious wishes*.[1] Our explanation makes the dream only the first member of a class which is of the greatest

1 [*Footnote added* 1914:] Or more correctly, one portion of the symptom corresponds to the unconscious wish fulfilment and another portion to the mental structure reacting against the wish.

significance to psychiatrists and an understanding of which implies the solution to the purely psychological side of the problem of psychiatry.[1]

The other members of this class of wish fulfilments – hysterical symptoms, for instance – possess one essential characteristic, however, which I cannot discover in dreams. I have learnt from the researches which I have mentioned so often in the course of this work that in order to bring about the formation of a hysterical symptom *both* currents of our mind must converge. A symptom is not merely the expression of a realized unconscious wish; a wish from the preconscious which is fulfilled by the same symptom must also be present. So that the symptom will have *at least* two determinants, one arising from each of the systems involved in the conflict. As in the case of dreams, there are no limits to the further determinants that may be present – to the 'overdetermination' of the symptoms.[2] The determinant which does not arise from the *Ucs*. is invariably, so far as I know, a train of thought reacting against the unconscious wish – a self-punishment, for instance. I can therefore make the quite general assertion that *a hysterical symptom develops only where the fulfilments of two opposing wishes, arising each from a different psychical system, are able to converge in a single expression*. (Compare in this connection my most recent formulations on the origin of hysterical symptoms in my paper on hysterical phantasies and their relation to bisexuality. [Freud, 1908*a*; *RSE*, **9**, 137 ff.][3]) Examples would serve very little purpose here, since nothing but an exhaustive elucidation of the complications involved could carry conviction. I will therefore leave my assertion to [570]
stand for itself and only quote an example in order to make the point clear, and not to carry conviction. In one of my women patients, then, hysterical vomiting turned out to be on the one hand the fulfilment of an unconscious phantasy dating from her puberty – of a wish, that is, that she might be continuously pregnant and have innumerable children, with a further wish, added later, that she might have them by as many men as possible. A powerful defensive impulse had sprung up against this unbridled wish. And, since the patient might lose her figure and her good looks as a result of her vomiting, and so might cease to be attractive to anyone, the symptom was acceptable to the punitive train of thought as well; and since it was permitted by both sides it could become a reality. This was the same method of treating a wish fulfilment as was adopted

1 [*Footnote added* 1914:] As Hughlings Jackson said: 'Find out all about dreams and you will have found out all about insanity.' [Quoted by Ernest Jones (1911*c*), who had heard it at first hand from Hughlings Jackson.]

2 [Cf. Freud in Breuer & Freud (1895*d*), Chapter IV, Section 1, Observation 3; *RSE*, **2**, 233–4.]

3 [This sentence was added in 1909.]

by the Parthian queen towards the Roman triumvir Crassus. Believing that he had embarked on his expedition out of love of gold, she ordered molten gold to be poured down his throat when he was dead: 'Now', she said, 'you have what you wanted.' But all that we so far know about dreams is that they express the fulfilment of a wish from the unconscious; it seems as though the dominant, preconscious system acquiesces in this after insisting upon a certain number of distortions. Nor is it possible as a general rule to find a train of thought opposed to the dream wish and, like its counterpart, realized in the dream. Only here and there in dream analyses do we come upon signs of reactive creations, like, for instance, my affectionate feelings for my friend R. in the dream of my uncle [with the yellow beard] (cf. p. 124 ff.). But we can find the missing ingredient from the preconscious elsewhere. Whereas the wish from the *Ucs*. is able to find expression in the dream after undergoing distortions of every kind, the dominant system withdraws into a *wish to sleep*, realizes that wish by bringing about the modifications which it is able to produce in the cathexes within the psychical apparatus, and persists in that wish throughout the whole duration of sleep.[1]

This determined wish on the part of the preconscious to sleep exercises a generally facilitating effect on the formation of dreams. Let me
[571] recall the dream dreamt by the man who was led to infer from the glare of light coming out of the next room that his child's body might be on fire [p. 455 ff. above]. The father drew this inference in a dream instead of allowing himself to be woken up by the glare; and we have suggested that one of the psychical forces responsible for this result was a wish which prolonged by that one moment the life of the child whom he pictured in the dream. Other wishes, originating from the repressed, probably escape us, since we are unable to analyse the dream. But we may assume that a further driving force in the production of the dream was the father's need to sleep; his sleep, like the child's life, was prolonged by one moment by the dream. 'Let the dream go on' – such was his motive – 'or I shall have to wake up.' In every other dream, just as in this one, the wish to sleep lends its support to the unconscious wish. On p. 110 ff. I described some dreams which appeared openly as dreams of convenience. But in fact all dreams can claim a right to the same description. The operation of the wish to continue sleeping is most easily to be seen in arousal dreams, which modify external sensory stimuli in such a way as to make them compatible with a continuance of sleep;

1 I have borrowed this idea from the theory of sleep put forward by Liébeault (1889), to whom is due the revival in modern times of research into hypnotism.

they weave them into a dream in order to deprive them of any possibility of acting as reminders of the external world. That same wish must, however, play an equal part in allowing the occurrence of all other dreams, though it may only be from *within* that they threaten to shake the subject out of his sleep. In some cases, when a dream carries things too far, the *Pcs*. says to consciousness: 'Never mind! go on sleeping! after all it's only a dream!' [See p. 437 f. above.] But this describes in general the attitude of our dominant mental activity towards dreams, though it may not be openly expressed. I am driven to conclude that *throughout our whole sleeping state we know just as certainly that we are dreaming as we know that we are sleeping*. We must not pay too much attention to the counterargument that our consciousness is never brought to bear on the latter piece of knowledge and that it is only brought to bear on the former on particular occasions when the censorship feels that it has, as it were, been taken off its guard.

On the other hand,[1] there are some people who are quite clearly aware during the night that they are asleep and dreaming and who thus seem to possess the faculty of consciously directing their dreams. If, for instance, a dreamer of this kind is dissatisfied with the turn taken by a dream, he [572]
can break it off without waking up and start it again in another direction – just as a popular dramatist may under pressure give his play a happier ending. Or another time, if his dream has led him into a sexually exciting situation, he can think to himself: 'I won't go on with this dream any further and exhaust myself with an emission; I'll hold it back for a real situation instead.'

The Marquis d'Hervey de Saint-Denys [1867, 268 ff.],[2] quoted by Vaschide (1911, 139), claimed to have acquired the power of accelerating the course of his dreams just as he pleased, and of giving them any direction he chose. It seems as though in his case the wish to sleep had given place to another preconscious wish, namely to observe his dreams and enjoy them. Sleep is just as compatible with a wish of this sort as it is with a mental reservation to wake up if some particular condition is fulfilled (e.g. in the case of a nursing mother or wet-nurse) [p. 198]. Moreover, it is a familiar fact that anyone who takes an interest in dreams remembers a considerably greater number of them after waking.

Ferenczi (1911*a*),[3] in the course of a discussion of some other observations upon the directing of dreams, remarks: 'Dreams work over

1 [This paragraph was added in 1909.]

2 [This paragraph was added in 1914.]

3 [This paragraph was added as a footnote in 1914 and included in the text in 1930.]

the thoughts which are occupying the mind at the moment from every angle; they will drop a dream image if it threatens the success of a wish fulfilment and will experiment with a fresh solution, till at last they succeed in constructing a wish fulfilment which satisfies both agencies of the mind as a compromise.'

(D)
AROUSAL BY DREAMS — THE FUNCTION OF DREAMS — ANXIETY DREAMS

Now that we know that all through the night the preconscious is concentrated upon the wish to sleep, we are in a position to carry our understanding of the process of dreaming a stage further. But first let us summarize what we have learnt so far. [573]

The situation is this. Either residues of the previous day have been left over from the activity of waking life and it has not been possible to withdraw the whole cathexis of energy from them; or the activity of waking life during the course of the day has led to the stirring up of an unconscious wish; or these two events have happened to coincide. (We have already discussed the various possibilities in this connection.) The unconscious wish links itself up with the day's residues and effects a transference [*Übertragung*] on to them; this may happen either in the course of the day or not until a state of sleep has been established. A wish now arises which has been transferred on to the recent material; or a recent wish, having been suppressed, gains fresh life by being reinforced from the unconscious. This wish seeks to force its way along the normal path taken by thought processes, through the *Pcs*. (to which, indeed, it in part belongs) to consciousness. But it comes up against the censorship, which is still functioning and to the influence of which it now submits. At this point it takes on the distortion for which the way has already been paved by the transference of the wish on to the recent material. So far it is on the way to becoming an obsessive idea [*Zwangsvorstellung*] or a delusion [*Wahnidee*] or something of the kind – that is, *a thought* which has been intensified by transference and distorted in its expression by censorship. Its further advance is halted, however, by the sleeping state of the preconscious. (The probability is that that system has protected itself against the invasion by diminishing its own excitations.) The dream process consequently enters on a regressive path, which lies open to it precisely owing to the peculiar nature of the state of sleep, and it is led along that path by the attraction exercised on it by groups of memories; some of these memories themselves exist only in the form of visual [574] cathexes and not as translations into the terminology of the later systems. [Cf. p. 488 above.] In the course of its regressive path the dream process acquires the attribute of representability. (I shall deal later with

the question of compression [p. 532 f. below].) It has now completed the second portion of its zigzag journey. The first portion was a progressive one, leading from the unconscious scenes or phantasies to the preconscious; the second portion led from the frontier of the censorship back again to perceptions. But when the content of the dream process has become perceptual, by that fact it has, as it were, found a way of evading the obstacle put in its way by the censorship and the state of sleep in the *Pcs*. [Cf. p. 470 f.] It succeeds in drawing attention to itself and in being noticed by consciousness.

For consciousness, which we look upon in the light of a sense organ for the apprehension of psychical qualities, is capable in waking life of receiving excitations from two directions. In the first place, it can receive excitations from the periphery of the whole apparatus, the perceptual system; and in addition to this, it can receive excitations of pleasure and
Lust unpleasure [*Lust- und Unlusterregungen*]^{T}, which prove to be almost the only psychical quality attaching to transpositions of energy in the inside of the apparatus.[1] All other processes in the ψ-systems, including the *Pcs*., are lacking in any psychical quality and so cannot be objects of consciousness, except insofar as they bring pleasure or unpleasure to perception. We are thus driven to conclude that *these releases of pleasure and unpleasure automatically regulate the course* [*Ablauf*] *of cathectic processes*. But, in order to make more delicately adjusted performances possible, it later became necessary to make the course of ideas less dependent upon the presence or absence of unpleasure. For this purpose the *Pcs*. system needed to have qualities of its own which could attract consciousness; and it seems highly probable that it obtained them by linking the preconscious processes with the mnemic system of indications of speech, a system not without quality. [See pp. 545 *n*. 1 and 551 f.] By means of the qualities of that system, consciousness, which had hitherto been a sense organ for perceptions alone, also became a sense organ for a portion of our thought processes. Now, therefore, there are, as it were, *two* sensory surfaces, one directed towards perception and the other towards the preconscious thought processes.

[575] I must assume that the state of sleep makes the sensory surface of consciousness which is directed towards the *Pcs*. far more insusceptible to excitation than the surface directed towards the *Pcpt*. systems. Moreover, this abandonment of interest in thought processes during the night has a purpose: thinking is to come to a standstill, for the *Pcs*. requires sleep. Once, however, a dream has become a *perception*, it is in a position to

1 [See *RSE*, **1**, 313 f. *n*. 2.]

excite consciousness, by means of the qualities it has now acquired. This sensory excitation proceeds to perform what is its essential function: it directs a part of the available cathectic energy in the *Pcs*. into attention to what is causing the excitation. [See p. 530 f. below.] It must therefore be admitted that every dream has an *arousing* effect, that it sets a part of the quiescent force of the *Pcs*. in action. The dream is then submitted by this force to the influence which we have described as secondary revision with an eye to consecutiveness and intelligibility. That is to say, the dream is treated by it just like any other perceptual content; it is met with the same anticipatory ideas, insofar as its subject matter allows [p. 447]. So far as this third portion of the dream process has any direction it is once again a progressive one.

To avoid misunderstandings, a word about the chronological relations of these dream processes will not be out of place. A very attractive conjecture has been put forward by Goblot [1896, 289 f.], suggested, no doubt, by the riddle of Maury's guillotine dream [p. 24 above]. He seeks to show that a dream occupies no more than the transition period between sleeping and waking. The process of awakening takes a certain amount of time, and during that time the dream occurs. We imagine that the final dream image was so powerful that it compelled us to wake; whereas in fact it was only so powerful because at that moment we were already on the point of waking. 'Un rêve c'est un réveil qui commence.'[1]

It has already been pointed out by Dugas [1897*b*] that Goblot would have to disregard many facts before he could assert his thesis generally. Dreams occur from which we do not awaken – for instance, some in which we dream that we are dreaming. With our knowledge of the dream-work, we could not possibly agree that it covers only the period of awakening. It seems probable, on the contrary, that the first portion of the dream-work has already begun during the day, under the control of the preconscious. [576]
Its second portion – the modification imposed by the censorship, the attraction exercised by unconscious scenes, and the forcing of its way to perception – no doubt proceeds all through the night; and in this respect we may perhaps always be right when we express a feeling of having been dreaming all night long, though we cannot say what. [See p. 462.]

But it seems to me unnecessary to suppose that dream processes really maintain, up to the moment of becoming conscious, the chronological order in which I have described them: that the first thing to appear is the transferred dream wish, that distortion by the censorship follows, then the regressive change in direction, and so on. I have been

1 ['A dream is an awakening that is beginning.']

obliged to adopt this order in my description; but what happens in reality is no doubt a simultaneous exploring of one path and another, a swinging of the excitation now this way and now that, until at last it accumulates in the direction that is most opportune and one particular grouping becomes the permanent one. Certain personal experiences of my own lead me to suspect that the dream-work often requires more than a day and a night in order to achieve its result; and if this is so, we need no longer feel any amazement at the extraordinary ingenuity shown in the construction of the dream. In my opinion even the demand for the dream to be made intelligible as a perceptual event may be put into effect before the dream attracts consciousness to itself. From then onwards, however, the pace is accelerated, for at that point a dream is treated in the same fashion as anything else that is perceived. It is like a firework, which takes hours to prepare but goes off in a moment.

The dream process has by now either acquired sufficient intensity through the dream-work to attract consciousness to itself and arouse the preconscious, irrespectively of the time and depth of sleep; or its intensity is insufficient to achieve this and it must remain in a state of readiness until, just before waking, attention becomes more mobile and comes to meet it. The majority of dreams appear to operate with comparatively low psychical intensities, for they mostly wait until the moment of waking. But this also explains the fact that, if we are suddenly woken from deep sleep, we usually perceive something that we have dreamt. In such cases, just as when we wake of our own accord, the first thing we see is the perceptual content that has been constructed by the dream-work and
[577] immediately afterwards we see the perceptual content that is offered to us from outside ourselves.

Greater theoretical interest, however, attaches to the dreams which have the power to rouse us in the middle of our sleep. Bearing in mind the expediency which is everywhere else the rule, we may ask why a dream, that is, an unconscious wish, is given the power to interfere with sleep, that is, with the fulfilment of the preconscious wish. The explanation no doubt lies in relations of energy of which we have no knowledge. If we possessed such knowledge, we should probably find that allowing the dream to take its course and expending a certain amount of more or less detached attention on it is an economy of energy compared with holding the unconscious as tightly under control at night as in the daytime. [Cf. p. 518 below.] Experience shows that dreaming is compatible with sleeping, even if it interrupts sleep several times during the night. One wakes up for an instant and then falls asleep again at once. It is like

brushing away a fly in one's sleep: a case of *ad hoc* awakening. If one falls asleep again, the interruption has been disposed of. As is shown by such familiar examples as the sleep of a nursing mother or wet-nurse [p. 198], the fulfilment of the wish to sleep is quite compatible with maintaining a certain expenditure of attention in some particular direction.

At this point an objection arises, which is based on a better knowledge of unconscious processes. I myself have asserted that unconscious wishes are always active. But in spite of this they seem not to be strong enough to make themselves perceptible during the day. If, however, while a state of sleep prevails, an unconscious wish has shown itself strong enough to construct a dream and arouse the preconscious with it, why should this strength fail after the dream has been brought to knowledge? Should not the dream continue to recur perpetually, precisely as the vexatious fly keeps on coming back after it has been driven away? What right have we to assert that dreams get rid of the disturbance of sleep?

It is perfectly true that unconscious wishes always remain active. They represent paths which can always be traversed, whenever a quantity of excitation makes use of them. [Cf. p. 494 f. *n*. above.] Indeed it is a prominent feature of unconscious processes that they are indestructible. In the unconscious nothing can be brought to an end, nothing is past or forgotten. This is brought most vividly home to one in studying the neuroses, [578]
and especially hysteria. The unconscious path of thoughts, which leads to discharge in a hysterical attack, immediately becomes traversable once more, when sufficient excitation has accumulated. A humiliation that was experienced thirty years ago acts exactly like a fresh one throughout the thirty years, as soon as it has obtained access to the unconscious sources of emotion. As soon as the memory of it is touched, it springs into life again and shows itself cathected with excitation which finds a motor discharge in an attack. This is precisely the point at which psychotherapy has to intervene. Its task is to make it possible for the unconscious processes to be dealt with finally and be forgotten. For the fading of memories and the emotional weakness of impressions which are no longer recent, which we are inclined to regard as self-evident and to explain as a primary effect of time upon mental memory traces, are in reality secondary modifications which are only brought about by laborious work. What performs this work is the preconscious, and *psychotherapy can pursue no other course than to bring the Ucs. under the domination of the Pcs*.[1]

1 [The last clause of this sentence was printed in spaced type only from 1919 onwards. Cf. p. 494 f. *n*. above.]

Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being *discharged*, may be *bound* by the preconscious. *This second alternative is the one which occurs in the process of dreaming.* [See p. 538 *n*. below.] The cathexis from the *Pcs*. which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really *has* brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually *is* more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious
[579] work – rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. [Cf. p. 516 f.] It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the *Ucs*. which has been left free; in so doing, it discharges the *Ucs*. excitation, serves it as a safety-valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise; it is in the service of both of the two systems, since it fulfils the two wishes insofar as they are compatible with each other. If we turn back to the 'excretion theory' of dreams put forward by Robert [1886], which I explained on p. 69 ff., we shall see at a glance that in its essence we must accept his account of the *function* of dreams, though differing from him in his premises and in his view of the dream process itself. [See p. 157 f.][1]

1 [*Footnote added* 1914:] Is this the only function that can be assigned to dreams? I know of no other. It is true that Maeder [1912] has attempted to show that dreams have other, 'secondary', functions. He started out from the correct observation that some dreams contain attempts at solving conflicts, attempts which are later carried out in reality and which thus behave as though they were trial practices for waking actions. He therefore drew a parallel between dreams and the play of animals and children, which may be regarded as practice in the operation of innate instincts [*Instinkte*][T] and as preparation for serious activity later on, and put forward the hypothesis that dreams have a '*fonction ludique*' ['play function']. Shortly before Maeder, Alfred Adler [1911*b*, 215 *n*.], too, had insisted that dreams possessed a function of 'thinking ahead'. (In an analysis which I published in 1905 ['Fragment of an Analysis of a Case of Hysteria', Section II (1905*e*); *RSE*, 7, 81–3], a dream, which could only be regarded as expressing an intention, was repeated every night until it was carried out. [Cf. above, p. 168.])

The qualification 'insofar as the two wishes are compatible with each other' implies a hint at the possible case in which the function of dreaming may come to grief. The dream process is allowed to begin as a fulfilment of an unconscious wish; but if this attempted wish fulfilment jars upon the preconscious so violently that it is unable to continue sleeping, then the dream has made a breach in the compromise and has failed to carry out the second half of its task. In that case the dream is immediately broken off and replaced by a state of complete waking. Here again it is not really the fault of the dream if it has now to appear in the role of a *disturber* of sleep instead of in its normal one of a *guardian* of sleep; and this fact need not prejudice us against its having a useful purpose. This is not the only instance in the organism of a contrivance which is normally useful becoming useless and disturbing as soon as the conditions that give rise to it are somewhat modified; and the disturbance at least serves the new purpose of drawing attention to the modification and of setting the organism's regulative machinery in motion against it. What I have in mind is of course the case of anxiety dreams, and in order that I may not be thought to be evading this evidence against the theory of wish fulfilment whenever I come across it, I will at all events give some hints of their explanation. [580]

There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the *Ucs*., while it has been repudiated and suppressed by the other system, the *Pcs*.[1] Even where psychical health is

A little reflection will convince us, however, that this 'secondary' function of dreams has no claim to be considered as a part of the subject of dream interpretation. Thinking ahead, forming intentions, framing attempted solutions which may perhaps be realized later in waking life, all these, and many other similar things, are products of the unconscious and preconscious activity of the mind; they may persist in the state of sleep as 'the day's residues' and combine with an unconscious wish (cf. p. 492 ff.) in forming a dream. Thus the dream's function of 'thinking ahead' is rather a function of preconscious waking thought, the products of which may be revealed to us by the analysis of dreams or of other phenomena. It has long been the habit to regard dreams as identical to their manifest content; but we must now beware equally of the mistake of confusing dreams with latent dream thoughts. [Cf. p. 453 *n*. 2 above and the discussion of Case I in Freud's paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 199.]

1 [*Footnote added* 1919:] 'A second factor, which is much more important and far-reaching, but which is equally overlooked by laymen is the following. No doubt a wish fulfilment must bring pleasure; but the question then arises "To whom?" To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them – he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream wishes can only be compared to an amalgamation of two separate people who are linked by some strong element in common. Instead of enlarging on this, I will remind you of a familiar fairy tale [referred to above on p. 498] in which you will find the same situation repeated. A good fairy promised a

[581] perfect, the subjugation of the *Ucs*. by the *Pcs*. is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the *Ucs*. an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand, they make it possible for the *Pcs*. to control the *Ucs*. to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone – a condition which we rightly regard as a 'symptom'. If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety [*Angst*][T]; and indeed the occurrence of an anxiety attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

[582] Our discussion cannot be carried any further without examining the part played by the affects in these processes; but we can only do so imperfectly in the present connection. Let us assume, then, that the suppression of the *Ucs*. is necessary above all because, if the course of ideas in the *Ucs*. were left to itself, it would generate an affect which was originally of a pleasurable nature, but became unpleasurable after the process of 'repression' occurred. The purpose, and the result too, of suppression is to prevent this release of unpleasure. The suppression extends over the ideational content of the *Ucs*., since the release of unpleasure might start from that content. This presupposes a quite specific assumption as to the nature of the generation of affect.[1] It is viewed as a motor or secretory function, the key to whose innervation lies in the ideas in the *Ucs*. Owing to the domination established by the

poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one – man and wife – the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.' (*Introductory Lectures on Psychoanalysis* [Freud, 1916–17*a*], Lecture XIV; *RSE*, **15**, 188–9.)

1 [For this assumption, cf. p. 418 f. and footnote above.]

Pcs. these ideas are, as it were, throttled, and inhibited from sending out impulses which would generate affect. If, therefore, the cathexis from the *Pcs*. ceases, the danger is that the unconscious excitations may release affect of a kind which (as a result of the repression which has already occurred) can only be experienced as unpleasure, as anxiety.

This danger materializes if the dream process is allowed to take its course. The conditions which determine its realization are that repressions must have occurred and that the suppressed wishful impulses shall be able to grow sufficiently strong. These determinants are thus quite outside the psychological framework of dream formation. If it were not for the fact that our topic is connected with the subject of the generation of anxiety by the single factor of the liberation of the *Ucs*. during sleep, I should be able to omit any discussion of anxiety dreams and avoid the necessity for entering in these pages into all the obscurities surrounding them.

The theory of anxiety dreams, as I have already repeatedly declared, forms part of the psychology of the neuroses.[1] We have nothing more to do with it when once we have indicated its point of contact with the topic of the dream process. There is only one thing more that I can do. Since I have asserted that neurotic anxiety arises from sexual sources, I can submit some anxiety dreams to analysis in order to show the sexual material present in their dream thoughts.[2] [583]

I have good reasons for leaving on one side in the present discussion the copious examples afforded by my neurotic patients, and for preferring to quote some anxiety dreams dreamt by young people.

It is dozens of years since I myself had a true anxiety dream. But I remember one from my seventh or eighth year, which I submitted to interpretation some thirty years later. It was a very vivid one, and in it I saw *my beloved mother, with a peculiarly peaceful, sleeping expression on her features, being carried into the room by two (or three) people with birds' beaks and laid upon the bed*. I awoke in tears and screaming, and interrupted my parents' sleep. The strangely draped and unnaturally tall figures with birds' beaks were derived from the illustrations to Philippson's Bible.[3] I fancy they must have been gods with

1 [The following sentence was added at this point in 1911, but omitted again in 1925 and subsequently: 'Anxiety in dreams, I should like to insist, is an anxiety problem and not a dream problem.']

2 [Some of the comments in what follows would require revision in the light of Freud's later views on anxiety. See also pp. 142 ff., 209 f. and 300 above.]

3 [*Die israelitische Bibel*, an edition of the Old Testament in Hebrew and German, Leipzig, 1839–54 (2nd ed. 1858). A footnote to the fourth chapter of Deuteronomy shows a number of woodcuts of Egyptian gods, several with birds' heads.]

sparrowhawks' heads [*Sperberköpfen*][1] from an ancient Egyptian funerary relief[t]. Besides this, the analysis brought to mind an ill-mannered boy, a son of a concierge, who used to play with us on the grass in front of the house when we were children, and who I am inclined to think was called Philipp. It seems to me that it was from this boy that I first heard the vulgar term for sexual intercourse, instead of which educated people always use a Latin word, 'to copulate', and which was clearly enough indicated by the choice of the sparrowhawks' heads.[2] I must have guessed the sexual significance of the word from the face of my young instructor, who was well acquainted with the facts of life. The expression on my mother's features in the dream was copied from the view I had had of my grandfather a few days before his death as he lay snoring in a coma. The interpretation carried out in the dream by the 'secondary revision' [p. 438 f. above] must therefore have been that my mother was dying; the funerary relief fitted in with this. I awoke in anxiety, which
[584] did not cease till I had woken my parents up. I remember that I suddenly grew calm when I saw my mother's face, as though I had needed to be reassured that she was not dead. But this 'secondary' interpretation of the dream had already been made under the influence of the anxiety which had developed. I was not anxious because I had dreamt that my mother was dying; but I interpreted the dream in that sense in my preconscious revision of it because I was already under the influence of the anxiety. The anxiety can be traced back, when repression is taken into account, to an obscure and evidently sexual craving that had found appropriate expression in the visual content of the dream.

A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that *a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot*. This is a good example of a very common sort of anxiety dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then

1 [Mistranslated 'falcons' heads' in the *SE*. The error was repeated seven lines down.]

2 [The German slang term referred to is '*vögeln*', from '*Vogel*', the ordinary word for 'bird'.]

passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often [585]
noticed blood in his mother's bed.

It is, I may say, a matter of daily experience that sexual intercourse between adults strikes any children who may observe it as something uncanny and that it arouses anxiety in them. I have explained this anxiety by arguing that what we are dealing with is a sexual excitation with which their understanding is unable to cope and which they also, no doubt, repudiate because their parents are involved in it, and which is therefore transformed into anxiety. At a still earlier period of life sexual excitations directed towards a parent of the opposite sex have not yet met with repression and, as we have seen, are freely expressed. (See p. 227 ff.)

I should have no hesitation in giving the same explanation of the attacks of night terrors accompanied by hallucinations (*pavor nocturnus*) which are so frequent in children. In this case too it can only be a question of sexual impulses which have not been understood and which have been repudiated. Investigation would probably show a periodicity in the occurrence of the attacks, since an increase in sexual libido can be brought about not only by accidental exciting impressions but also by successive waves of spontaneous developmental processes.

I lack a sufficiency of material based upon observation to enable me to confirm this explanation.[1]

Paediatricians, on the other hand, seem to lack the only line of approach which can make this whole class of phenomena intelligible, whether from the somatic or from the psychical aspect. I cannot resist

1 [*Footnote added* 1919:] Since I wrote this a great quantity of such material has been brought forward in psychoanalytic literature.

quoting an amusing instance of the way in which the blinkers of medical mythology can cause an observer to miss an understanding of such cases by a narrow margin. My instance is taken from a thesis on *pavor nocturnus* by Debacker (1881, 66):

A thirteen-year-old boy in delicate health began to be apprehensive and dreamy. His sleep became disturbed and was interrupted almost once a week by severe attacks of anxiety accompanied by hallucinations. He always retained a very clear recollection of these dreams. He said that the Devil had shouted at him: 'Now we've got you, now we've got you!' There was then a smell of pitch and brimstone and his skin was burnt by
[586] flames. He woke up from the dream in terror, and at first could not cry out. When he had found his voice he was clearly heard to say: 'No, no, not me; I've not done anything!' or 'Please not! I won't do it again!' or sometimes: 'Albert never did that!' Later, he refused to undress 'because the flames only caught him when he was undressed'. While he was still having these devil dreams, which were a threat to his health, he was sent into the country. There he recovered in the course of eighteen months, and once, when he was fifteen, he confessed: 'Je n'osais pas l'avouer, mais j'éprouvais continuellement des picotements et des surexcitations aux *parties*;[1] à la fin, cela m'énervait tant que plusieurs fois j'ai pensé me jeter par a fenêtre du dortoir.'[2]

There is really very little difficulty in inferring: (1) that the boy had masturbated when he was younger, that he had probably denied it, and that he had been threatened with severe punishment for his bad habit (cf. his admission: 'Je ne le ferais plus', and his denial: 'Albert n'a jamais fait ça'); (2) that with the onset of puberty the temptation to masturbate had revived with the tickling in his genitals; but (3) that a struggle for repression had broken out in him, which had suppressed his libido and transformed it into anxiety, and that the anxiety had retrospectively [*nachträglich*] taken over the punishments with which he had been threatened earlier.

And now let us see the inferences drawn by our author (ibid., 69): 'The following conclusions can be drawn from this observation:

'(1) The influence of puberty upon a boy in delicate health can lead to a condition of great weakness and can result in a *considerable degree of cerebral anaemia*.[3]

1 I have italicized this word, but it is impossible to misunderstand it.

2 ['I didn't dare admit it; but I was continually having prickly feelings and overexcitement in my parts; in the end it got on my nerves so much that I often thought of jumping out of the dormitory window.']

3 The italics are mine.

'(2) This cerebral anaemia produces character changes, demonomanic hallucinations and very violent nocturnal (and perhaps also diurnal) anxiety states.

'(3) The boy's demonomania and self-reproaches go back to the influences of his religious education, which affected him as a child.

'(4) All the symptoms disappeared in the course of a somewhat protracted visit to the country, as the result of physical exercise and the regaining of strength with the passage of puberty. [587]

'(5) A predisposing influence upon the origin of the child's brain condition may perhaps be attributed to heredity and to a past syphilitic infection in his father.'

And here is the final conclusion: 'Nous avons fait entrer cette observation dans le cadre des délires apyrétiques d'inanition, car c'est à l'ischémie cérébrale que nous rattachons cet état particulier.'[1]

1 ['We have classified this case among the apyretic deliria of inanition, for we attribute this particular state to cerebral ischaemia.']

(E)
THE PRIMARY AND SECONDARY PROCESSES — REPRESSION

[588] In venturing on an attempt to penetrate more deeply into the psychology of dream processes, I have set myself a hard task, and one to which my powers of exposition are scarcely equal. Elements in this complicated whole which are in fact simultaneous can only be represented successively in my description of them, while, in putting forward each point, I must avoid appearing to anticipate the grounds on which it is based: difficulties such as these it is beyond my strength to master. In all this I am paying the penalty for the fact that in my account of dream psychology I have been unable to follow the historical development of my own views. Though my own line of approach to the subject of dreams was determined by my previous work on the psychology of the neuroses, I had not intended to make use of the latter as a basis of reference in the present work. Nevertheless I am constantly being driven to do so, instead of proceeding, as I should have wished, in the contrary direction and using dreams as a means of approach to the psychology of the neuroses. I am conscious of all the trouble in which my readers are thus involved, but I can see no means of avoiding it. [See p. 93 *n*. above.]

In my dissatisfaction at this state of things, I am glad to pause for a little over another consideration which seems to put a higher value on my efforts. I found myself faced with a topic on which, as has been shown in my first chapter, the opinions of the authorities were characterized by the sharpest contradictions. My treatment of the problems of dreams has found room for the majority of these contradictory views. I have only found it necessary to give a categorical denial of two of them – the view that dreaming is a meaningless process [p. 49 ff.] and the view that it is a somatic one [p. 68 f.]. Apart from this, I have been able to find a justification for all these mutually contradictory opinions at one point or other of my complicated thesis and to show that they had lighted upon some portion of the truth.

[589] The view that dreams carry on the occupations and interests of waking life [p. 6 f.] has been entirely confirmed by the discovery of the concealed *dream thoughts*. These are only concerned with what seems important to us and interests us greatly. Dreams are never occupied with minor

details. But we have also found reason for accepting the contrary view, that dreams pick up indifferent refuse left over from the previous day [p. 16 ff. above] and that they cannot get control of any major daytime interest until it has been to some extent withdrawn from waking activity [p. 16]. We have found that this holds good of the dream's *content*, which gives expression to the dream thoughts in a form modified by distortion. For reasons connected with the mechanism of association, as we have seen, the dream process finds it easier to get control of recent or indifferent ideational material which has not yet been requisitioned by waking thought activity; and for reasons of censorship it transfers psychical intensity from what is important but objectionable on to what is indifferent.

The fact that dreams are hypermnesic [p. 10 ff.] and have access to material from childhood [p. 14 f.] has become one of the cornerstones of our teaching. Our theory of dreams regards wishes originating in infancy as the indispensable driving force for the formation of dreams.

It has naturally not occurred to us to throw any doubt on the significance, which has been experimentally demonstrated, of external sensory stimuli during sleep [p. 21 ff.]; but we have shown that such material stands in the same relation to the dream wish as do the residues of thought left over from daytime activity. Nor have we seen any reason to dispute the view that dreams interpret objective sensory stimuli just as illusions do [p. 26]; but we have found the motive which provides the reason for that interpretation, a reason which has been left unspecified by other writers. Interpretation is carried out in such a way that the object perceived shall not interrupt sleep and shall be usable for purposes of wish fulfilment. As regards subjective states of excitation in the sense organs during sleep, the occurrence of which seems to have been proved by Trumbull Ladd [1892; see above, p. 29 f.], it is true that we have not accepted them as a particular source of dreams; but we have been able to explain them as resulting from the regressive revival of memories that are in operation behind the dream.

Internal organic sensations, which have commonly been taken as a [590]
cardinal point in explanations of dreaming [p. 30 ff.], have retained a place, though a humbler one, in our theory. Such sensations – sensations of falling, for instance, or floating, or being inhibited – provide a material which is accessible at any time and of which the dream-work makes use, whenever it has need of it, for expressing the dream thoughts.

The view that the dream process is a rapid or instantaneous one [p. 57] is in our opinion correct as regards the perception by consciousness of

the preconstructed dream content; it seems probable that the preceding portions of the dream process run a slow and fluctuating course. We have been able to contribute towards the solution to the riddle of dreams which contain a great amount of material compressed into the briefest moment of time; we have suggested that it is a question in such cases of getting hold of ready-made structures already present in the mind.

The fact that dreams are distorted and mutilated by memory [p. 41 f. above] is accepted by us but in our opinion constitutes no obstacle; for it is no more than the last and manifest portion of a distorting activity which has been in operation from the very start of the dream's formation.

As regards the embittered and apparently irreconcilable dispute as to whether the mind sleeps at night [p. 48 f.] or is as much in command of all its faculties as it is by day [p. 53 f.], we have found that both parties are right but that neither is wholly right. We have found evidence in the dream thoughts of a highly complex intellectual function, operating with almost the whole resources of the mental apparatus. Nevertheless, it cannot be disputed that these dream thoughts originated during the day, and it is imperative to assume that there is such a thing as a sleeping state of the mind. Thus even the theory of partial sleep [p. 67 f.] has shown its value, though we have found that what characterizes the state of sleep is not the disintegration of mental bonds but the concentration of the psychical system which is in command during the day upon the wish to sleep. The factor of withdrawal from the external world [p. 6 f.] retains its significance in our scheme; it helps, though not as the sole determinant, to make possible the regressive character of representation in dreams. The renunciation of voluntary direction of the flow of ideas [p. 44 f.] cannot be disputed; but this does not deprive mental life of all [591] purpose, for we have seen how, after voluntary purposive ideas have been abandoned, involuntary ones assume command. We have not merely accepted the fact of the looseness of associative connections in dreams [p. 51 f.], but we have shown that it extends far further than had been suspected; we have found, however, that these loose connections are merely obligatory substitutes for others which are valid and significant. It is quite true that we have described dreams as absurd; but examples have taught us how sensible a dream can be even when it appears to be absurd.

We have no difference of opinion over the functions that are to be assigned to dreams. The view that dreams act as a safety-valve to the mind [p. 70] and that, in the words of Robert [1886, 10 f.], all kinds of harmful things are made harmless by being presented in a dream – not

only does this view coincide exactly with our theory of the double wish fulfilment brought about by dreams, but the way in which it is phrased is more intelligible to us than to Robert himself. The view that the mind has free play in its functioning in dreams [p. 72 f. above] is represented in our theory by the fact of the preconscious activity allowing dreams to take their course. Such phrases as 'a return of the mind in dreams to an embryonic point of view' or the words used by Havelock Ellis [1899*a*, 721] to describe dreams – 'an archaic world of vast emotions and imperfect thoughts' [p. 53] – strike us as happy anticipations of our own assertions that primitive modes of activity which are suppressed during the day are concerned in the construction of dreams. We have been able to accept entirely as our own what Sully [1893, 362] has written: 'Our dreams are a means of conserving these [earlier] successive personalities. When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us' [p. 53].[1] For us no less than for Delage [1891] what has been 'suppressed' [p. 72] has become 'the driving force of dreams'.

We have fully appreciated the importance of the part ascribed by Scherner [1861] to 'dream imagination', as well as Scherner's own interpretations [p. 73 ff.], but we have been obliged to transport them, as it were, to a different position in the problem. The point is not that dreams create the imagination, but rather that the unconscious activity of the [592]
imagination has a large share in the construction of the dream thoughts. We remain in Scherner's debt for having indicated the source of the dream thoughts; but nearly everything that he ascribes to the dream-work is really attributable to the activity of the unconscious during daytime, which is the instigating agent of dreams no less than of neurotic symptoms. We have been obliged to distinguish the 'dream-work' as something quite different and with a much narrower connotation.

Finally, we have by no means abandoned the relation between dreams and mental disorders [p. 79 ff.], but have established it more firmly on fresh ground.

We have thus been able to find a place in our structure for the most various and contradictory findings of earlier writers, thanks to the novelty of our theory of dreams, which combines them, as it were, into a higher unity. Some of those findings we have put to other uses, but we have wholly rejected only a few. Nevertheless, our edifice is still

1 [The last two sentences were added in 1914.]

uncompleted. Apart from the many perplexing questions in which we have become involved in making our way into the obscurities of psychology, we seem to be troubled by a fresh contradiction. On the one hand we have supposed that the dream thoughts arise through entirely normal mental activity; but on the other hand we have discovered a number of quite abnormal processes of thought among the dream thoughts, which extend into the dream content, and which we then repeat in the course of our dream interpretation. Everything that we have described as the 'dream-work' seems to depart so widely from what we recognize as rational thought processes that the most severe strictures passed by earlier writers on the low level of psychical functioning in dreams must appear fully justified.

It may be that we shall only find enlightenment and assistance in this difficulty by carrying our investigation still further. And I will begin by picking out for closer examination one of the conjunctures which may lead to the formation of a dream.

A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we
[593] value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream thoughts. There is no need to assume, however, that this activity of thought is performed during sleep – a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that *the most complicated achievements of thought are possible without the assistance of consciousness* – a fact which we could not fail to learn in any case from every psychoanalysis of a patient suffering from hysteria or from obsessional ideas. These dream thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function [p. 483 above], that of attention – a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other

purpose.[1] There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

To sum up – we describe a train of thought such as this as 'preconscious'; we regard it as completely rational and believe that it may either have been simply neglected or broken off and suppressed. Let us add a frank account of how we picture the occurrence of a train of ideas. We believe that, starting from a purposive idea, a given amount of excitation, which we term 'cathectic energy', is displaced along the associative paths selected by that purposive idea. A train of thought which is 'neglected' is one which has *not received* this cathexis; a train of thought which is 'suppressed' or 'repudiated' is one from which this cathexis has been *withdrawn*. In both cases they are left to their own excitations. Under certain conditions a train of thought with a purposive cathexis is capable of attracting the attention of consciousness to itself and in that event, through the agency of consciousness, receives a 'hypercathexis'. We shall be obliged presently to explain our view of the nature and function of consciousness. [See p. 550 ff. below.] [594]

A train of thought that has been set going like this in the preconscious may either cease spontaneously or persist. We picture the first of these outcomes as implying that the energy attaching to the train of thought is diffused along all the associative paths that radiate from it; this energy sets the whole network of thoughts in a state of excitation which lasts for a certain time and then dies away as the excitation in search of discharge becomes transformed into a quiescent cathexis. If this first outcome supervenes, the process is of no further significance

1 [The concept of 'attention' plays a very small part in Freud's later writings. It figures prominently, on the other hand, in his 'Project for a Scientific Psychology' (Freud, 1950*a*), e.g. in the opening section of Part III. Cf. also pp. 514 f. above and 549 below.]

so far as dream formation is concerned. Lurking in our preconscious, however, there are other purposive ideas, which are derived from sources in our unconscious and from wishes which are always on the alert. These may take control of the excitation attaching to the group of thoughts which has been left to its own devices, they may establish a connection between it and an unconscious wish, and they may 'transfer' to it the energy belonging to the unconscious wish. Thenceforward the neglected or suppressed train of thought is in a position to persist, though the reinforcement it has received gives it no right of entry into consciousness. We may express this by saying that what has hitherto been a preconscious train of thought has now been 'drawn into the unconscious'.

There are other conjunctures which may lead to the formation of a dream. The preconscious train of thought may have been linked to the
[595] unconscious wish from the first and may for that reason have been repudiated by the dominant purposive cathexis; or an unconscious wish may become active for other reasons (from somatic causes, perhaps) and may seek to effect a transference on to the psychical residues that are uncathected by the *Pcs*. without their coming halfway to meet it. But all three cases have the same final outcome: a train of thought comes into being in the preconscious which is without a preconscious cathexis but has received a cathexis from an unconscious wish.

From this point onwards the train of thought undergoes a series of transformations which we can no longer recognize as normal psychical processes and which lead to a result that bewilders us – a psychopathological structure. I will enumerate these processes and classify them.

(1) The intensities of the individual ideas become capable of discharge *en bloc* and pass over from one idea to another, so that certain ideas are formed which are endowed with great intensity. [Cf. p. 294 above.] And since this process is repeated several times, the intensity of a whole train of thought may eventually be concentrated in a single ideational element. Here we have the fact of 'compression' or 'condensation', which has become familiar in the dream-work. It is this that is mainly responsible for the bewildering impression made on us by dreams, for nothing at all analogous to it is known to us in mental life that is normal and accessible to consciousness. In normal mental life, too, we find ideas which, being the nodal points or end results of whole chains of thought, possess a high degree of psychical significance; but their significance is not expressed by any feature that is obvious in a *sensory* manner to

internal perception; their perceptual presentation is not in any respect more intense on account of their psychical significance. In the process of condensation, on the other hand, every psychical interconnection is transformed into an *intensification* of its ideational content. The case is the same as when, in preparing a book for the press, I have some word which is of special importance for understanding the text printed in spaced or heavy type; or in speech I should pronounce the same word loudly and slowly and with special emphasis. The first of these two analogies reminds us at once of an example provided by the dream-work itself: the word '*trimethylamine*' in the dream of Irma's injection [p. 103 f. above]. Art historians have drawn our attention to the fact that the earli- [596]
est historical sculptures obey a similar principle: they express the rank of the persons represented by their size. A king is represented twice or three times as large as his attendants or as his defeated enemies. A sculpture of Roman date would make use of subtler means for producing the same result. The figure of the emperor would be placed in the middle, standing erect, and would be modelled with special care, while his enemies would be prostrate at his feet; but he would no longer be a giant among dwarfs. The bows with which inferiors greet their superiors among ourselves today are an echo of the same ancient principle of representation.

The direction in which condensations in dreams proceed is determined on the one hand by the rational preconscious relations of the dream thoughts, and on the other by the attraction exercised by visual memories in the unconscious. The outcome of the activity of condensation is the achievement of the intensities required for forcing a way through into the perceptual systems.

(2) Owing, once more, to the freedom with which the intensities can be transferred, 'intermediate ideas', resembling compromises, are constructed under the sway of condensation. (Cf. the numerous instances I have given of this [e.g. p. 260 ff.].) This is again something unheard of in normal chains of ideas, where the main stress is laid on the selection and retention of the 'right' ideational element. On the other hand, composite structures and compromises occur with remarkable frequency when we try to express preconscious thoughts in speech. They are then regarded as species of 'slips of the tongue'.

(3) The ideas which transfer their intensities to each other stand in the loosest mutual relations. They are linked by associations of a kind that is scorned by our normal thinking and relegated to the use of jokes. In particular, we find associations based on homonyms and verbal similarities treated as equal in value to the rest.

(4) Thoughts which are mutually contradictory make no attempt to do away with each other, but persist side by side. They often combine to form condensations, just as though there were no contradiction between them, or arrive at compromises such as our conscious thoughts would never tolerate but such as are often admitted in our actions.

[597] These are some of the most striking of the abnormal processes to which the dream thoughts, previously constructed on rational lines, are subjected in the course of the dream-work. It will be seen that the chief characteristic of these processes is that the whole stress is laid upon making the cathecting energy mobile and capable of discharge; the content and the proper meaning of the psychical elements to which the cathexes are attached are treated as of little consequence. It might have been supposed that condensation and the formation of compromises is only carried out for the sake of facilitating regression, that is, when it is a question of transforming thoughts into images. But the analysis – and still more the synthesis – of dreams which include no such regression to images, e.g. the dream of 'Autodidasker – conversation with Professor N.' [p. 266 ff. above], exhibits the same processes of displacement and condensation as the rest.

Thus we are driven to conclude that two fundamentally different kinds of psychical process are concerned in the formation of dreams. One of these produces perfectly rational dream thoughts, of no less validity than normal thinking; while the other treats these thoughts in a manner which is in the highest degree bewildering and irrational. We have already in Chapter VI segregated this second psychical process as being the dream-work proper. What light have we now to throw upon its origin?

It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently [*nachträglich*]. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: *they have been transformed into the symptom by means of condensation and the*

formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression. In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the [598] conclusions we have been led to by hysteria.

We accordingly borrow the following thesis from the theory of hysteria: *a normal train of thought is only submitted to abnormal psychical treatment of the sort we have been describing if an unconscious wish, derived from infancy and in a state of repression, has been transferred on to it*. In accordance with this thesis we have constructed our theory of dreams on the assumption that the dream wish which provides the driving power invariably originates from the unconscious – an assumption which, as I myself am ready to admit, cannot be proved to hold generally, though neither can it be disproved. But in order to explain what is meant by 'repression', a term with which we have already made play so many times, it is necessary to proceed a stage further with our psychological scaffolding.

We have already [p. 505 ff. above] explored the fiction of a primitive psychical apparatus whose activities are regulated by an effort to avoid an accumulation of excitation and to maintain itself so far as possible without excitation. For that reason it is built upon the plan of a reflex apparatus. The power of movement, which is in the first instance a means of bringing about internal alterations in its body, is at its disposal as the path to discharge. We went on to discuss the psychical consequences of an 'experience of satisfaction'; and in that connection we were already able to add a second hypothesis, to the effect that the accumulation of excitation (brought about in various ways that need not concern us) is felt as unpleasure and that it sets the apparatus in action with a view to repeating the experience of satisfaction, which involved a diminution of excitation and was felt as pleasure. A current of this kind in the apparatus, starting from unpleasure and aiming at pleasure, we have termed a 'wish'; and we have asserted that only a wish is able to set the apparatus in motion and that the course of the excitation in it is automatically regulated by feelings of pleasure and unpleasure. The first wishing seems to have been a hallucinatory cathecting of the memory of satisfaction. Such hallucinations, however, if they were not to be maintained to the point of exhaustion, proved to be inadequate to bring about the cessation of the need or, accordingly, the pleasure attaching to satisfaction.

[599] A second activity – or, as we put it, the activity of a second system – became necessary, which would not allow the mnemic cathexis to proceed as far as perception and from there to bind the psychical forces; instead, it diverted the excitation arising from the need along a roundabout path which ultimately, by means of voluntary movement, altered the external world in such a way that it became possible to arrive at a real perception of the object of satisfaction. We have already outlined our schematic picture of the psychical apparatus up to this point; the two systems are the germ of what, in the fully developed apparatus, we have described as the *Ucs*. and *Pcs*.

In order to be able to employ the power of movement to make alterations in the external world that shall be effective, it is necessary to accumulate a great number of experiences in the mnemic systems and a multiplicity of permanent records of the associations called up in this mnemic material by different purposive ideas. [Cf. p. 481 f. above.] We can now carry our hypotheses a step further. The activity of this second system, constantly feeling its way, and alternately sending out and withdrawing cathexes, needs, on the one hand, to have the whole of the material of memory freely at its command; but, on the other hand, it would be an unnecessary expenditure of energy if it sent out large quantities of cathexis along the various paths of thought and thus caused them to drain away to no useful purpose and diminish the quantity available for altering the external world. I therefore postulate that for the sake of efficiency the second system succeeds in retaining the major part of its cathexes of energy in a state of quiescence and in employing only a small part on displacement. The mechanics of these processes are quite unknown to me; anyone who wished to take these ideas seriously would have to look for physical analogies to them and find a means of picturing the movements that accompany excitation of neurons. All that I insist upon is the idea that the activity of the *first* ψ-system is directed towards securing the *free discharge* of the quantities of excitation, while the *second* system, by means of the cathexes emanating from it, succeeds in *inhibiting* this discharge and in transforming the cathexis into a quiescent one, no doubt with a simultaneous raising of its level.[1] I presume, therefore, that under the dominion of the second system the discharge of excitation is governed by quite different mechanical conditions from those in force under the dominion of the first system. When once the [600] second system has concluded its exploratory thought activity, it releases

1 [Some light is thrown on Freud's use of the concept of 'level' of cathexis in Part III of his 'Project' of 1895 (1950*a*), *RSE*, **1**, 384 ff.]

the inhibition and damming up of the excitations and allows them to discharge themselves in movement.

Some interesting reflections follow if we consider the relations between this inhibition upon discharge exercised by the second system and the regulation effected by the unpleasure principle [*Unlustprinzip*].[1] Let us examine the antithesis to the primary experience of satisfaction – namely, the experience of an external fright. Let us suppose that the primitive apparatus is impinged upon by a perceptual stimulus which is a source of painful excitation. Uncoordinated motor manifestations will follow until one of them withdraws the apparatus from the perception and at the same time from the pain. If the perception reappears, the movement will at once be repeated (a movement of flight, it may be) till the perception has disappeared once more. In this case, no inclination will remain to recathect the perception of the source of pain, either hallucinatorily or in any other way. On the contrary, there will be an inclination in the primitive apparatus to drop the distressing mnemic image immediately, if anything happens to revive it, for the very reason that if its excitation were to overflow into perception it would provoke unpleasure (or, more precisely, would *begin* to provoke it). The avoidance of the memory, which is no more than a repetition of the previous flight from the perception, is also facilitated by the fact that the memory, unlike the perception, does not possess enough quality to excite consciousness and thus to attract fresh cathexis to itself. This effortless and regular avoidance by the psychical process of the memory of anything that had once been distressing affords us the prototype and first example of *psychical repression*. It is a familiar fact that much of this avoidance of what is distressing – this ostrich policy – is still to be seen in the normal mental life of adults.

As a result of the unpleasure principle, then, the first ψ-system is totally incapable of bringing anything disagreeable into the context of its thoughts. It is unable to do anything but wish. If things remained at that point, the thought activity of the second system would be obstructed, since it requires free access to *all* the memories laid down by experience. Two possibilities now present themselves. Either the activity of the second system might set itself entirely free from the unpleasure principle and proceed without troubling about the unpleasure of memories; or it [601]
might find a method of cathecting unpleasurable memories which would enable it to avoid releasing the unpleasure. We may dismiss the first of these possibilities, for the unpleasure principle clearly regulates the

1 [In his later works, Freud speaks of it as the 'pleasure principle' [*Lustprinzip*]. An exception occurs in Lecture IV of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 66.]

course of excitation in the second system as much as in the first. We are consequently left with the remaining possibility that the second system cathects memories in such a way that there is an inhibition of their discharge, including, therefore, an inhibition of discharge (comparable to that of a motor innervation) in the direction of the development of unpleasure. We have therefore been led from two directions to the hypothesis that cathexis by the second system implies a simultaneous inhibition of the discharge of excitation: we have been led to it by regard for the unpleasure principle and also [as was shown in the last paragraph but one] by the principle of the least expenditure of innervation. Let us bear this firmly in mind, for it is the key to the whole theory of repression: *the second system can only cathect an idea if it is in a position to inhibit any development of unpleasure that may proceed from it*. Anything that could evade that inhibition would be inaccessible to the second system as well as to the first; for it would promptly be dropped in obedience to the unpleasure principle. The inhibition of unpleasure need not, however, be a complete one: a beginning of it must be allowed, since that is what informs the second system of the nature of the memory concerned and of its possible unsuitability for the purpose which the thought process has in view.

I propose to describe the psychical process of which the first system alone admits as the 'primary process', and the process which results from the inhibition imposed by the second system as the 'secondary process'.[1]

[602] There is yet another reason for which, as I can show, the second system is obliged to correct the primary process. The primary process endeavours to bring about a discharge of excitation in order that, with the help of the amount of excitation thus accumulated, it may establish a

1 [*Primärvorgang* and *Sekundärvorgang*. The distinction between the primary and secondary systems, and the hypothesis that psychical functioning operates differently in them, are among the most fundamental of Freud's concepts. They are associated with the theory (indicated on p. 536 f. above and at the opening of the next section) that psychical energy occurs in two forms: 'free' or 'mobile' (as it occurs in the system *Ucs*.) and 'bound' or 'quiescent' (as it occurs in the system *Pcs*.). Where Freud discusses this subject in his later writings (e.g. in his paper on 'The Unconscious' (1915*e*), Section V; *RSE*, **14**, 166, and in *Beyond the Pleasure Principle* (1920*g*), Chapter IV; ibid., **18**, 26 ff.), he attributes the latter distinction to some statement of Breuer's in their joint *Studies on Hysteria* (1895*d*). There is some difficulty in identifying any such statement in Breuer's contribution to that work (Chapter III). The nearest approach to it is a footnote near the beginning of Section 2, in which Breuer distinguishes three forms of nervous energy: 'a potential energy which lies quiescent in the chemical substance of the cell', 'a kinetic energy which is discharged when the fibres are in a state of excitation' and 'yet another quiescent state of nervous excitation: tonic excitation or nervous tension'. On the other hand, the question of 'bound' energy is discussed at some length towards the end of the first section of Part III of Freud's 'Project' (1950*a*), written only a few months after the publication of the *Studies on Hysteria*.]

'perceptual identity' [with the experience of satisfaction (see p. 506 above)]. The secondary process, however, has abandoned this intention and taken on another in its place – the establishment of a '*thought* identity' [with that experience]. All thinking is no more than a circuitous path from the memory of a satisfaction (a memory which has been adopted as a purposive idea) to an identical cathexis of the same memory which it is hoped to attain once more through an intermediate stage of motor experiences. Thinking must concern itself with the connecting paths between ideas, without being led astray by the *intensities* of those ideas. But it is obvious that condensations of ideas, as well as intermediate and compromise structures, must obstruct the attainment of the identity aimed at. Since they substitute one idea for another, they cause a deviation from the path which would have led on from the first idea. Processes of this kind are therefore scrupulously avoided in secondary thinking. It is easy to see, too, that the unpleasure principle, which in other respects supplies the thought process with its most important signposts, puts difficulties in its path towards establishing 'thought identity'. Accordingly, thinking must aim at freeing itself more and more from exclusive regulation by the unpleasure principle and at restricting the development of affect in thought activity to the minimum required for acting as a signal.[1] The achievement of this greater delicacy in functioning is aimed at by means of a further hypercathexis, brought about by consciousness. [603]
[See below, p. 550 ff.] As we well know, however, that aim is seldom attained completely, even in normal mental life, and our thinking always remains exposed to falsification by interference from the unpleasure principle.

This, however, is not the gap in the functional efficiency of our mental apparatus which makes it possible for thoughts, which represent themselves as products of the secondary thought activity, to become subject to the primary psychical process – for such is the formula in which we can now describe the activity which leads to dreams and to hysterical symptoms. Inefficiency arises from the convergence of two factors derived from our developmental history. One of these factors devolves entirely upon the mental apparatus and has had a decisive influence on the relation between the two systems, while the other makes itself felt to a variable degree and introduces driving forces [*Triebkräfte*] of organic

1 [This idea of a small amount of unpleasure acting as a 'signal' to prevent the occurrence of a much larger amount was taken up by Freud many years later and applied to the problem of anxiety. See Freud (1926*d*), Chapter XI, Section A (*b*); *RSE*, **20**, 142 ff.]

origin into mental life. Both of them originate in childhood and are a precipitate of the modifications undergone by our mental and somatic organism since our infancy.

When I described one of the psychical processes occurring in the mental apparatus as the 'primary' one, what I had in mind was not merely considerations of relative importance and efficiency; I intended also to choose a name which would give an indication of its chronological priority. It is true that, so far as we know, no psychical apparatus exists which possesses a primary process only and that such an apparatus is to that extent a theoretical fiction. But this much is a fact: the primary processes are present in the mental apparatus from the first, while it is only during the course of life that the secondary processes unfold, and come to inhibit and overlay the primary ones; it may even be that their complete domination is not attained until the prime of life. In consequence of the belated appearance of the secondary processes, the core of our being, consisting of unconscious wishful impulses, remains inaccessible to the understanding and inhibition of the preconscious; the part played by the latter is restricted once and for all to directing along the most expedient paths the wishful impulses that arise from the unconscious. These unconscious wishes exercise a compelling
[604] force [*Zwang*] upon all later mental trends, a force which those trends are obliged to fall in with or which they may perhaps endeavour to divert and direct to higher aims. A further result of the belated appearance of the secondary process is that a wide sphere of mnemic material is inaccessible to preconscious cathexis.

Among these wishful impulses derived from infancy, which can neither be destroyed nor inhibited, there are some whose fulfilment would be a contradiction of the purposive ideas of secondary thinking. The fulfilment of these wishes would no longer generate an affect of pleasure but of unpleasure; and *it is precisely this transformation of affect which constitutes the essence of what we term 'repression'*. The problem of repression lies in the question of how it is and owing to what driving forces that this transformation occurs; but it is a problem that we need only touch upon here.[1] It is enough for us to be clear that a transformation of this kind does occur in the course of development – we have only to recall the way in which disgust emerges in childhood after having been absent to begin with – and that it is related to the activity of the secondary

1 [The subject was afterwards dealt with by Freud at much greater length in his paper on 'Repression' (1915*d*), *RSE*, **14**, 129 ff.; his later views on the subject are given in Lecture XXXII of his *New Introductory Lectures* (1933*a*), ibid., **22**, 72 ff.]

system. The memories on the basis of which the unconscious wish brings about the release of affect were never accessible to the *Pcs*., and consequently the release of the affect attaching to those memories cannot be inhibited either. It is for the very reason of this generation of affect that these ideas are now inaccessible even by way of the preconscious thoughts on to which they have transferred their wishful force. On the contrary, the unpleasure principle takes control and causes the *Pcs*. to turn away from the transference thoughts. They are left to themselves – 'repressed' – and thus it is that the presence of a store of infantile memories, which has from the first been held back from the *Pcs*., becomes a *sine qua non* of repression.

In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the *Pcs*.; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their [605] excitation, even if they have lost their cathexis from the *Pcs*. There then follows a defensive struggle – for the *Pcs*. in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis'[1]) – and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychical process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychical apparatus are the *primary* ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not, in fact, falsifications of normal processes – intellectual errors – but are modes of activity of the psychical apparatus that have been freed from an

1 [This parenthesis was added in 1919.]

inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a *comic* effect, that is, a surplus of energy which has to be discharged in *laughter, if we allow these modes of thinking to force their way through into consciousness*.[1]

[606] The theory of the psychoneuroses asserts as an indisputable and invariable fact that only sexual wishful impulses from infancy, which have undergone repression (i.e. a transformation of their affect) during the developmental period of childhood, are capable of being revived during *later* developmental periods (whether as a result of the subject's sexual constitution, which is derived from an initial bisexuality, or as a result of unfavourable influences acting upon the course of his sexual life) and are thus able to furnish the driving force for the formation of psychoneurotic symptoms of every kind.[2] It is only by reference to these sexual forces that we can close the gaps that are still patent in the theory of repression. I will leave it an open question whether these sexual and infantile factors are equally required in the theory of dreams: I will leave that theory incomplete at this point, since I have already gone a step beyond what can be demonstrated in assuming that dream wishes are invariably derived from the unconscious.[3] Nor do I propose to enquire

1 [This topic was dealt with by Freud at greater length in Chapter V of his book on *Jokes* (1905*c*), *RSE*, **8**, 127 ff. The question of intellectual errors was discussed more fully in the closing pages of the 'Project' (1950*a*), ibid., **1**, 407 ff.]

2 [The theme of this sentence was elaborated by Freud in his *Three Essays on the Theory of Sexuality* (1905*d*), ibid., **7**, 145 ff.]

3 Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words 'suppressed' [*unterdrückt*] and 'repressed' [*verdrängt*]. It should have been clear, however, that the latter lays more stress than the former upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. – There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life

further into the nature of the distinction between the play of psychical forces in the formation of dreams and in that of hysterical symptoms: we are still without a sufficiently accurate knowledge of one of the two objects of the comparison. [607]

There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their driving forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness – or whatever more correct interpretations of the observed facts may take their place – all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If [608] we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that *what is suppressed continues to exist in normal people as*

as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the *Oneirocritica* of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion. [It should perhaps be added that the translator of *Oneirocritica*, F. S. Krauss, himself subsequently published the omitted chapter in his periodical *Anthropophyteia*, from which Freud has quoted above (p. 318 *n.* 2) and of which he speaks so highly elsewhere (1910*f*), *RSE*, **11**, 223 f., and (1913*k*), ibid., **12**, 335 ff.]

well as abnormal, and remains capable of psychical functioning. Dreams themselves are among the manifestations of this suppressed material; this is so theoretically in every case, and it can be observed empirically in a great number of cases at least, and precisely in cases which exhibit most clearly the striking peculiarities of dream life. In waking life the suppressed material in the mind is prevented from finding expression and is cut off from internal perception owing to the fact that the contradictions present in it are eliminated – one side being disposed of in favour of the other; but during the night, under the sway of an impetus towards the construction of compromises, this suppressed material finds methods and means of forcing its way into consciousness.

Flectere si nequeo superos, Acheronta movebo.[1]

The interpretation of dreams is the royal road to a knowledge of the unconscious activities of the mind.

By analysing dreams we can take a step forward in our understanding of the composition of that most marvellous and most mysterious of all instruments. Only a small step, no doubt; but a beginning. And this beginning will enable us to proceed further with its analysis, on the basis of other structures which must be termed pathological. For illnesses – those, at least, which are rightly named 'functional' – do not presuppose the disintegration of the apparatus or the production of fresh splits in its interior. They are to be explained on a *dynamic* basis – by the strengthening and weakening of the various components in the interplay of forces, so many of whose effects are hidden from view while functions are normal. I hope to be able to show elsewhere how the compounding of the
[609] apparatus out of two agencies makes it possible for the normal mind too to function with greater delicacy than would be possible with only one of them.[2]

1 ['If I cannot bend the Higher Powers, I will move the Infernal Regions.' Freud remarks in a note in *GS*, **3** (1925), 169, that 'this line of Virgil [*Aeneid*, VII, 312] is intended to picture the efforts of the repressed impulses of the drives'. He has used the same line as the motto for the whole volume. (See the additional note to the half-title of the book: *RSE*, **4**, xiii.) In a letter to Fliess of December 4, 1896 (Freud, 1950*a*, Letter 51), he proposed using it as a motto for a chapter on 'Symptom-formation' in some projected but unrealized work. – The next sentence was added in 1909. It was included in the same year in the third of his lectures at Clark University (Freud, 1910*a*), *RSE*, **11**, 32 f.]

2 Dreams are not the only phenomena which allow us to find a basis for psychopathology in psychology. In a short series of papers (1898*b* and 1899*a*) which is not yet completed, I have attempted to interpret a number of phenomena of daily life as evidence in favour of the same conclusions. [*Added* 1909:] These, together with some further papers on forgetting, slips of the tongue, bungled actions, etc., have since been collected under the title of *The Psychopathology of Everyday Life* (Freud, 1901*b*). [*RSE*, **6**, 1 ff.]

(F)
THE UNCONSCIOUS AND CONSCIOUSNESS – REALITY

It will be seen on closer consideration that what the psychological discussion in the preceding sections invites us to assume is not the existence of two *systems* near the motor end of the apparatus but the existence of two kinds of *processes of excitation* or *modes of its discharge*. It is all one to us, for we must always be prepared to drop our conceptual scaffolding if we feel that we are in a position to replace it by something that approximates more closely to the unknown reality. So let us try to correct some conceptions which might be misleading so long as we looked upon the two systems in the most literal and crudest sense as two localities in the mental apparatus – conceptions which have left their traces in the expressions 'to repress' and 'to force a way through'. Thus, we may speak of an unconscious thought seeking to convey itself into the preconscious so as to be able then to force its way through into consciousness. What we have in mind here is not the forming of a second thought situated in a new place, like a transcription which continues to exist alongside the original; and the notion of forcing a way through into consciousness must be kept carefully free from any idea of a change of locality. Again, we may speak of a preconscious thought being repressed or driven out and then taken over by the unconscious. These images, derived from a set of ideas relating to a struggle for a piece of ground, may tempt us to suppose that it is literally true that a mental grouping in one locality has been brought to an end and replaced by a fresh one in another locality. Let us replace these metaphors by something that seems to correspond better to the real state of affairs, and let us say instead that some particular mental grouping has had a cathexis of energy attached to it or withdrawn from it, so that the structure in question has come under the sway of a particular agency or been withdrawn from it. What we are doing here is once again to replace a topographical way of representing things by a dynamic one. What we regard as mobile is not the psychical structure [*Gebilde*] itself but its innervation.[1]

[610]

[611]

1 [*Footnote added* 1925:] It became necessary to elaborate and modify this view after it was recognized that the essential feature of a preconscious idea was the fact of its being connected with the residues of verbal presentations. Cf. 'The Unconscious' (1915*e* [Section VII; *RSE*, **14**, 177–8]). [As is there pointed out, however, this was already indicated in the first edition of the present work. (See pp. 514 above and 551 f. below.) It is also foreshadowed in the 'Project' (1950*a*), Part III, Sections 1 and 2; *RSE*, **1**, 384 ff.]

Nevertheless, I consider it expedient and justifiable to continue to make use of the figurative image of the two systems. We can avoid any possible abuse of this method of representation by recollecting that ideas, thoughts and psychical structures in general must never be regarded as localized in organic elements of the nervous system but rather, as one might say, *between* them,[1] where resistances [*Widerstände*] and facilitations [*Bahnungen*] provide the corresponding correlates. Everything that can be an object of our internal perception is *virtual*, like the image produced in a telescope by the passage of light-rays. But we are justified in assuming the existence of the systems (which are not in any way psychical entities themselves and can never be accessible to our psychical perception) like the lenses of the telescope, which cast the image. And, if we pursue this analogy, we may compare the censorship between two systems to the refraction which takes place when a ray of light passes into a new medium.

So far we have been psychologizing on our own account. It is time now to consider the theoretical views which govern present-day psychology and to examine their relation to our hypotheses. The problem of the unconscious in psychology is, in the forcible words of Lipps (1897), less *a* psychological problem than *the* problem of psychology. So long as psychology dealt with this problem by a verbal explanation to the effect that 'psychical' *meant* 'conscious' and that to speak of 'unconscious psychical processes' was palpable nonsense, any psychological evaluation of the observations made by physicians upon abnormal mental states was out of the question. The physician and the philosopher can only come together if they both recognize that the term 'unconscious psychical processes' is 'the appropriate and justified expression of a
[612] solidly established fact'. The physician can only shrug his shoulders when he is assured that 'consciousness is an indispensable characteristic of what is psychical', and perhaps, if he still feels enough respect for the utterances of philosophers, he may presume that they have not been dealing with the same thing or working at the same science. For even a single understanding observation of a neurotic's mental life or a single analysis of a dream must leave him with an unshakeable conviction that the most complicated and most rational thought processes, which can surely not be denied [*versagen*] the name of psychical processes, can

1 [Freud introduced this anti-localizationist notion – which underpinned the whole of his transition from neurology to metapsychology – in his monograph on aphasia (1891*b*; *NSW*, **4**, Chapter V). The notion is elaborated upon in an Editors' footnote to the 'Project' (1950*a* [1895]), *RSE*, **1**, 344 *n.* 3, and discussed at length by Solms & Saling (1986).]

occur without exciting the subject's consciousness.[1] It is true that the physician cannot learn of these unconscious processes until they have produced some effect upon consciousness which can be communicated or observed. But this conscious effect may exhibit a psychical character quite different from that of the unconscious process, so that internal perception cannot possibly regard the one as a substitute for the other. The physician must feel at liberty to proceed by *inference* from the conscious effect to the unconscious psychical process. He thus learns that the conscious effect is only a remote psychical result of the unconscious process and that the latter has not become conscious as such; and, moreover, that the latter was present and operative even without betraying its existence in any way to consciousness.

It is essential to abandon the overvaluation of the property of being conscious before it becomes possible to form any correct view of the origin of what is mental. In Lipps's words [1897, 146 f.], the unconscious must be assumed to be the general basis of psychical life. The unconscious is the larger sphere, which includes within it the smaller sphere of the conscious. Everything conscious has an unconscious preliminary stage; whereas what is unconscious may remain at that stage and nevertheless claim to be regarded as having the full value of a psychical process. The unconscious is the true psychical reality; *in its innermost nature it is as much unknown to us as the reality of the external world, and it is as incompletely presented by the data of consciousness as is the external world by the communications of our sense organs*.[2] [613]

Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner [1861, 114 f.] has said, dreams appear to engage in making

1 [*Footnote added* 1914:] I am happy to be able to point to an author who has drawn from the study of dreams the same conclusions as I have on the relation between conscious and unconscious activity. Du Prel (1885, 47) writes: 'The problem of the nature of the mind evidently calls for a preliminary investigation as to whether consciousness and mind are identical. This preliminary question is answered in the negative by dreams, which show that the concept of the mind is a wider one than that of consciousness, in the same kind of way in which the gravitational force of a heavenly body extends beyond its range of luminosity.' And again (ibid., 306 [quoting Maudsley, 1868, 15]): 'It is a truth which cannot be too distinctly borne in mind that consciousness is not coextensive with mind.'

2 [See Editors' footnote 2, p. 482 above.]

symbolic representations of the body [p. 75 above], we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream);[1] the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to overestimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

[614]

It would scarcely repay the trouble if we were to treat the historical significance of dreams as a separate topic. A dream may have impelled some chieftain to embark upon a bold enterprise the success of which has changed history. But this only raises a fresh problem so long as a dream is regarded as an alien power in contrast to the other more familiar forces of the mind; no such problem remains if a dream is recognized as a *form of expression* of impulses which are under the pressure of resistance during the day but which have been able to find reinforcement during the night from deep-lying sources of excitation.[2] The respect paid to dreams in antiquity is, however, based upon correct psychological insight and is the homage paid to the uncontrolled and indestructible forces in the human mind, to the 'demonic' power which produces the dream wish and which we find at work in our unconscious.

It is not without intention that I speak of 'our' unconscious. For what I thus describe is not the same as the unconscious of the philosophers or

1 [Tartini, the composer and violinist (1692–1770), is said to have dreamt that he sold his soul to the Devil, who thereupon seized a violin and played a sonata of exquisite beauty upon it with consummate skill. When the composer awoke he at once wrote down what he could recollect of it, and the result was his famous 'Trillo del Diavolo'.]

2 [*Footnote added* 1911:] Cf. in this connection Alexander the Great's dream during his siege of Tyre (*σά-τυρος*). (See p. 88 f. *n.* 2.)

even the unconscious of Lipps. By them the term is used merely to indicate a contrast with the conscious: the thesis which they dispute with so much heat and defend with so much energy is the thesis that apart from conscious there are also unconscious psychical processes. Lipps carries things further with his assertion that the whole of what is psychical exists unconsciously and that a part of it also exists consciously. But it is not in order to establish *this* thesis that we have summoned up the phenomena of dreams and of the formation of hysterical symptoms; the observation of normal waking life would by itself suffice to prove it beyond any doubt. The new discovery that we have been taught by the analysis of psychopathological structures [*Bildungen*] and of the first member of that class – the dream – lies in the fact that the unconscious (that is, the psychical) is found as a function of two separate systems and that this is the case in normal as well as in pathological life. Thus there are two kinds of unconscious, which have not yet been distinguished by psychologists. Both of them are unconscious in the sense used by psychology; but in our sense one of them, which we term the *Ucs*., is also *inadmissible to consciousness*, while we term the other the *Pcs*. because its excitations – after observing certain rules, it is true, and perhaps only after passing a fresh censorship, though nonetheless without regard to the *Ucs*. – are able to reach consciousness. The fact that excitations in order to reach consciousness must pass through a fixed series or hierarchy of agencies (which is revealed to us by the modifications made in them by censorship) has enabled us to construct a spatial analogy. We have described the relations of the two systems to each other and to consciousness by saying that the system *Pcs*. stands like a screen between the system *Ucs*. and consciousness. The system *Pcs*. not merely bars access to consciousness, it also controls access to the power of voluntary movement and has at its disposal for distribution a mobile cathectic energy, a part of which is familiar to us in the form of attention.[1] [See p. 530 f. above.] [615]

We must avoid, too, the distinction between 'supraconscious' and 'subconscious', which has become so popular in the more recent literature of the psychoneuroses, for such a distinction seems precisely calculated to stress the equivalence of what is psychical to what is conscious.

1 [*Footnote added* 1914:] Cf. my remarks on the concept of the unconscious in psychoanalysis (Freud, 1912*g*), first published in English in the *Proceedings* of the Society for Psychical Research, **26**, [312], in which I have distinguished the descriptive, dynamic and systematic meanings of the highly ambiguous word 'unconscious'. [The whole topic is discussed in the light of Freud's later views in Chapter I of *The Ego and the Id* (1923*b*), *RSE*, **19**, 12 ff.]

But what part is there left to be played in our scheme by consciousness, which was once so omnipotent and hid all else from view? *Only that of a sense organ for the perception of psychical qualities*.[1] In accordance with the ideas underlying our attempt at a schematic picture, we can only regard conscious perception as the function proper to a particular system; and for this the abbreviation *Cs*. seems appropriate. In its mechanical properties we regard this system as resembling the perceptual systems *Pcpt*.: as being susceptible to excitation by qualities but incapable of retaining traces of alterations – that is to say, as having no memory. The psychical apparatus, which is
[616] turned towards the external world with its sense organ of the *Pcpt*. systems, is itself the external world in relation to the sense organ of the *Cs*., whose teleological justification resides in this circumstance. Here we once more meet the principle of the hierarchy of agencies, which seems to govern the structure of the apparatus. Excitatory material flows in to the *Cs*. sense organ from two directions: from the *Pcpt*. system, whose excitation, determined by qualities, is probably submitted to a fresh revision before it becomes a conscious sensation, and from the interior of the apparatus itself, whose quantitative processes are felt qualitatively in the pleasure–unpleasure series when, subject to certain modifications, they make their way to consciousness.[2]

Those philosophers who have become aware that rational and highly complex thought structures are possible without consciousness playing any part in them have found difficulty in assigning any function to consciousness; it has seemed to them that it can be no more than a superfluous reflected picture of the completed psychical process. We, on the other hand, are rescued from this embarrassment by the analogy between our *Cs*. system and the perceptual systems. We know that perception by our sense organs has the result of directing a cathexis of attention to the paths along which the incoming sensory excitation is spreading: the qualitative excitation of the *Pcpt*. system acts as a regulator of the discharge of the mobile quantity in the psychical apparatus. We can attribute the same function to the overlying sense organ of the *Cs*. system. By perceiving new qualities, it

1 [Freud's use of the terms 'quantity' and 'quality' is fully explained in Part I of his 'Project' (1950*a*), *RSE*, **1**, 319 ff.]

2 [This localization of the *Cs*. system does not tally in a straightforward way with what Freud wrote in footnote 1, p. 484 above. See also p. 514 above. For a full discussion of this problem, see the Editors' Introduction to the 'Project' (*RSE*, **1**, 313 *n*. 2). See also Editors' footnote 4, p. 350 in ibid., **1**.]

makes a new contribution to directing the mobile quantities of cathexis and distributing them in an expedient fashion. By the help of its perception of pleasure and unpleasure it influences the discharge of the cathexes within what is otherwise an unconscious apparatus operating by means of the displacement of quantities. It seems probable that in the first instance the unpleasure principle regulates the displacement of cathexes automatically. But it is quite possible that consciousness of these qualities may introduce in addition a second and more discriminating regulation, which is even able to oppose the former one, and which perfects the efficiency of the apparatus by enabling it, in contradiction to its original plan, to cathect and work over even what is associated with the release of unpleasure. We learn from the psychology of the neuroses that these processes of regulation carried out by the qualitative excitation of the sense organs play a great part in the [617]
functional activity of the apparatus. The automatic domination of the primary unpleasure principle and the consequent restriction imposed upon efficiency are interrupted by the processes of sensory regulation, which are themselves in turn automatic in action. We find that repression (which, though it served a useful purpose to begin with, leads ultimately to a damaging loss of inhibition and mental control) affects memories so much more easily than perceptions because the former can receive no extra cathexis from the excitation of the psychical sense organs. It is true, on the one hand, that a thought which has to be warded off cannot become conscious, because it has undergone repression; but, on the other hand, it sometimes happens that a thought of this kind is repressed only because for other reasons it has been withdrawn from conscious perception. Here are some hints of which we take advantage in our therapeutic procedure in order to undo repressions which have already been effected.

The value of the hypercathexis which is set up in the mobile quantities by the regulating influence of the sense organ of the *Cs*. cannot be better illustrated in its teleological aspect than by the fact of its creation of a new series of qualities and consequently of a new process of regulation which constitutes the superiority of men over animals. Thought processes are in themselves without quality, except for the pleasurable and unpleasurable excitations which accompany them, and which, in view of their possible disturbing effect upon thinking, must be kept within bounds. In order that thought processes may acquire quality, they are associated in human beings with verbal memories, whose residues of quality are sufficient to draw the attention of consciousness to them and

to endow the process of thinking with a new mobile cathexis from consciousness. [Cf. pp. 514 and 545 *n*. above.]

The whole multiplicity of the problems of consciousness can only be grasped by an analysis of the thought processes in hysteria. These give one the impression that the transition from a preconscious to a conscious cathexis is marked by a censorship similar to that between the *Ucs*. and the *Pcs*.[1] This censorship, too, only comes into force above a certain
[618] quantitative limit, so that thought structures of low intensity escape it. Examples of every possible variety of how a thought can be withheld from consciousness or can force its way into consciousness under certain limitations are to be found included within the framework of psychoneurotic phenomena; and they all point to the intimate and reciprocal relations between censorship and consciousness. I will bring these psychological reflections to an end with a report of two such examples.

I was called in to a consultation last year to examine an intelligent and unembarrassed-looking girl. She was most surprisingly dressed. For though as a rule a woman's clothes are carefully considered down to the last detail, she was wearing one of her stockings hanging down and two of the buttons on her blouse were undone. She complained of having pains in her leg and, without being asked, exposed her calf. But what she principally complained of was, to use her own words, that she had a feeling in her body as though there was something 'stuck into it' which was 'moving backwards and forwards' and was 'shaking' her through and through: sometimes it made her whole body feel 'stiff'. My medical colleague, who was present at the examination, looked at me; he found no difficulty in understanding the meaning of her complaint. But what struck both of us as extraordinary was the fact that it meant nothing to the patient's mother – though she must often have found herself in the situation which her child was describing. The girl herself had no notion of the bearing of her remarks; for if she had, she would never have given voice to them. In this case it had been possible to hoodwink the censorship into allowing a phantasy which would normally have been kept in the preconscious to emerge into consciousness under the innocent disguise of making a complaint.

Here is another example. A fourteen-year-old boy came to me for psychoanalytic treatment suffering from *tic convulsif*, hysterical vomiting, headaches, etc. I began the treatment by assuring him that if he shut his eyes he would see pictures or have ideas, which he was then to

1 [The censorship between the *Pcs*. and the *Cs*. appears only rarely in Freud's later writings. It is, however, discussed at length in Section VI of his paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 170–1.]

communicate to me. He replied in pictures. His last impression before coming to me was revived visually in his memory. He had been playing at draughts with his uncle and saw the board in front of him. He thought of various positions, favourable or unfavourable, and of moves that one must not make. He then saw a dagger lying on the board – an object that [619] belonged to his father but which his imagination placed on the board. Then there was a sickle lying on the board and next a scythe. And there now appeared a picture of an old peasant mowing the grass in front of the patient's distant home with a scythe. After a few days I discovered the meaning of this series of pictures. The boy had been upset by an unhappy family situation. He had a father who was a hard man, liable to fits of rage, who had been unhappily married to the patient's mother, and whose educational methods had consisted of threats. His father had been divorced from his mother, a tender and affectionate woman, had married again and had one day brought a young woman home with him who was to be the boy's new mother. It was during the first few days after this that the fourteen-year-old boy's illness had come on. His suppressed rage against his father was what had constructed this series of pictures with their understandable allusions. The material for them was provided by a recollection from mythology. The sickle was the one with which Zeus castrated his father; the scythe and the picture of the old peasant represented Kronos, the violent old man who devoured his children and on whom Zeus took such unfilial vengeance. [See p. 227 above.] His father's marriage gave the boy an opportunity of repaying the reproaches and threats which he had heard from his father long before because he had played with his genitals. (Cf. the playing at draughts; the forbidden moves; the dagger which could be used to kill.) In this case long-repressed memories and derivatives from them which had remained unconscious slipped into consciousness by a roundabout path in the form of apparently meaningless pictures.

Thus I would look for the *theoretical* value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the *practical* value of this study – I hear the question raised – as a means towards an understanding of the

[620] mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? Is the ethical significance of suppressed wishes to be made light of – wishes which, just as they lead to dreams, may some day lead to other things?

I do not feel justified in answering these questions. I have not considered this side of the problem of dreams further. I think, however, that the Roman emperor was in the wrong when he had one of his subjects executed because he had dreamt of murdering the emperor. [See above, p. 59.] He should have begun by trying to find out what the dream meant; most probably its meaning was not what it appeared to be. And even if a dream with another content had had this act of *lèse-majesté* as its meaning, would it not be right to bear in mind Plato's dictum that the virtuous man is content to *dream* what a wicked man really *does* [p. 59]? I think it is best, therefore, to acquit dreams. Whether we are to attribute *reality* to unconscious wishes, I cannot say. It must be denied, of course, to any transitional or intermediate thoughts. If we look at unconscious wishes reduced to their most fundamental and truest shape, we shall have to conclude, no doubt, that *psychical* reality is a particular form of existence not to be confused with *material* reality.[1] Thus there seems to be no justification for people's reluctance in accepting responsibility for the immorality of their dreams. When the mode of functioning of the mental apparatus is rightly appreciated and the relation between the conscious and the unconscious understood, the greater part of what is ethically objectionable in our dream and phantasy lives will be found to disappear. In the words of Hanns Sachs [1912, 569]: 'If we look in our consciousness at something that has been told us by a dream about a
[621] contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.'

Actions and consciously expressed opinions are as a rule enough for practical purposes in judging men's characters. Actions deserve to be considered first and foremost; for many impulses which force their way through to consciousness are even then brought to nothing by the real forces of mental life before they can mature into deeds. In fact, such

1 [This sentence does not appear in the first edition. In 1909 it appeared in the following form: 'If we look at unconscious wishes reduced to their most fundamental and truest shape, we shall have to remember, no doubt, that psychical reality too has more than one form of existence.' In 1914 the sentence first appeared as printed in the text, except that the last word but one was 'factual' and not 'material'. 'Material' was substituted in 1919. – The remainder of this paragraph was added in 1914. – Freud had already drawn a distinction between 'thought reality' and 'external reality' in the second section of Part III of his 'Project' (1950*a*), *RSE*, **1**, 397 and *n*. 1.]

impulses often meet with no psychical obstacles to their progress, for the very reason that the unconscious is certain that they will be stopped at some other stage. It is in any case instructive to get to know the much trampled soil from which our virtues proudly spring. Very rarely does the complexity of a human character, driven hither and thither by dynamic forces, submit to a choice between simple alternatives, as our antiquated morality would have us believe.[1]

And the value of dreams for giving us knowledge of the future? There is of course no question of that.[2] [Cf. p. 4 *n*. 2 above.] It would be truer to say instead that they give us knowledge of the past. For dreams are derived from the past in every sense. Nevertheless, the ancient belief that dreams foretell the future is not wholly devoid of truth. By picturing our wishes as fulfilled, dreams are after all leading us into the future. But this future, which the dreamer pictures as the present, has been moulded by his indestructible wish into a perfect likeness of the past.

1 [This subject is further discussed in Freud, 1925*i* (Section B); *RSE*, **19**, 119 ff.]

2 [In the 1911 edition only, the following footnote appeared at this point: 'Professor Ernst Oppenheim of Vienna has shown me, from the evidence of folklore, that there is a class of dreams in which the prophetic meaning has been dropped even in popular belief and which are perfectly correctly traced back to wishes and needs emerging during sleep. He will shortly be giving a detailed account of these dreams, which are as a rule narrated in the form of comic stories.' – Early in 1911 D. E. Oppenheim, a classical scholar and teacher in a Vienna secondary school, collaborated with Freud on a paper on 'Dreams in Folklore' (Freud, 1958*a*). This was not published in its authors' lifetime but appears in *RSE*, **12**, 179 ff., where further particulars can be found. Shortly afterwards, Oppenheim became an adherent of Adler's and resigned from the Vienna Psychoanalytical Society, of which he had been a member for two or three years.]

APPENDIX A

RUNNING HEADS FROM THE FIRST EDITION[1]

I. THE SCIENTIFIC LITERATURE ON THE PROBLEMS OF DREAMS [1]

Aristotle – Dream Doctrine of the Ancients [4]
Relation to Waking Life [7]
Dream Memory – Hypermnesia in Dreams [10]
Hypermnestic Dreams – Material from Childhood [14]
Recent Material – Remembering Incidental Impressions [16]
Stimuli and Sources of Dreams [18]
External Sensory Stimuli as Sources of Dreams [21]
Experimental Dreams – Dreams Stimulated by an Alarm Clock [23]
Illusion Theory of Objective Sensory Stimuli [26]
Hypnagogic Hallucinations [28]
Internal, Organic Somatic Stimuli [30]
Theories of Schopenhauer and Krauss [33]
Typical Dreams – Psychical Sources of Stimulation [35]
The Forgetting of Dreams [37]
Doubt as to the Reliability of Dream Memory [40]
Psychological Characteristics of Dreams [43]
Why We Believe in the Reality of Dream Images? [45]
Detachment of Ideas from their Psychical Value [47]
The Absurdity of Dreams [49]
Superficial Associations in Dreams [51]
Psychological Valuation of Dream Life [54]
The Moral Sense in Dreams [57]
Moral Responsibility for Dreams [59]

1 [The German first edition carried running heads on every right-side page which succinctly summarized the contents. We have included this listing of them in the *RSE* (in an English translation by Mark Solms) as they reveal something of Freud's own sense of the structure of his argument. The pagination in square brackets refers to the pages of the present translation that tally most closely with those atop which the heads originally appeared. Pagination of chapter heads (upper case) is included only in those instances where they appeared instead of running heads.]

Incompatible Ideas [61]
The Suppressed [64]
Theory of Partial Sleep of the Mind [67]
Robert's 'Excretion' Theory [69]
The 'Suppressed' in Delage's Theory [71]
Scherner's Theory – Dream Imagination [74]
Criticism of Scherner's Theory [76]
Relations Between Dreams and Psychoses [79]
Dreams and Psychosis. Wish Fulfilment [81]

II. THE METHOD OF INTERPRETING DREAMS: ANALYSIS OF A SPECIMEN DREAM

The Symbolic and Decoding Methods [86]
Psychological Preparation for Dream Interpretation [90]
Difficulties in the Material [93]
The Dream of Irma's Injection [95, 97, 99, 102, 104, 106]

III. A DREAM IS THE FULFILMENT OF A WISH [109]

Dreams of Convenience [111]
Undisguised Wishful Dreams [113]
Wishful Dreams of Young Children [115]

IV. DISTORTION IN DREAMS [119]

The Uncle Dream [121]
Interpretation of the Uncle Dream [123]
The Psychical Censorship [125]
Distressing Dreams are Disguised Wishful Dreams [129]
Dream of a Renounced Wish [131]
Hysterical Identification [133]
Resolution of Distressing Dreams [135, 138]
A Dream, a Disguised Fulfilment of a Repressed Wish [142]

V. THE MATERIAL AND SOURCES OF DREAMS

Recent and Indifferent Material in Dreams [145]
The Dream of the Botanical Monograph [150, 152]
The Role of Indifferent Recent Impressions [154]

The Indifferent Impression, a Displaced Substitute for the Significant [156]
'*Rapprochement forcé*' of Dream Stimuli [159]
There are no 'Innocent' Dreams [161]
Examples of 'Innocent' Dreams [164]
Infantile Material as Sources of Dreams [167]
The Infantile Factor in the Uncle Dream [169]
Dream of Longing for Rome [171]
The Infantile Factor in the Rome Dream [174]
Uncovering Childhood Experiences in Dream Interpretation [176]
Childhood Scenes in the Latent Dream Content [178]
Childhood Impressions in the Latent Dream Content [181]
The Hunger Dream of the Fates [183]
A Revolutionary Dream [186, 189]
Infantile Roots of the Revolutionary Dream [192]
Somatic Sources of Dreams [194]
Somatic Sources According to the Authorities [196]
Scherner's Theory of Somatic Stimuli [199]
Somatic Stimuli Treated as Recent Material [201]
The Dream of Riding [203]
The Wish to Prolong Sleep [206]
Utilizing Distressing Sensations to Fulfil Repressed Wishes [209]
A Dream of Being Inhibited [212]
Embarrassing Dreams of Being Naked [215]
Dreams of Nakedness Explained as Dreams of Exhibiting [217]
Dreams of the Death of Loved Ones [219]
The Hostility of Children Towards Siblings [222]
A Child's Idea of Being 'Dead' [224]
The Relation of Children to Parents [227]
The Sexual Impulses of Children Towards Parents [229]
The Infantile Root of the Oedipus Saga [232]
Interpreting *Hamlet* [234]
The Egoism of Dreams [237]
Other Typical Dreams [240, 243]

VI. THE DREAM-WORK

The Work of Condensation in the Formation of Dreams [247]
Overdetermination of Dream Elements [250]
'A Lovely Dream' [252]

Analysis of the 'Lovely' Dream [254]
The Beetle Dream [257]

APPENDIX B

A PREMONITORY DREAM FULFILLED[1]

[623] Frau B., an estimable woman who moreover possesses a critical sense, told me in another connection and without the slightest *arrière pensée* that once some years ago she dreamt she had met Dr K., a friend and former family doctor of hers, in the Kärntnerstrasse[2] in front of Hiess's shop. The next morning, while she was walking along the same street, she, in fact, met the person in question at the very spot she had dreamt of. So much for my theme. I will add only that no subsequent event proved the importance of this miraculous coincidence, which cannot therefore be accounted for by what lay in the future.

Analysis of the dream was helped by questioning, which established the fact that there was no evidence of her having had any recollection at all of the dream on the morning after she dreamt it, until after her walk – evidence such as her having written the dream down or told it to someone before it was fulfilled. On the contrary, she was obliged to accept the following account of what happened, which seems to me more plausible, without raising any objection to it. She was walking along the Kärntnerstrasse one morning and met her old family doctor in front of Hiess's shop. On seeing him she felt convinced that she had dreamt the night before of having this very meeting at that precise spot. According to the rules that apply to the interpretation [*Deutung*][T] of neurotic symptoms, her conviction must have been justified; its content may, however, need to be reinterpreted.

1 ['Eine erfüllte Traumahnung.' The manuscript of this paper is dated November 10, 1899 – six days after the publication of *The Interpretation of Dreams*. In the same letter to Fliess in which Freud announced that event (Freud, 1950*a*, Letter 123, of November 5, 1899) he remarked that he had just discovered the origin and meaning of premonitory dreams. The paper was first published posthumously in *GW*, **17** (1941), 21. The present English translation (by James Strachey, lightly revised for this edition) first appeared in *CP*, **5** (1950), 70. – The same incident was reported by Freud very much more briefly in his *Psychopathology of Everyday Life* (1901*b*), Chapter XII, Section D; *RSE*, **6**, 225 f. – The topic of premonitory dreams is touched upon in *The Interpretation of Dreams*, ibid., **4**, 57, and **5**, 555.]

2 [The principal shopping street in the centre of Vienna.]

The following is an episode with which Dr K. is connected from [624]
Frau B.'s earlier life. When she was young she was married, without her wholehearted consent, to an elderly but wealthy man. A few years later he lost his money, fell ill of tuberculosis and died. For many years the young woman supported herself and her sick husband by giving music lessons. Among her friends in misfortune was her family doctor, Dr K., who devoted himself to looking after her husband and helped her in finding her first pupils. Another friend was a barrister, also a Dr K., who put the chaotic affairs of the ruined merchant in order, while at the same time he made love to the young woman and – for the first and last time – set her passion aflame. This love affair brought her no real happiness, for the scruples created by her upbringing and her cast of mind interfered with her complete surrender while she was married and later when she was a widow. In the same connection in which she told me the dream, she also told me of a real occurrence dating from this unhappy period of her life, an occurrence which, in her opinion, was a remarkable coincidence. She was in her room, kneeling on the floor with her head buried in a chair and sobbing in passionate longing for her friend and helper the barrister, when at that very moment the door opened and in he came to visit her. We shall find nothing at all remarkable in this coincidence when we consider how often she thought of him and how often he probably visited her. Moreover, accidents which seem preconcerted like this are to be found in every love story. Nevertheless, this coincidence was probably the true content of her dream and the sole basis of her conviction that it had come true.

Between the scene in which her wish had been fulfilled and the time of the dream more than twenty-five years elapsed. In the meantime Frau B. had become the widow of a second husband who left her with a child and a fortune. The old lady's affection was still centred on Dr K., who was now her adviser and the administrator of her estate and whom she saw frequently. Let us suppose that during the few days before the dream she had been expecting a visit from him, but that this had not taken place – he was no longer so pressing as he used to be. She may then have quite well had a nostalgic dream one night which took her back to the old days. Her dream was probably of a rendezvous at the time of her love affair, and the chain of her dream thoughts carried her back to the [625]
occasion when, without any prearrangement, he had come in at the very moment at which she had been longing for him. She probably had dreams of this kind quite often now; they were a part of the belated punishment with which a woman pays for her youthful cruelty. But such

dreams – derivatives of a suppressed current of thought, filled with memories of rendezvous of which, since her second marriage, she no longer liked to think – such dreams were put aside on waking. And that was what happened to our ostensibly prophetic dream. She then went out, and in the Kärntnerstrasse, at a spot which was in itself indifferent, she met her old family doctor, Dr K. It was a very long time since she had seen him. He was intimately associated with the excitements [*Erregungen*] of that happy–unhappy time. He too had been a helper, and we may suppose that he had been used in her thoughts, and perhaps in her dreams as well, as a screen figure [*Deckperson*] behind which she concealed the better-loved figure of the other Dr K. This meeting now revived her recollection of the dream. She must have thought: 'Yes, I had a dream last night of my rendezvous with Dr K.' But this recollection had to undergo the distortion which the dream escaped only because it had been completely forgotten. She inserted the indifferent K. (who had reminded her of the dream) in place of the beloved K. The content of the dream – the rendezvous – was transferred [*überträgt*] to a belief that she had dreamt of that particular spot, for a rendezvous consists in two people coming to the same spot at the same time. And if she then had an impression that a dream had been fulfilled, she was only giving effect in that way to her memory of the scene in which she had longed in her misery for him to come and her longing had at once been fulfilled.

Thus the creation of a dream after the event [*nachträgliche*], which alone makes prophetic dreams possible, is nothing other than a form of censoring, thanks to which the dream is able to make its way through into consciousness.

10 Nov. 99

APPENDIX C

CHARACTERISTICS OF MY OWN DREAMS (TYPICAL DREAMS)[1]

I should like to distinguish between dreams with sensations and others. The first group includes flying, falling, floating and paralysis – the second is well known. Death of relatives, examinations, nakedness, Oedipus dreams, perhaps also dreams of money, dreams of travel and going through a series of rooms.

I hardly have any dreams with sensations. I do not recall [dreams of] flying or floating as being particularly common. In the past I often experienced falling dreams in a crude form, but now with the refinement of having to climb out of the window down the façade of the house to the street, making use of the projections of sills, etc., during which I experience a distressing, insidious feeling of falling.[2] Dreams of paralysis have become very rare indeed in the last few years, having been common but not very clear-cut in earlier years.

I have never had the Oedipus dream in an undisguised form, but I reported a disguised anxiety dream with this meaning in *The*

1 [*Meine individuelle Traumcharakteristik (Typische Träume)*. This undated manuscript, a photocopy of which is held in the Freud Collection of the Library of Congress in Washington DC, first came to light in 1989, when it was auctioned by Christie's (and partially reproduced in its catalogue dated June 21, 1989). It was published in complete form with comments by Ilse Grubrich-Simitis (1993, 144–6), and in an English translation by Philip Slotkin in Grubrich-Simitis (1996, 107–9) under the title 'My Individual Characterization of Dreams (Typical Dreams)'. The present translation by Mark Solms is a heavily revised version, more consistent with *RSE* style. – The purpose behind the compilation of this report on Freud's own typical dreams is obscure. However, internal evidence suggests that it must have been written some time after Freud's first visit to Rome (in the summer of 1901) and before he submitted his addenda for the 1909 edition of *The Interpretation of Dreams* (summer of 1908).]

2 [In the first edition of *The Interpretation of Dreams* Freud wrote about dreams of flying and falling that he had 'no experience of my own' of such dreams and that he had 'not experienced any dreams of the kind since I turned my attention to the subject of dream interpretation' (*RSE*, **4**, 241 and 242). Then, in 1909, the following entry appeared in the *Minutes* of the Vienna Psychoanalytical Society: 'Prof. Freud would like to call attention to a certain kind of dream, and ask everyone whether this dream is known to him and what is his interpretation of it. Usually, these dreams deal, in numerous variations, with *climbing down a smooth wall or the outside of a house*. The dream usually ends in a feeling of anxiety when the ground is about to be reached.' (*Minutes*, **2**, 170.) Some comments on the interpretation of such dreams were then added to *The Interpretation of Dreams* in 1911 (*RSE*, **5**, 317).]

Interpretation of Dreams.[1] I can recall only a single example of the dream of the death of living relatives.[2] Shortly after the birth of my youngest girl [Anna, 1895] I dreamt, without anxious affect, that her little predecessor [Sophie] was lying dead but rosy-cheeked in the cradle. In the analysis I remembered that as an eight-year-old boy, after the birth of my last sister (who corresponds in the sequence to my youngest daughter), I had crept up to the cradle in which her predecessor – who was then one year old – slept, rosy-cheeked, and thought: 'Now you are no longer the youngest'.

The dream of being naked was once very common with me and appeared in numerous interesting forms, even in military guise.[3] It too has disappeared in the last few years. I still had the exhibitionist inclination corresponding to it in the years of my puberty.[4] I look upon the difficulties which I encounter at times when I have something to publish as derivatives of this inclination – but so too is the compulsion to publish intimate things which ultimately breaks through.

The most familiar of the typical dreams for me is the examination dream, which made the usual progress from the matriculation examination [*Matura*] to the university finals [*Rigorosum*].[5] In the years recently past, during which I have had to struggle so much for recognition and have probably been deeply wounded by criticism, this dream has positively proliferated and given me an opportunity to attempt to interpret it. I still hold to the view that it appears in advance of anticipated and feared disgrace [cf. *RSE*, **4**, 243] but with the help of an idea the source of which I do not know, I have now come to understand it better and I conceive of it as a consolation in relation to the anticipatory anxiety.

That is, I have somewhere read the remark that examination dreams feature only those examinations which one has passed, never those in

1 [It is unclear what dream this refers to. There are only two explicit references to disguised Oedipus dreams in *The Interpretation of Dreams* (viz. the dream of the 'lynx or fox' (*RSE*, **4**, 229 f.) and 'a disguised Oedipus dream', ibid., **5**, 356 f. *n*.). The first of these was not dreamt by Freud himself, and the second, which was not an *anxiety* dream, was only included in 1925 (although it was published elsewhere many years earlier – see Freud, 1910*l*). Among the numerous other dreams that Freud might have had in mind here, his 'dream of the bird-beaked figures' (ibid., **5**, 521 f.) is perhaps a likely candidate.]

2 [Cf. ibid., **4**, 220 f.]

3 [Cf. ibid., **4**, 215: 'In the case of a man who has worn the Emperor's uniform, nakedness is often replaced with some breach of the dress regulations.']

4 [Cf. ibid., **4**, 217: 'dreams of being naked are dreams of exhibiting'.]

5 [Cf. *The Interpretation of Dreams*: 'Everyone who has passed the matriculation examination at the end of his school studies complains of the obstinacy with which he is pursued by anxiety dreams of having failed, or of being obliged to take the examination again, etc. In the case of those who have obtained a university degree this typical dream is replaced with another one which represents them as having failed in their university finals.' (Ibid., **4**, 243.)]

which one has failed.[1] This is true for me. I failed in Forensic Medicine, before the third final, but have never dreamt of this subject. The finals dream is usually about the preliminary examinations, botany and (a particular torment) zoology. In botany I was in trouble with Wiesner[2] because I could not recognize a single plant; then my good theoretical knowledge saved me. Before the zoology examination I wanted to bolt (for reasons of justified anxiety) but Claus, whom I met in the corridor, took me by the arm, urged me to stay, and gave me the questions which were bound to lead to my obtaining a distinction. A similar part was played by the history examination in the matriculation dream; I avoided trouble by a bold manoeuvre and passed the examination brilliantly. So the dream appears to console, in that it refers the current anxiety back to occasions in which the same anxiety proved to be unjustified. The wording of this consolation – 'What are you afraid of, then? You were afraid then too and yet today you are a doctor or a professor anyway!' – is misunderstood by the *Cs*. which regards it as a protest against the nonsense of the dream.

The dream of finding money is unknown to me. In earlier decades I frequently had travel dreams, in which the most wonderful landscapes stretched one after another; since I began to travel (1895)[3] they have become rare. I did not often see well-known landscapes or cities in dreams; *Rome* on one occasion – before I became acquainted with the city – based upon an engraving,[4] and Florence on another occasion, exactly as I had already seen it.[5]

Wandering through a suite of rooms occurs more frequently with me; but it has, to date, evaded interpretation.[6]

1 [In a 1909 addendum to *The Interpretation of Dreams*, where the anecdotes which follow are again recounted, Freud attributed this idea to a remark made by Wilhelm Stekel at a scientific meeting; cf. *RSE*, **4**, 243 and 244 *n*. 1.]

2 [Julius Wiesner (1838–1916) was Professor of Plant Anatomy and Physiology at the University of Vienna when Freud sat this examination (on June 9, 1880). Jones (1953, 63), however, says that Fleischl conducted the examination.]

3 [This refers to the date of Freud's first visit to Italy (Venice). His earlier travels are chronicled in Jones (1953, 198 f. and 364 f.).]

4 [Cf. the dream of 'a view of the Tiber' in *The Interpretation of Dreams* (*RSE*, **4**, 171).]

5 [Freud first visited Florence in 1896 and Rome in 1901.]

6 [In an addendum to *The Interpretation of Dreams* dated 1909, Freud remarked: 'A dream of going through a suite of rooms is a brothel or harem dream' (and further remarks on the interpretation of such dreams were added in 1914; cf. ibid., **5**, 316 f.).]

APPENDIX D

LIST OF WRITINGS BY FREUD DEALING PREDOMINANTLY OR LARGELY WITH DREAMS

[626] *It would scarcely be an exaggeration to say that dreams are alluded to in the majority of Freud's writings. The following list of works (of greatly varying importance) may, however, be of some practical use. The date at the beginning of each entry is that of the year during which the work in question was written. The date at the end is that of publication; and under that date fuller particulars of the work can be found in the Bibliography. The items in square brackets were published posthumously.*

[1895 'Project for a Scientific Psychology' (Sections 19, 20 and 21 of Part I). (1950*a*.)]
1899 *The Interpretation of Dreams*. (1900*a*.)
[1899 'A Premonitory Dream Fulfilled.' (1941*c*.)]
1901 *On Dreams*. (1901*a*.)
1901 'Fragment of an Analysis of a Case of Hysteria.' [Original title: 'Dreams and Hysteria.'] (1905*e*.)
1905 *Jokes and their Relation to the Unconscious* (Chapter VI). (1905*c*.)
1906 *Delusions and Dreams in Jensen's 'Gradiva'*. (1907*a*.)
[c. 1908 'Characterization of My Own Dreams (Typical Dreams).' (1989*f*.)]
1910 'A Typical Example of a Disguised Oedipus Dream.' (1910*l*.)
1911 'Additions to the Interpretation of Dreams.' (1911*a*.)
1911 'The Handling of Dream Interpretation in Psychoanalysis.' (1911*e*.)
1911 'Dreams in Folklore' (with E. Oppenheim). (1958*a*.)
1913 'An Evidential Dream.' (1913*a*.)
1913 'The Occurrence in Dreams of Material from Fairy Tales.' (1913*d*.)
1913 'Observations and Examples from Analytic Practice.' (1913*h*.)
[627] 1914 'A "Great Achievement" in a Dream.' (1914*e*.)
1914 'From the History of an Infantile Neurosis' (Section IV). (1918*b*.)
1915 'A Metapsychological Supplement to the Theory of Dreams.' (1916–17*f*.)
1916 *Introductory Lectures on Psychoanalysis* (Part II). (1916–17*a*.)
1920 'Supplements to the Theory of Dreams.' (1920*f*.)
1922 'Dreams and Telepathy.' (1922*a*.)
1923 'Remarks upon the Theory and Practice of Dream Interpretation.' (1923*c*.)
1923 'Josef Popper-Lynkeus and the Theory of Dreams.' (1923*f*.)
1925 'Some Additional Notes on Dream Interpretation as a Whole.' (1925*i*.)
1929 'Some Dreams of Descartes': A Letter to Maxime Leroy.' (1929*b*.)
1932 'My Contact with Josef Popper-Lynkeus.' (1932*c*.)
1932 *New Introductory Lectures on Psychoanalysis* (Lectures XXIX and XXX). (1933*a*.)
[1938 *An Outline of Psychoanalysis* (Chapter V). (1940*a*.)]

ON DREAMS

(1901)

EDITORS' NOTE

ÜBER DEN TRAUM

GERMAN EDITIONS

1901 *Über den Traum*. First published as part (pp. 307–44) of a serial publication, *Grenzfragen des Nerven- und Seelenlebens*, edited by L. Löwenfeld and H. Kurella. Wiesbaden: Bergmann. [631]

1911 2nd ed. (Issued as a separate brochure, enlarged.) Same publishers. Pp. 44.

1921 3rd ed. Munich and Wiesbaden: Bergmann. Pp. 44.

1925 In Freud's *Gesammelte Schriften*, **3**, 189–256. Leipzig, Vienna and Zürich: Internationaler Psychoanalytischer Verlag.

1931 In Freud's collective volume *Kleine Schriften zur Sexualtheorie und Traumlehre*, 246–307. Same publishers.

1942 In Freud's *Gesammelte Werke*, **2** and **3**, 643–700. London: Imago Publishing Co.

ENGLISH TRANSLATIONS

1914 By M. D. Eder (with introduction by W. L. Mackenzie). London: Heinemann. New York: Rebman. Pp. xxxii + 110.

1952 By James Strachey. London: Hogarth Press and Institute of Psycho-Analysis. Pp. viii + 80. New York: Norton. Pp. 120.

1953 In *SE*, **5**. (Revised reprint of the one published in 1952).

The present translation is a revised and corrected reprint of the one first published in 1952.

Only three or four months after the publication of *The Interpretation of Dreams* the notion of writing a shortened version of his book was already in Freud's mind. Fliess had evidently written to suggest something of the sort, for in a letter of April 4, 1900 (Freud, 1950*a*, Letter 132), Freud rejected the proposal on the ground, among others, that he had 'already promised to let Löwenfeld have an essay of the same kind'. He also commented on his distaste for embarking on such a job so soon after finishing the large book. Evidently this reluctance persisted, for on May 20 (ibid., Letter 136) [632] he mentions that he has not even *started* the 'brochure', and on July 10 (ibid., Letter 138) announces that he has put it off till October. His last reference to it in the Fliess correspondence is on October 14, 1900 (ibid., Letter 139), where he remarks that he is

writing the essay 'without any real enjoyment', since his mind is full of material for *The Psychopathology of Everyday Life* (which was to be his next production). In this latter work, incidentally, there is a reference (near the end of Chapter VII) to the essay *On Dreams* and to the question of whether the issue of a résumé might interfere with the sales of the big book.

As will be seen, the only addition of importance made by Freud in the later issues of the essay was the section on symbolism introduced into the second edition.

ON DREAMS

I

During the epoch which may be described as prescientific, men had no [633]
difficulty in finding an explanation of dreams. When they remembered a dream after waking up, they regarded it as either a favourable or a hostile manifestation by higher powers, demonic and divine. When modes of thought belonging to natural science began to flourish, all this ingenious mythology was transformed into psychology, and today only a small minority of educated people doubt that dreams are a product of the dreamer's own mind.

Since the rejection of the mythological hypothesis, however, dreams have stood in need of explanation. The conditions of their origin, their relation to waking mental life, their dependence upon stimuli which force their way upon perception during the state of sleep, the many peculiarities of their content which are repugnant to waking thought, the inconsistency between their ideational images [*Vorstellungsbildern*][T] and *Vorstellung*
the affects attaching to them, and lastly their transitory character, the manner in which waking thought pushes them on one side as something alien to it, and mutilates or extinguishes them in memory – all of these and other problems besides have been awaiting clarification for many hundreds of years, and till now no satisfactory solution to them has been advanced. But what stands in the foreground of our interest is the question of the *significance* [*Bedeutung*] of dreams, a question which bears a double sense. It enquires in the first place as to the psychical significance of dreaming, as to the relation of dreams to other mental processes, and as to any biological function that they may have; in the second place it seeks to discover whether dreams can be interpreted [*deutbar ist*], whether the content of individual dreams has a 'meaning' [*Sinn*], such as we are accustomed to find in other psychical structures.

In the assessment of the significance of dreams three lines of thought can be distinguished. One of these, which echoes, as it were, the ancient

overvaluation of dreams, is expressed in the writings of certain philosophers. They consider that the basis of dream life is a peculiar state of
[634] mental activity, and even go so far as to acclaim that state as an elevation to a higher level. For instance, Schubert [1814] declares that dreams are a liberation of the spirit from the power of external nature, and a freeing of the soul from the bonds of the senses. Other thinkers, without going so far as this, insist nevertheless that dreams arise essentially from mental impulses and represent manifestations of mental forces which have been prevented from expanding freely during the daytime. (Cf. the 'dream imagination' of Scherner [1861, 97 f.] and Volkelt [1875, 28 f.].) A large number of observers agree in attributing to dream life a capacity for superior functioning in certain departments at least (e.g. in memory).

In sharp contrast to this, the majority of medical writers adopt a view according to which dreams scarcely reach the level of being psychical phenomena at all. On their theory, the sole instigators of dreams are the sensory and somatic stimuli which either impinge upon the sleeper from outside or become active accidentally in his internal organs. What is dreamt, they contend, has no more claim to sense and meaning than, for instance, the sounds which would be produced if 'the ten fingers of a man who knows nothing of music were wandering over the keys of a piano'. [Strümpell, 1877, 84.] Dreams are described by Binz [1878, 35] as being no more than 'somatic processes which are in every case useless and in many cases positively pathological'. All the characteristics of dream life would thus be explained as being due to the disconnected activity of separate organs or groups of cells in an otherwise sleeping brain, an activity forced upon them by physiological stimuli.

Popular opinion is but little affected by this scientific judgement, and is not concerned as to the sources of dreams; it seems to persist in the belief that nevertheless dreams have a meaning, which relates to the prediction of the future and which can be discovered by some process of interpretation of a content which is often confused and puzzling. The methods of interpretation employed consist in transforming the content of the dream as it is remembered, either by replacing it piecemeal in accordance with a fixed key, or by replacing the dream as a whole by another whole to which it stands in a symbolic relation. Serious-minded people smile at these efforts: '*Träume sind Schäume*' – 'dreams are froth'.

II

One day I discovered to my great astonishment that the view of dreams [635]
which came nearest to the truth was not the medical but the popular one, half-involved though it still was in superstition. For I had been led to fresh conclusions on the subject of dreams by applying to them a new method of psychological investigation which had done excellent service in the solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psychoanalysis', it has found acceptance by a whole school of research workers. The numerous analogies that exist between dream life and a great variety of conditions of psychical illness in waking life have indeed been correctly observed by many medical investigators. There seemed, therefore, good ground for hoping that a method of investigation which had given satisfactory results in the case of psychopathic structures would also be of use in throwing light upon dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to waking consciousness; their origin is as unknown to consciousness as that of dreams. In the case of these psychopathic structures practical considerations led to an investigation of their origin and mode of development; for experience had shown that the discovery of the trains of thought which, concealed from consciousness, connect the pathological ideas with the remaining contents of the mind is equivalent to a resolution of the symptoms and has as its consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy was the starting point of the procedure of which I made use for the explanation of dreams.

This procedure is easily described, although instruction and practice would be necessary before it could be put into effect.

If we make use of it on someone else, let us say on a patient with a phobia, we require him to direct his attention on to the idea in question, not, however, to reflect upon it as he has done so often already, but to take notice of *whatever occurs to his mind without any exception* and report it to the physician. If he should then assert that his attention is unable to grasp anything at all, we dismiss this with an energetic assurance that a complete absence of any ideational subject matter is quite impossible. And in fact very soon numerous ideas will occur to him and [636]
will lead on to others; but they will invariably be prefaced by a judgement on the part of the self-observer to the effect that they are senseless or unimportant, that they are irrelevant, and that they occurred to him by chance and without any connection with the topic under

consideration. We perceive at once that it was this critical attitude which prevented the subject from reporting any of these ideas, and which indeed had previously prevented them from becoming conscious. If we can induce him to abandon his criticism of the ideas that occur to him, and to continue pursuing the trains of thought which will emerge so long as he keeps his attention turned upon them, we find ourselves in possession of a quantity of psychical material, which we soon find is clearly connected with the pathological idea which was our starting point; this material will soon reveal connections between the pathological idea and other ideas, and will eventually enable us to replace the pathological idea with a new one which fits into the nexus of thought in an intelligible fashion.

This is not the place in which to give a detailed account of the premises upon which this experiment was based, or the consequences which follow from its invariable success. It will therefore be enough to say that we obtain material that enables us to resolve any pathological idea if we turn our attention precisely to those associations which are 'involuntary', which 'interfere with our reflection', and which are normally dismissed by our critical faculty as worthless rubbish.

If we make use of this procedure upon *ourselves*, we can best assist the investigation by at once writing down what are at first unintelligible associations.

I will now show what results follow if I apply this method of investigation to dreams. Any example of a dream should in fact be equally appropriate for the purpose; but for particular reasons I will choose some dream of my own, one which seems obscure and meaningless as I remember it, and one which has the advantage of brevity. A dream which I actually had last night will perhaps meet these requirements. Its content, as I noted it down immediately after waking up, was as follows:

'*Company at table or table d'hôte . . . spinach was being eaten . . . Frau E. L. was sitting beside me; she was turning her whole attention to me and laid her hand on my knee in an intimate manner. I* [637] *removed her hand unresponsively. She then said: "But you've always had such beautiful eyes." . . . I then had an indistinct picture of two eyes, as though it were a drawing or like the outline of a pair of spectacles. . . .*'

This was the whole of the dream, or at least all that I could remember of it. It seemed to me obscure and meaningless, but above all surprising. Frau E. L. is a person with whom I have hardly at any time been on friendly terms, nor, so far as I know, have I ever wished to have any closer relations with her. I have not seen her for a long time, and her name has

not, I believe, been mentioned during the last few days. The dream process was not accompanied by affects of any kind.

Reflecting over this dream brought me no nearer to understanding it. I determined, however, to set down without any premeditation or criticism the associations which presented themselves to my self-observation. As I have found, it is advisable for this purpose to divide a dream into its elements and to find the associations attaching to each of these fragments separately.

Company at table or table d'hôte. This at once reminded me of an episode which occurred late yesterday evening. I came away from a small party in the company of a friend who offered to take a cab and drive me home in it. 'I prefer taking a cab with a taximeter,' he said, 'it occupies one's mind so agreeably; one always has something to look at.' When we had taken our places in the cab and the driver had set the dial, so that the first charge of sixty hellers became visible, I carried the joke further. 'We've only just got in', I said, 'and already we owe him sixty hellers. A cab with a taximeter always reminds me of a table d'hôte. It makes me avaricious and selfish, because it keeps on reminding me of what I owe. My debt seems to be growing too fast, and I'm afraid of getting the worst of the bargain; and in just the same way at a table d'hôte I can't avoid feeling in a comic way that I'm getting too little, and must keep an eye on my own interests.' I went on to quote, somewhat discursively:

> Ihr führt ins Leben uns hinein,
> Ihr lasst den Armen schuldig werden.[1]

And now a second association to 'table d'hôte'. A few weeks ago, while [638]
we were at table in a hotel at a mountain resort in the Tyrol, I was very much annoyed because I thought my wife was not being sufficiently reserved towards some people sitting near us whose acquaintance I had no desire at all to make.[2] I asked her to concern herself more with me than with these strangers. This was again *as though I were getting the worst of the bargain at the table d'hôte*. I was struck too by the contrast

1 [These lines are from one of the Harp-player's songs in Goethe's *Wilhelm Meister*. In the original the words are addressed to the Heavenly Powers and may be translated literally: 'You lead us into life, you make the poor creature guilty.' But the words '*Armen*' and '*schuldig*' are both capable of bearing another meaning. '*Armen*' might mean 'poor' in the financial sense and '*schuldig*' might mean 'in debt'. So in the present context the last line could be rendered: 'You make the poor man fall into debt.' – The lines were quoted again by Freud in Chapter VII of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 120.]

2 [The episode is also referred to in *The Psychopathology of Everyday Life* (1901*b*), Chapter VII (A); ibid., **6**, 119.]

between my wife's behaviour at table and that of Frau E. L. in the dream, who 'turned her whole attention to me'.

To proceed. I now saw that the events in the dream were a reproduction of a small episode of a very similar kind which occurred between my wife and me at the time at which I was secretly courting her. The caress which she gave me under the tablecloth was her reply to a pressing love letter. In the dream, however, my wife was replaced by a comparative stranger – E. L.

Frau E. L. is the daughter of a man to whom I was once *in debt*. I could not help noticing that this revealed an unsuspected connection between parts of the content of the dream and my associations. If one follows the train of association starting out from one element of a dream's content, one is soon brought back to another of its elements. My associations to the dream were bringing to light connections which were not visible in the dream itself.

If a person expects one to keep an eye on his interests without any advantage to oneself, his artlessness is apt to provoke the scornful question: 'Do you suppose I'm going to do this or that for the sake of your *beaux yeux* [*beautiful eyes*]?' That being so, Frau E. L.'s speech in the dream, 'You've always had such beautiful eyes', can only have meant: 'People have always done everything for you for love; you have always had everything *without paying for it*.' The truth is, of course, just the contrary: I have always paid dearly for whatever advantage I have had
[639] from other people. The fact that my friend took me home yesterday in a cab *without my paying for it* must, after all, have made an impression on me.

Incidentally, the friend whose guests we were yesterday has often put me in his debt. Only recently I allowed an opportunity of repaying him to slip by. He has had only one present from me – an antique bowl, round which there are *eyes* painted: what is known as an '*occhiale*', to avert the *evil eye*. Moreover, he is an *eye surgeon*. The same evening I asked him after a woman patient, whom I had sent on to him for a consultation to fit her with *spectacles*.

As I now perceived, almost all the elements of the dream's content had been brought into the new context. For the sake of consistency, however, the further question might be asked of why *spinach*, of all things, was being served in the dream. The answer was that *spinach* reminded me of an episode which occurred not long ago at our family table, when one of the children – and precisely the one who really deserves to be admired for his *beautiful eyes* – refused to eat any

spinach. I myself behaved in just the same way when I was a child; for a long time I detested spinach, till eventually my taste changed and promoted that vegetable into one of my favourite foods. My own early life and my child's were thus brought together by the mention of this dish. 'You ought to be glad to have spinach,' the little gourmet's mother exclaimed; 'there are children who would be only too pleased to have spinach.' Thus I was reminded of the duties of parents to their children. Goethe's words

> Ihr führt ins Leben uns hinein,
> Ihr lasst den Armen schuldig werden

gained a fresh meaning in this connection.[1]

I will pause here to survey the results I had so far reached in my dream analysis. By following the associations which arose from the separate elements of the dream divorced from their context, I arrived at a number of thoughts and recollections, which I could not fail to recognize as important products of my mental life. This material revealed by the analysis of the dream was intimately connected with the dream's content, yet the connection was of such a kind that I could never have inferred the fresh material from that content. The dream was unemo- [640]
tional, disconnected and unintelligible; but while I was producing the thoughts behind the dream, I was aware of intense and well-founded affective impulses; the thoughts themselves fell at once into logical chains, in which certain central ideas made their appearance more than once. Thus, the contrast between 'selfish' and 'unselfish', and the elements 'being in debt' and 'without paying for it' were central ideas of this kind, not represented in the dream itself. I might draw closer together the threads in the material revealed by the analysis, and I might then show that they converge upon a single nodal point, but considerations of a personal and not of a scientific nature prevent my doing so in public. I should be obliged to betray many things which had better remain my secret, for on my way to discovering the solution of the dream all kinds of things were revealed which I was unwilling to admit even to myself. Why then, it will be asked, have I not chosen some other dream, whose analysis is better suited for reporting, so that I could produce more convincing evidence of the meaning and connectedness of the material uncovered by analysis? The answer is that *every* dream with which I

1 [See footnote 1, p. 577 above. The first line of the couplet might now be taken to mean that the verses are addressed to parents.]

might try to deal would lead to things equally hard to report and would impose an equal discretion upon me. Nor should I avoid this difficulty by bringing up someone else's dream for analysis, unless circumstances enabled me to drop all disguise without damage to the person who had confided in me.

At the point which I have now reached, I am led to regard the dream as a sort of *substitute* for the thought processes, full of meaning and emotion, at which I arrived after the completion of the analysis. We do not yet know the nature of the process which has caused the dream to be generated from these thoughts, but we can see that it is wrong to regard it as purely physical and without psychical meaning, as a process which has arisen from the isolated activity of separate groups of brain cells aroused from sleep.

Two other things are already clear. The content of the dream is very much shorter than the thoughts for which I regard it as a substitute; and analysis has revealed that the instigator of the dream was an unimportant event of the evening before I dreamt it.

I should, of course, not draw such far-reaching conclusions if only a
[641] single dream analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from *any* dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream reappear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the '*manifest* content of the dream' and the latter – without, in the first instance, making any further distinction – as the '*latent* content of the dream'. I am now faced with two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work'. The counterpart to this activity – one which brings about a transformation in the opposite direction – is already known to us as the work of analysis. The remaining problems arising out of dreams – questions as to the instigators of dreams, as to the origin of their material, as

to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten – all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream content. Since I attribute all the contradictory and incorrect views upon dream life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the *manifest dream* with the *latent dream thoughts*.

III

The transformation of the latent dream thoughts into the manifest dream content deserves all our attention, since it is the first instance known to us of psychical material being changed over from one mode of expression to another, from a mode of expression which is immediately intelligible to us to another which we can only come to understand with the help of guidance and effort, though it too must be recognized as a function of our mental activity. [642]

Dreams can be divided into three categories in respect of the relation between their latent and manifest content. In the first place, we may distinguish those dreams which *make sense* and are at the same time *intelligible*, which, that is to say, can be inserted without further difficulty into the context of our mental life. We have numbers of such dreams. They are for the most part short and appear to us in general to deserve little attention, since there is nothing astonishing or strange about them. Incidentally, their occurrence constitutes a powerful argument against the theory according to which dreams originate from the isolated activity of separate groups of brain cells. They give no indication of reduced or fragmentary psychical activity, but nevertheless we never question the fact of their being dreams, and do not confuse them with the products of waking life. A second group is formed by those dreams which, though they are connected in themselves and have a clear sense, nevertheless have a *bewildering* effect, because we cannot see how to fit that sense into our mental life. Such would be the case if we were to dream, for instance, that a relative of whom we were fond had died of the plague, when we had no reason for expecting, fearing or assuming any such thing; we should ask in astonishment: 'How did I get hold of such an idea?' The third group, finally, contains those dreams which are without either sense or intelligibility, which seem *disconnected*, *confused* and *meaningless*. The preponderant majority of the products of our dreaming exhibit

these characteristics, which are the basis of the low opinion in which dreams are held and of the medical theory that they are the outcome of a restricted mental activity. The most evident signs of incoherence are
[643] seldom absent, especially in dream compositions of any considerable length and complexity.

The contrast between the manifest and latent content of dreams is clearly of significance only for dreams of the second and more particularly of the third category. It is there that we are faced with riddles which only disappear after we have replaced the manifest dream by the latent thoughts behind it; and it was on a specimen of the last category – a confused and unintelligible dream – that the analysis which I have just recorded was carried out. Contrary to our expectation, however, we came up against motives which prevented us from becoming fully acquainted with the latent dream thoughts. A repetition of similar experiences may lead us to suspect that *there is an intimate and regular relation between the unintelligible and confused nature of dreams and the difficulty of reporting the thoughts behind them*. Before enquiring into the nature of this relation, we may with advantage turn our attention to the more easily intelligible dreams of the first category, in which the manifest and latent content coincide, and there appears to be a consequent saving in dream-work.

Moreover, an examination of these dreams offers advantages from another standpoint. For *children's* dreams are of that kind – significant and not puzzling. Here, incidentally, we have a further argument against tracing the origin of dreams to dissociated cerebral activity during sleep. For why should a reduction in psychical functioning of this kind be a characteristic of the state of sleep in the case of adults but not in that of children? On the other hand, we shall be fully justified in expecting that an explanation of psychical processes in children, in whom they may well be greatly simplified, may turn out to be an indispensable prelude to the investigation of the psychology of adults.

I will therefore record a few instances of dreams which I have collected from children. A little girl nineteen months old had been kept without food all day because she had had an attack of vomiting in the morning; her nurse declared that she had been upset by eating strawberries. During the night after this day of starvation she was heard saying her own name in her sleep and adding: '*Stwawbewwies, wild stwawbewwies, omblet, pudden!*' She was thus dreaming of eating a meal, and she laid
[644] special stress in her menu on the particular delicacy of which, as she had reason to expect, she would only be allowed scanty quantities in the near

future. – A little boy of twenty-two months had a similar dream of a feast which he had been denied. The day before, he had been obliged to present his uncle with a gift of a basket of fresh cherries, of which he himself, of course, had only been allowed to taste a single sample. He awoke with this cheerful news: '*Hermann eaten all the chewwies!*' One day a girl of three and a quarter made a trip across a lake. The voyage was evidently not long enough for her, for she cried when she had to get off the boat. Next morning she reported that during the night she had been for a trip on the lake: she had been continuing her interrupted voyage. – A boy of five and a quarter showed signs of dissatisfaction in the course of a walk in the neighbourhood of the Dachstein.[1] Each time a new mountain came into view he asked if it was the Dachstein and finally refused to visit a waterfall with the rest of the company. His behaviour was attributed to fatigue; but it found a better explanation when next morning he reported that he had dreamt that *he had climbed up the Dachstein*. He had evidently had the idea that the expedition would end in a climb up the Dachstein, and had become depressed when the promised mountain never came in view. He made up in his dream for what the previous day had failed to give him. – A six-year-old girl[2] had a very similar dream. In the course of a walk her father had stopped short of their intended goal as the hour was getting late. On their way back she had noticed a signpost bearing the name of another landmark; and her father had promised to take her there as well another time. Next morning she met her father with the news that she had dreamt that *he had been with her to both places*.

The common element in all these children's dreams is obvious. All of them fulfilled wishes which were active during the day but had remained unfulfilled. The dreams were simple and undisguised *wish fulfilments*.

Here is another child's dream, which, though at first sight it is not quite easy to understand, is also nothing more than a wish fulfilment. A little girl not quite four years old had been brought to town from the country because she was suffering from an attack of poliomyelitis. She spent the [645]
night with an aunt who had no children, and was put to sleep in a large bed – much too large for her, of course. Next morning she said she had had a dream that *the bed had been far too small for her, and that there had been no room for her in it*. It is easy to recognize this dream as a wishful dream if we remember that children very often express a wish '*to be big*'.

1 [A mountain in the Austrian Alps.]

2 [In *The Interpretation of Dreams*, where the same dream is reported (*RSE*, **4**, 115), the girl's age is twice given as 'eight'.]

The size of the bed was a disagreeable reminder of her smallness to the would-be big child; she therefore corrected the unwelcome relation in her dream, and grew so big that even the large bed was too small for her.

Even when the content of children's dreams becomes complicated and subtle, there is never any difficulty in recognizing them as wish fulfilments. An eight-year-old boy had a dream that he was driving in a chariot with Achilles and that Diomede was the charioteer. It was shown that the day before he had been deep in a book of legends about the Greek heroes; and it was easy to see that he had taken the heroes as his models and was sorry not to be living in their days.[1]

This small collection throws a direct light on a further characteristic of children's dreams: their connection with daytime life. The wishes which are fulfilled in them are carried over from daytime and as a rule from the day before, and in waking life they have been accompanied by intense emotion. Nothing unimportant or indifferent, or nothing which would strike a child as such, finds its way into the content of their dreams.

Numerous examples of dreams of this infantile type can be found occurring in adults as well, though, as I have said, they are usually brief in content. Thus a number of people regularly respond to a stimulus of thirst during the night with dreams of drinking, which thus endeavour to get rid of the stimulus and enable sleep to continue. In some people 'dreams of convenience' of this kind often occur before waking, when the necessity for getting up presents itself. They dream that they are already up and at the washing-stand, or that they are already at the school or office where they are due at some particular time. During the night before a journey we not infrequently dream of having arrived at our destination; so too, before a visit to the theatre or a party, a dream
[646] will often anticipate the pleasure that lies ahead – out of impatience, as it were. In other dreams the wish fulfilment is expressed a stage more indirectly: some connection or implication must be established – that is, the work of interpretation must be begun – before the wish fulfilment can be recognized. A man told me, for instance, that his young wife had had a dream that her period had started. I reflected that if this young woman had missed her period she must have known that she was faced with a pregnancy. Thus when she reported her dream she was announcing her pregnancy, and the meaning of the dream was to represent as fulfilled her wish that the pregnancy might be postponed for a while. Under unusual or extreme conditions dreams of this infantile character

1 [Most of these children's dreams can be found reported in greater detail in *The Interpretation of Dreams* (1900*a*), Chapter III; *RSE*, **4**, 113 ff., and in the eighth of Freud's *Introductory Lectures* (1916–17*a*), ibid., **15**, 110 ff.]

are particularly common. Thus the leader of a polar expedition has recorded that the members of his expedition, while they were wintering in the ice-field and living on a monotonous diet and short rations, regularly dreamt like children of large meals, of mountains of tobacco, and of being back at home.[1]

It by no means rarely happens that in the course of a comparatively long, complicated and on the whole confused dream one particularly clear portion stands out, which contains an unmistakable wish fulfilment, but which is bound up with some other, unintelligible material. But in the case of adults, anyone with some experience in analysing their dreams will find to his surprise that even those dreams which have an appearance of being transparently clear[2] are seldom as simple as those of children, and that behind the obvious wish fulfilment some other meaning may lie concealed.

It would indeed be a simple and satisfactory solution to the riddle of dreams if the work of analysis were to enable us to trace even the meaningless and confused dreams of adults back to the infantile type of fulfilment of an intensely felt wish of the previous day. There can be no doubt, however, that appearances do not speak in favour of such an expectation. Dreams are usually full of the most indifferent and strangest material, and there is no sign in their content of the fulfilment of any wish.

But before taking leave of infantile dreams with their undisguised wish fulfilments, I must not omit to mention one principal feature of dreams, which has long been evident and which emerges particularly clearly precisely in this group. Every one of these dreams can be replaced by an optative clause: 'Oh, if only the trip on the lake had lasted longer!' – 'If only I were already washed and dressed!' – 'If only I could have kept the cherries instead of giving them to Uncle!' But dreams give us more than such optative clauses. They show us the wish as already fulfilled; they represent its fulfilment as real and present; and the material employed in dream representation consists principally, though not exclusively, of situations and of sensory images, mostly of a visual character. Thus, even in this infantile group, a species of transformation, which deserves to be described as dream-work, is not completely absent: *a thought expressed in the optative has been replaced by a representation in the present tense*. [647]

1 [Quoted in full from 1911 onwards in *The Interpretation of Dreams* (*RSE*, **4**, 117 *n*. 1). – The last two sentences of this paragraph were added in 1911.]

2 ['*durchsichtigen*.' So in the first edition. In the second and subsequent editions misprinted '*undurchsichtigen*'.]

IV

[648] We shall be inclined to suppose that a transformation of some such kind has occurred even in confused dreams, though we cannot tell whether what has been transformed was an optative in their case too. There are, however, two passages in the specimen dream which I have reported, and with whose analysis we have made some headway, that give us reason to suspect something of the kind. The analysis showed that my wife had concerned herself with some other people at table, and that I had found this disagreeable; the dream contained precisely the opposite of this – the person who took the place of my wife was turning her whole attention to me. But a disagreeable experience can give rise to no more suitable wish than that its opposite might have occurred – which was what the dream represented as fulfilled. There was a very similar relation between the bitter thought revealed in the analysis that I had never had anything free of cost and the remark made by the woman in the dream – 'You've always had such beautiful eyes'. Some part of the opposition between the manifest and latent content of dreams is thus attributable to wish fulfilment.

But another achievement of the dream-work, tending as it does to produce incoherent dreams, is even more striking. If in any particular instance we compare the number of ideational elements or the space taken up in writing them down in the case of the dream and of the dream thoughts to which the analysis leads us and of which traces are to be found in the dream itself, we shall be left in no doubt that the dream-work has carried out a work of compression or *condensation* [*Verdichtung*][T] on a large scale. It is impossible at first to form any judgement of the degree of this condensation; but the deeper we plunge into a dream analysis the more impressive it seems. From every element in a dream's content associative threads branch out in two or more directions; every situation in a dream seems to be put together out of two or more impressions or experiences. For instance, I once had a dream of a sort of swimming pool, in which the bathers were scattering in all directions; at one point on the edge of the pool someone was standing and bending towards one of the people bathing, as though to help her out of
[649] the water. The situation was put together from a memory of an experience I had had at puberty and from two paintings, one of which I had seen shortly before the dream. One was a picture from Schwind's series illustrating the legend of Mélusine, which showed the water-nymphs surprised in their pool (cf. the scattering bathers in the dreams); the

other was a picture of the Deluge by an Italian Master; while the little experience remembered from my puberty was of having seen the instructor at a swimming school helping a lady out of the water who had stopped in until after the time set aside for men bathers. – In the case of the example which I chose for interpretation, an analysis of the situation led me to a small series of recollections each of which contributed something to the content of the dream. In the first place, there was the episode from the time of my engagement of which I have already spoken. The pressure upon my hand under the table, which was a part of that episode, provided the dream with the detail 'under the table' – a detail which I had to add as an afterthought [*nachträglich*] to my memory of the dream. In the episode itself there was of course no question of 'turning to me'; the analysis showed that this element was the fulfilment of a wish by presenting the opposite of an actual event, and that it related to my wife's behaviour at the table d'hôte. But behind this recent recollection there lay concealed a very similar and far more important scene from the time of our engagement, which estranged us for a whole day. The intimate laying of a hand on my knee belonged to a quite different context and was concerned with quite other people. This element in the dream was in turn the starting point of two separate sets of memories – and so on.

The material in the dream thoughts which is packed together for the purpose of constructing a dream situation must of course in itself be adaptable for that purpose. There must be one or more *common elements* in all the components. The dream-work then proceeds just as Francis Galton did in constructing his family photographs. It superimposes, as it were, the different components upon one another. The common element in them then stands out clearly in the composite picture, while contradictory details more or less wipe one another out. This method of production also explains to some extent the varying degrees of characteristic vagueness shown by so many elements in the content of dreams. Basing itself on this discovery, dream interpretation has laid [650]
down the following rule: in analysing a dream, if an uncertainty can be resolved into an 'either–or', we must replace it for purposes of interpretation by an 'and', and take each of the apparent alternatives as an independent starting point for a series of associations.

If a common element of this kind between the dream thoughts is not present, the dream-work sets about *creating* one, so that it may be possible for the thoughts to be given a common representation in the dream. The most convenient way of bringing together two dream thoughts

which, to start with, have nothing in common is to alter the verbal form of one of them, and thus bring it halfway to meet the other, which may be similarly clothed in a new form of words. A parallel process is involved in hammering out a rhyme, where a similar sound has to be sought in the same way as a common element is in our present case. A large part of the dream-work consists in the creation of intermediate thoughts of this kind which are often highly ingenious, though they frequently appear far-fetched; these then form a link between the composite picture in the manifest content of the dream and the dream thoughts, which are themselves diverse both in form and essence and have been determined by the exciting factors of the dream. The analysis of our sample dream affords us an instance of this kind in which a thought has been given a new form in order to bring it into contact with another which is essentially foreign to it. In carrying out the analysis I came upon the following thought: '*I should like to get something sometimes without paying for it*.' But in that form the thought could not be employed in the dream content. It was therefore given a fresh form: '*I should like to get some enjoyment without cost* ["*Kosten*"].'[1] Now the word '*Kosten*' in its second sense fits into the 'table d'hôte' circle of ideas, and could thus be represented in the '*spinach*' which was served in the dream. When a dish appears at our table and the children refuse it, their mother begins by trying persuasion, and urges them '*just to taste* ["*kosten*"] *a bit of it*'. It may seem strange that the dream-work should make such free use of verbal ambiguity, but further experience will teach us that the occurrence is quite a common one.

[651] The process of condensation further explains certain constituents of the content of dreams which are peculiar to them and are not found in waking ideation. What I have in mind are 'collective' and 'composite figures' and the strange 'composite structures', which are creations not unlike the composite animals invented by the folk imagination of the Orient. The latter, however, have already assumed stereotyped shapes in our thought, whereas in dreams fresh composite forms are being perpetually constructed in an inexhaustible variety. We are all of us familiar with such structures from our own dreams.

There are many sorts of ways in which figures of this kind can be put together. I may build up a figure by giving it the features of two people; or I may give it the *form* of one person but think of it in the dream as having the *name* of another person; or I may have a visual picture of one person, but put it in a situation which is appropriate to another. In all

1 [The German word '*Kosten*' means both 'cost' and 'to taste'.]

these cases the combination of different persons into a single representative in the content of the dream has a meaning; it is intended to indicate an 'and' or 'just as', or to compare the original persons with each other in some particular respect, which may even be specified in the dream itself. As a rule, however, this common element between the combined persons can only be discovered by analysis, and is only indicated in the content of the dream by the formation of the collective figure.

The composite structures which occur in dreams in such immense numbers are put together in an equal variety of ways, and the same rules apply to their resolution. There is no need for me to quote any instances. Their strangeness disappears completely when once we have made up our minds not to class them with the objects of our waking perception, but to remember that they are products of dream condensation and are emphasizing in an effectively abbreviated form some common characteristic of the objects which they are thus combining. Here again the common element has as a rule to be discovered by analysis. The content of the dream merely says as it were: 'All these things have an element *x* in common.' The dissection of these composite structures by means of analysis is often the shortest way to finding the meaning of a dream. – Thus, I dreamt on one occasion that I was sitting on a bench with one of my former university teachers, and that the bench, which was surrounded by other benches, was moving forward at a rapid pace. This was a combination of a lecture theatre and a *trottoir roulant*.[1] I will not pursue this [652]
train of ideas further. – Another time I was sitting in a railway carriage and holding on my lap an object in the shape of a top-hat ['*Zylinderhut*', literally 'cylinder-hat'], which however was made of transparent glass. The situation made me think at once of the proverb: '*Mit dem Hute in der Hand kommt man durchs ganze Land*.'[2] The glass cylinder led me by a short detour to think of an incandescent gas-mantle; and I soon saw that I should like to make a discovery which would make me as rich and independent as my fellow countryman Dr Auer von Welsbach was made by his, and that I should like to travel instead of stopping in Vienna. In the dream I was travelling with my discovery, the hat in the shape of a glass cylinder – a discovery which, it is true, was not as yet of any great practical use. – The dream-work is particularly fond of representing two *contrary* ideas by the same composite structure. Thus, for instance, a woman had a dream in which she saw herself carrying a tall spray of flowers, such as the angel is represented as holding in pictures of the

1 [The '*trottoir roulant*' was a moving roadway installed at the Paris Exhibition of 1900.]

2 ['If you go hat in hand, you can cross the whole land.']

Annunciation. (This stood for innocence; incidentally, her own name was Maria.) On the other hand, the spray was covered with large white[1] flowers like camellias. (This stood for the opposite of innocence; it was associated with *La dame aux camélias*.)

A good proportion of what we have learnt about condensation in dreams may be summarized in this formula: each element in the content of a dream is 'overdetermined' by material in the dream thoughts; it is not derived from a *single* element in the dream thoughts, but may be traced back to a whole number. These elements need not necessarily be closely related to each other in the dream thoughts themselves; they may belong to the most widely separated regions of the fabric of those thoughts. A dream element is, in the strictest sense of the word, the 'representative' of all this disparate material in the content of the dream. But analysis reveals yet another side of the complicated relation between the
[653] content of the dream and the dream thoughts. Just as connections lead from each element of the dream to several dream thoughts, so as a rule a single dream thought is represented by more than one dream element; the threads of association do not simply converge from the dream thoughts to the dream content, they cross and interweave with each other many times over in the course of their journey.

Condensation, together with the transformation of thoughts into situations ('dramatization'), is the most important and peculiar characteristic of the dream-work. So far, however, nothing has transpired as to any *motive* necessitating this compression of the material.

V

[654] In the case of the complicated and confused dreams with which we are now concerned, condensation and dramatization alone are not enough to account for the whole of the impression that we gain of the dissimilarity between the content of the dream and the dream thoughts. We have evidence of the operation of a third factor, and this evidence deserves careful sifting.

First and foremost, when by means of analysis we have arrived at a knowledge of the dream thoughts, we observe that the manifest dream content deals with quite different material from the latent thoughts. This, to be sure, is no more than an appearance, which evaporates under closer examination, for we find ultimately that the whole of the dream

1 [This should probably be 'red'. The flowers are so described in the much fuller account of the dream given in *The Interpretation of Dreams* (*RSE*, **5**, 311).]

content is derived from the dream thoughts, and that almost all the dream thoughts are represented in the dream content. Nevertheless, something of the distinction still remains. What stands out boldly and clearly in the dream as its essential content must, after analysis, be satisfied with playing an extremely subordinate role among the dream thoughts; and what, on the evidence of our feelings, can claim to be the most prominent among the dream thoughts is either not present at all as ideational material in the content of the dream or is only remotely alluded to in some obscure region of it. We may put it in this way: *in the course of the dream-work the psychical intensity passes over from the thoughts and ideas to which it properly belongs on to others which in our judgement have no claim to any such emphasis*. No other process contributes so much to concealing the meaning of a dream and to making the connection between the dream content and the dream thoughts unrecognizable. In the course of this process, which I shall describe as 'dream displacement' [*Traumverschiebung*], the psychical intensity, significance or affective potentiality of the thoughts is, as we further find, transformed into sensory vividness. We assume as a matter of course that the most distinct element in the manifest content of a dream is the most important one; but in fact [owing to the displacement that has occurred] it is often an *indistinct* element which turns out to be the most direct derivative of the essential dream thought.

What I have called dream displacement might equally be described [in Nietzsche's phrase] as 'a transvaluation of psychical values'.[1] I shall not have given an exhaustive estimate of this phenomenon, however, unless I add that this work of displacement or transvaluation is performed to a very varying degree in different dreams. There are dreams which come about almost without any displacement. These are the ones which make sense and are intelligible, such, for instance, as those which we have recognized as undisguised wishful dreams. On the other hand, there are dreams in which not a single piece of the dream thoughts has retained its own psychical value, or in which everything that is essential in the dream thoughts has been replaced by something trivial. And we can find a complete series of transitional cases between these two extremes. The more obscure and confused a dream appears to be, the greater the share in its construction which may be attributed to the factor of displacement. [655]

Our specimen dream exhibits displacement to this extent at least, that its content seems to have a different *centre* from its dream thoughts. In the foreground of the dream content a prominent place is taken by a

1 [Cf. *RSE*, **4**, 294 and footnote.]

situation in which a woman seems to be making advances to me; while in the dream thoughts the chief emphasis is laid on a wish for once to enjoy unselfish love, love which 'costs nothing' – an idea concealed behind the phrase about 'beautiful eyes' and the far-fetched allusion to 'spinach'.

If we undo dream displacement by means of analysis, we obtain what seems to be completely trustworthy information on two much-disputed problems concerning dreams: as to their instigators and as to their connection with waking life. There are dreams which immediately reveal their derivation from events of the day; there are others in which no trace of any such derivation is to be discovered. If we seek the help of analysis, we find that every dream without any possible exception goes back to an impression of the past few days, or, it is probably more correct to say, of the day immediately preceding the dream, of the 'dream day'. The impression which plays the part of dream instigator may be such an important one that we feel no surprise at being concerned with it in the daytime, and in that case we rightly speak of the dream as carrying on with the significant interests of our waking life. As a rule, however, if a
[656] connection is to be found in the content of the dream with any impression of the previous day, that impression is so trivial, insignificant and unmemorable, that it is only with difficulty that we ourselves can recall it. And in such cases the content of the dream itself, even if it is connected and intelligible, seems to be concerned with the most indifferent trivialities, which would be unworthy of our interest if we were awake. A good deal of the contempt in which dreams are held is due to the preference thus shown in their content for what is indifferent and trivial.

Analysis does away with the misleading appearance upon which this derogatory judgement is founded. If the content of a dream puts forward some indifferent impression as being its instigator, analysis invariably brings to light a significant experience, and one by which the dreamer has good reason to be stirred. This experience has been replaced with the indifferent one, with which it is connected by copious associative links. Where the content of the dream treats of insignificant and uninteresting ideational material, analysis uncovers the numerous associative paths connecting these trivialities with things that are of the highest psychical importance in the dreamer's estimation. *If what make their way into the content of dreams are impressions and material which are indifferent and trivial rather than justifiably stirring and interesting, that is only the effect of the process of displacement*. If we answer our questions about dream instigators and the connection between dreaming and daily affairs on the basis of the new insight we have gained from replacing the manifest by

the latent content of dreams, we arrive at these conclusions: *dreams are never concerned with things which we should not think it worthwhile to be concerned with during the day, and trivialities which do not affect us during the day are unable to pursue us in our sleep*.

What was the dream instigator in the specimen that we have chosen for analysis? It was the definitely insignificant event of my friend giving me *a drive in a cab free of cost*. The situation in the dream at the table d'hôte contained an allusion to this insignificant precipitating cause, for in my conversation I had compared the taximeter cab with a table d'hôte. But I can also point to the important experience which was represented by this trivial one. A few days earlier I had paid out a considerable sum of money on behalf of a member of my family of whom I am fond. No wonder, said the dream thoughts, if this person were to feel grateful to me: love of that sort would not be 'free of cost'. Love that is free of cost, however, stood at the forefront of the dream thoughts. The fact that not [657]
long before I had had several *cab drives* with the relative in question made it possible for the cab drive with my friend to remind me of my connections with this other person.

The indifferent impression which becomes a dream instigator owing to associations of this kind is subject to a further condition which does not apply to the true source of the dream: it must always be a *recent* impression, derived from the dream day.

I cannot leave the subject of dream displacement without drawing attention to a remarkable process which occurs in the formation of dreams and in which condensation and displacement *combine* to produce the result. In considering condensation we have already seen the way in which two ideas in the dream thoughts which have something in common, some point of contact, are replaced in the dream content by a composite idea, in which a relatively distinct nucleus represents what they have in common, while indistinct subordinate details correspond to the respects in which they differ from each other. If displacement takes place in addition to condensation, what is constructed is not a composite idea but an 'intermediate common entity', which stands in a relation to the two different elements similar to that in which the resultant in a parallelogram of forces stands to its components. For instance, in the content of one of my dreams there was a question of an injection with *propyl*. To begin with, the analysis only led me to an indifferent experience which had acted as dream instigator, and in which a part was played by *amyl*. I was not yet able to justify the confusion between amyl and propyl. In the group of ideas behind this same dream, however, there was

also a recollection of my first visit to Munich, where I had been struck by the *Propylaea*.[1] The details of the analysis made it plausible to suppose that it was the influence of this second group of ideas upon the first one that was responsible for the displacement from amyl to propyl. *Propyl* is as it were an intermediate idea between *amyl* and *Propylaea*, and found its way into the content of the dream as a kind of *compromise*, by means of simultaneous condensation and displacement.[2]

[658] There is a still more urgent necessity in the case of the process of displacement than in that of condensation to discover the motive for these puzzling efforts on the part of the dream-work.

VI

[659] It is the process of displacement which is chiefly responsible for our being unable to discover or recognize the dream thoughts in the dream content, unless we understand the reason for their distortion. Nevertheless, the dream thoughts are also submitted to another and milder sort of transformation, which leads to our discovering a new achievement on the part of the dream-work – one, however, which is easily intelligible. The dream thoughts which we first come across as we proceed with our analysis often strike us by the unusual form in which they are expressed; they are not clothed in the prosaic language usually employed by our thoughts, but are on the contrary represented symbolically by means of similes and metaphors, in images resembling those of poetic speech. There is no difficulty in accounting for the constraint imposed upon the form in which the dream thoughts are expressed. The manifest content of dreams consists for the most part in pictorial situations; and the dream thoughts must accordingly be submitted in the first place to a treatment which will make them suitable for a representation of this kind. If we imagine ourselves faced with the problem of representing the arguments in a political leading article or the speeches of counsel before a court of law in a series of pictures, we shall easily understand the modifications which must necessarily be carried out by the dream-work owing to *considerations of representability in the content of the dream.*

The psychical material of the dream thoughts habitually includes recollections of impressive experiences – not infrequently dating back to early childhood – which are thus themselves perceived as a rule as situations having a visual subject matter. Wherever the possibility

1 [A ceremonial portico on the Athenian model.]

2 [The dream from which this detail is taken was the first one to be exhaustively analysed by Freud. It is reported at length in *The Interpretation of Dreams*. (Cf. *RSE*, **4**, 94 ff., and, for this particular detail, **4**, 261 f.)]

arises, this portion of the dream thoughts exercises a determining influence upon the form taken by the content of the dream; it constitutes, as it were, a nucleus of crystallization, attracting the material of the dream thoughts to itself and thus affecting their distribution. The situation in a dream is often nothing other than a modified repetition, complicated by interpolations, of an impressive experience of this kind; on the other hand, faithful and straightforward reproductions of [660] real scenes appear only rarely in dreams.

The content of dreams, however, does not consist entirely of situations, but also includes disconnected fragments of visual images, speeches and even bits of unmodified thoughts. It may therefore perhaps be of interest to enumerate very briefly the modes of representation available to the dream-work for reproducing the dream thoughts in the peculiar form of expression necessary in dreams.

The dream thoughts which we arrive at by means of analysis reveal themselves as a psychical complex of the most intricate possible structure. Its portions stand in the most manifold logical relations to one another: they represent foreground and background, conditions, digressions and illustrations, chains of evidence and counterarguments. Each train of thought is almost invariably accompanied by its contradictory counterpart. This material lacks none of the characteristics that are familiar to us from our waking thinking. If now all of this is to be turned into a dream, the psychical material will be submitted to a pressure which will condense it greatly, to an internal fragmentation and displacement which will, as it were, create new surfaces, and to a selective operation in favour of those portions of it which are the most appropriate for the construction of situations. If we take into account the genesis of the material, a process of this sort deserves to be described as a 'regression'. In the course of this transformation, however, the logical links which have hitherto held the psychical material together are lost. It is only, as it were, the substantive content of the dream thoughts that the dream-work takes over and manipulates. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the work of analysis.

The modes of expression open to a dream may therefore be qualified as meagre by comparison with those of our intellectual speech; nevertheless, a dream need not wholly abandon the possibility of reproducing the logical relations present in the dream thoughts. On the contrary, it succeeds often enough in replacing them by formal characteristics in its own texture.

In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream thoughts by
[661] combining the whole material into a single situation. They reproduce *logical connection* by *approximation in time and space*, just as a painter will represent all the poets in a single group in a picture of Parnassus.[1] It is true that they were never, in fact, assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.

A *causal relation* between two thoughts is either left unrepresented or is replaced by a *sequence* of two pieces of dream of different lengths. Here the representation is often reversed, the beginning of the dream standing for the consequence and its conclusion for the premise. An immediate *transformation* of one thing into another in a dream seems to represent the relation of *cause and effect*.

The alternative '*either–or*' is never expressed in dreams, both of the alternatives being inserted in the text of the dream as though they were equally valid. I have already mentioned that an 'either–or' used in *recording* a dream is to be translated by 'and'. [See p. 587 above.]

Ideas which are contraries are by preference expressed in dreams by one and the same element.[2] 'No' seems not to exist so far as dreams are concerned. Opposition between two thoughts, the relation of *reversal*, may be represented in dreams in a most remarkable way. It may be represented by some *other* piece of the dream content being turned into its opposite – as it were by an afterthought [*nachträglich*]. We shall hear presently of a further method of expressing contradiction. The sensation of *inhibition of movement* which is so common in dreams also serves to express a contradiction between two impulses, a *conflict of will*.

One and one only of these logical relations – that of *similarity, consonance, the possession of common attributes* –
[662] is very highly favoured by the mechanism of dream formation. The dream-work makes use of such cases as a foundation for dream condensation, by bringing together everything that shows an agreement of this kind into a new unity.

1 [See *RSE*, **4**, 280 *n.* 1.]

2 [*Footnote added* 1911:] It deserves to be remarked that well-known philologists have asserted that the most ancient human languages tended in general to express contradictory opposites by the same word. (E.g. 'strong–weak', 'inside–outside'. This has been described as 'the antithetical meaning of primal words'.) [Cf. Freud, 1910*e*; ibid., **11**, 145 ff.]

This short series of rough comments is of course inadequate to deal with the full extent of the formal means employed by dreams for the expression of logical relations in the dream thoughts. Different dreams are more or less carefully constructed in this respect; they keep more or less closely to the text presented to them; they make more or less use of the expedients that are open to the dream-work. In the second case they appear obscure, confused and disconnected. If, however, a dream strikes one as *obviously* absurd, if its content includes a piece of palpable nonsense, this is intentionally so; its apparent disregard of all the requirements of logic is expressing a piece of the intellectual content of the dream thoughts. Absurdity in a dream signifies the presence in the dream thoughts of *contradiction, ridicule and derision.* Since this statement is in the most marked opposition to the view that dreams are the product of a dissociated and uncritical mental activity, I will emphasize it by means of an example.

One of my acquaintances, Herr M., had been attacked in an essay with an unjustifiable degree of violence, as we all thought – by no less a person than Goethe. Herr M. was naturally crushed by the attack. He complained of it bitterly to some company at table; his veneration for Goethe had not been affected, however, by this personal experience. I now tried to throw a little light on the chronological data, which seemed to me improbable. Goethe died in 1832. Since his attack on Herr M. must naturally have been made earlier than that, Herr M. must have been quite a young man at the time. It seemed to be a plausible notion that he was eighteen. I was not quite sure, however, what year we were actually in, so that my whole calculation melted into obscurity. Incidentally, the attack was contained in Goethe's well-known essay on 'Nature'.

The nonsensical character of this dream will be even more glaringly obvious, if I explain that Herr M. is a youngish businessman, who is far removed from any poetical and literary interests. I have no doubt, however, that when I have entered into the analysis of the dream I shall succeed in showing how much 'method' there is in its nonsense.

The material of the dream was derived from three sources:

(1) Herr M., whom I had got to know among some *company at table*, [663] asked me one day to examine his elder brother, who was showing signs of disordered mental activity.[1] In the course of my conversation with the patient an awkward episode occurred, for he gave his brother away for no accountable reason by talking of his *youthful follies*. I had asked the patient the *year of his birth* (cf. the *year* of Goethe's *death* in the dream)

1 [In this context, *gestörter geistiger Tätigkeit* implies general paralysis of the insane, i.e. syphilis.]

and had made him carry out a number of calculations in order to test the weakness of his memory.

(2) A medical journal, which bore my name among others on its title page, had published a positively '*crushing*' criticism by a *youthful* reviewer of a book by my friend F. in Berlin. I took the editor to task over this; but, though he expressed his regret, he would not undertake to offer any redress. I therefore severed my connection with the journal, but in my letter of resignation expressed a hope that *our personal relations would not be affected by the event*. This was the true source of the dream. The unfavourable reception of my friend's work had made a profound impression on me. It contained, in my opinion, a fundamental biological discovery, which is only now – many years later – beginning to find favour with the experts.

(3) A woman patient of mine had given me an account a short time before of her brother's illness, and how he had broken out in a frenzy with cries of '*Nature! Nature!*' The doctors believed that his exclamation came from his having read *Goethe's* striking essay on that subject and that it showed he had been overworking at his studies. I had remarked that *it seemed to me more plausible* that his exclamation of the word 'Nature' should be taken in the sexual sense in which it is used by the less educated people here. This idea of mine was at least not disproved by the fact that the unfortunate young man subsequently mutilated his own genitals. He was *eighteen* at the time of his outbreak.

Behind my own ego [*Ich*][T] in the dream content there lay concealed, in the first instance, my friend who had been so badly treated by the critic. '*I tried to throw a little light on the chronological data*.' My friend's book dealt with the *chronological data* of life and among other things showed that the length of *Goethe's* life was a multiple of a number of days that has a significance in biology. But this ego was compared with a paralytic: '*I was not quite sure what year we were in*.' Thus the dream made out that my friend was behaving like a paralytic, and in this respect it was a mass
[664] of absurdities. The dream thoughts, however, were saying ironically: 'Naturally, it's *he* [my friend F.] who is the crazy fool and it's *you* [the critics] who are the men of genius and know better. Surely it couldn't be the *reverse*?' There were plenty of examples of this *reversal* in the dream. For instance, Goethe attacked the young man, which is absurd, whereas it is still easy for quite a young man to attack the great Goethe.

I should like to lay it down that no dream is prompted by motives other than egoistic ones.[1] In fact, the ego in the present dream does not

1 [Freud has, however, qualified this statement in an additional footnote written in 1925, which can be found near the end of Chapter V of *The Interpretation of Dreams* (*RSE*, **4**, 240 *n.* 2).]

stand only for my friend but for myself as well. I was identifying myself with him, because the fate of his discovery seemed to foreshadow the reception of my own findings. If I were to bring forward my theory emphasizing the part played by sexuality in the aetiology of psychoneurotic disorders (cf. the allusion to the eighteen-year-old patient's cry of 'Nature! Nature!'), I should come across the same criticisms; and I was already preparing to meet them with the same derision.

If we pursue the dream thoughts further, we shall keep on finding ridicule and derision as correlates of the absurdities of the manifest dream. It is well known that it was the discovery of the split skull of a sheep on the Lido of Venice that gave Goethe the idea of the so-called 'vertebral' theory of the skull. My friend boasts that, when he was a student, he released a storm which led to the resignation of an old professor who, though he had once been distinguished (among other things in connection precisely with the same branch of comparative anatomy), had become incapable of teaching owing to *senile dementia*. Thus the agitation which my friend promoted served to combat the mischievous system according to which there is no *age limit* for academic workers in German universities – for *age is proverbially no defence against folly*. – In the hospital here I had the honour of serving for years under a chief who had long been a *fossil* and had for decades been notoriously *feeble-minded*, but who was allowed to continue carrying on his responsible duties.[1] At this point I thought of a descriptive term based upon the discovery on the Lido.[2] Some of my young contemporaries at the hospital concocted, in connection with this man, [665]
a version of what was then a popular song: '*Das hat kein Goethe g'schrieben, das hat kein Schiller g'dicht . . .*'[3]

VII

We have not yet come to the end of our consideration of the dream- [666]
work. In addition to condensation, displacement and pictorial arrangement of the psychical material, we are obliged to assign it yet another activity, though this is not to be found in operation in *every* dream. I shall not deal exhaustively with this part of the dream-work, and will therefore merely remark that the easiest way of forming an

1 [According to Ernest Jones (1953, 218), this was Dr Franz Scholz.]

2 ['*Schafkopf*', literally 'sheep's head' = 'silly ass'.]

3 ['This was written by no Goethe, this was composed by no Schiller.' – This dream is also discussed at length in *The Interpretation of Dreams* (*RSE*, **5**, 392, etc.). See also the addition to footnote 1, p. 394. – The story of Goethe's discovery on the Lido appears again, as an association to a different dream, in Letter 70 to Fliess (Freud, 1950*a*). Cf. *RSE*, **1**, 289.]

idea of its nature is to suppose – though the supposition probably does not meet the facts – that *it comes into operation only* AFTER [*erst nachträglich*][T] *the dream content has already been constructed*. Its function would then consist in arranging the constituents of the dream in such a way that they form an approximately connected whole, a dream composition. In this way the dream is given a kind of façade (though this does not, it is true, hide its content at every point), and thus receives a first, preliminary interpretation, which is supported by interpolations and slight modifications. Incidentally, this revision of the dream content is only possible if it is not too punctiliously carried out; nor does it present us with anything more than a glaring misunderstanding of the dream thoughts. Before we start upon the analysis of a dream we have to clear the ground of this attempt at an interpretation.

The motive for this part of the dream-work is particularly obvious. *Considerations of intelligibility* are what lead to this final revision of a dream; and this reveals the origin of the activity. It behaves towards the dream content lying before it just as our normal psychical activity behaves in general towards any perceptual content that may be presented to it. It understands that content on the basis of certain anticipatory ideas, and arranges it, even at the moment of perceiving it, on the presupposition of its being intelligible; in so doing it runs a risk of falsifying it, and in fact, if it cannot bring it into line with anything familiar, is prey to the strangest misunderstandings. As is well known, we are incapable of seeing a series of unfamiliar signs or of hearing a succession of unknown words, without at once falsifying the perception from considerations of intelligibility, on the basis of something already known to us.

[667] Dreams which have undergone a revision of this kind at the hands of a psychical activity completely analogous to waking thought may be described as 'well constructed'. In the case of other dreams this activity has completely broken down; no attempt even has been made to arrange or interpret the material, and, since after we have woken up we feel ourselves identical to this last part of the dream-work, we make a judgement that the dream was 'hopelessly confused'. From the point of view of analysis, however, a dream that resembles a disordered heap of disconnected fragments is just as valuable as one that has been beautifully polished and provided with a surface. In the former case, indeed, we are saved the trouble of demolishing what has been superimposed upon the dream content.

It would be a mistake, however, to suppose[I] that these dream façades are nothing other than mistaken and somewhat arbitrary revisions of the dream content by the conscious agency of our mental life. In the erection of a dream façade use is not infrequently made of wishful phantasies [*Wunschphantasien*][T] which are present in the dream thoughts in a pre-constructed form, and are of the same character as the appropriately named 'daydreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the façade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material. *Phantasie*

The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream thoughts into the dream content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that *these intellectual operations have already been performed in the dream thoughts and have only been* TAKEN OVER *by the dream content*. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in [668] the dream thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream content signifies nothing more than that there is a calculation in the dream thoughts; but while the latter is always rational, a dream calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

It will perhaps be as well to support these last assertions by a few examples.

1 [This paragraph was added in 1911.]

(i) Here is an innocent-sounding, well-constructed dream dreamt by a woman patient:

She dreamt she was going to the market with her cook, who was carrying the basket. After she had asked for something, the butcher said to her: 'That's not obtainable any longer,' and offered her something else, adding: 'This is good too.' She rejected it and went on to the woman who sells vegetables, who tried to get her to buy a peculiar vegetable that was tied up in bundles but was of a black colour. She said: 'I don't recognize that; I won't take it.'

The remark '*That's not obtainable any longer*' originated from the treatment itself. A few days earlier I had explained to the patient in those very words that the earliest memories of childhood were '*not obtainable any longer* as such', but were replaced in analysis by 'transferences' [*Übertragungen*]^{T}, and dreams. So *I* was the butcher.

The second speech – '*I don't recognize that*' – occurred in an entirely different connection. On the previous day she had reproved her cook, who incidentally also appeared in the dream, with the words: '*Behave yourself properly! I don't recognize that!*' meaning, no doubt, that she did not understand such behaviour and would not put up with it. As the result of a displacement, it was the more innocent part of this speech which made its way into the content of the dream; but in the dream thoughts it was only the other part of the speech that played a part. For
[669] the dream-work had reduced to complete unintelligibility and extreme innocence an imaginary situation in which *I* was *behaving improperly* to the lady in a particular way. But this situation which the patient was expecting in her imagination was itself only a new edition of something she had once actually experienced.[1]

(ii) Here is an apparently quite meaningless dream containing figures.

She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you doing? It only costs 21 kreuzers.'

The dreamer came from abroad and her daughter was at school here. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The day before the dream the headmistress had suggested to her that she should leave her daughter at school for another year. In that case she could also have continued her treatment for a year. The figures in the dream become significant if we remember that 'time is money'. One year is equal to 365 days, or, expressed in money, 365 kreuzers or 3 florins 65 kreuzers. The 21 kreuzers

1 [This dream is reported in greater detail in *The Interpretation of Dreams* (*RSE*, **4**, 162 f.).]

corresponded to the 3 weeks which had still to run between the dream day and the end of the school term and also to the end of the patient's treatment. It was clearly financial considerations which had induced the lady to refuse the headmistress's proposal, and which were responsible for the smallness of the sums mentioned in the dream.[1]

(III) A lady who, though she was still young, had been married for a number of years, received news that an acquaintance of hers, Fräulein Elise L., who was almost exactly her contemporary, had become engaged. This was the precipitating cause of the following dream:

She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too, but had only been able to get bad seats – three for 1 florin 50 kreuzers – and of course they could not take those. She thought it would not really have done any harm if they had.

What interests us here is the source of the figures in the material of the dream thoughts and the transformations which they underwent. What [670]
was the origin of the 1 florin 50 kreuzers? It came from what was in fact an indifferent event of the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had *been in a hurry* to get rid of them by buying a piece of jewellery. It is to be noticed that 150 florins is a *hundred* times as much as 1 florin 50 kreuzers. The only connection with the 'three', which was the number of the theatre tickets, was that her newly engaged friend was that number of months – three – her junior. The situation in the dream was a repetition of a small incident which her husband often teased her about. On one occasion she had been in a great hurry to buy tickets for a play in advance, and when she got to the theatre she had found that one side of the stalls was almost completely empty. There had been *no need for her to be in such a hurry*. Finally, we must not overlook the *absurdity* in the dream of two people taking three tickets for a play.

Now for the dream thoughts: 'It was *absurd* to marry so early. There was *no need for me to be in such a hurry*. I see from Elise L.'s example that I should have got a husband in the end. Indeed, I should have got one *a hundred times* better' (a treasure) 'if I had only waited. My money' (or dowry) 'could have bought *three* men just as good.'[2]

1 [For this dream, see *The Interpretation of Dreams* (*RSE*, **5**, 370).]

2 [This dream, which is mentioned again below, on p. 606, is discussed in *The Interpretation of Dreams* (*RSE*, **5**, 371 f.) and at greater length in Freud's *Introductory Lectures* (1916–17*a*), especially in Lectures VII and XIV; ibid., **15**, 107–9 and 192–3.]

VIII

[671] Having been made acquainted with the dream-work by the foregoing discussion, we shall no doubt be inclined to pronounce it a quite peculiar psychical process, the like of which, so far as we are aware, does not exist elsewhere. It is as though we were carrying over on to the dream-work all the astonishment which used formerly to be aroused in us by its product, the dream. In fact, however, the dream-work is only the first to be discovered of a whole series of psychical processes, responsible for the generation of hysterical symptoms, of phobias, obsessions and delusions. Condensation and, above all, displacement are invariable characteristics of these other processes as well. Modification into a pictorial form, on the other hand, remains a peculiarity of the dream-work. If this explanation places dreams in a single series alongside the structures produced by psychical illness, this makes it all the more important for us to discover the essential determining conditions of such processes as those of dream formation. We shall probably be surprised to hear that neither the state of sleep nor illness is among these indispensable conditions. A whole number of the phenomena of the everyday life of healthy people – such as forgetting, slips of the tongue, bungled actions and a particular class of errors – owe their origin to a psychical mechanism analogous to that of dreams and of the other members of the series.[1]

The heart of the problem lies in displacement, which is by far the most striking of the special achievements of the dream-work. If we enter deeply into the subject, we come to realize that the essential determining condition of displacement is a purely psychological one: something in the nature of a *motive* [*Motivierung*]. One comes upon its track if one takes into consideration certain experiences which one cannot escape in analysing dreams. In analysing my specimen dream I was obliged to break off my report of the dream thoughts on page 579 f., because, as I confessed, there were some among them which I should prefer to conceal from strangers and which I could not communicate to other people without doing serious mischief in important directions. I added that
[672] nothing would be gained if I were to choose another dream instead of that particular one with a view to reporting its analysis: I should come upon dream thoughts which needed to be kept secret in the case of *every* dream with an obscure or confused content. If, however, I were to continue the analysis on my own account, without any reference to other

1 [See Freud's *Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 1–37, 46–91, 140–64 and 187–97.]

people (whom, indeed, an experience so personal as my dream cannot possibly have been intended to reach), I should eventually arrive at thoughts which would surprise me, whose presence in me I was unaware of, which were not only *alien* but also *disagreeable* to me, and which I should therefore feel inclined to dispute energetically, although the chain of thoughts running through the analysis insisted upon them remorselessly. There is only one way of accounting for this state of affairs, which is of quite universal occurrence; and that is to suppose that these thoughts really were present in my mind, and in possession of a certain amount of psychical intensity or energy, but that they were in a peculiar psychological situation, as a consequence of which they *could not become conscious* to me. (I describe this particular condition as one of 'repression' [*Verdrängung*][T].) We cannot help concluding, then, that there is a causal connection between the obscurity of the dream content and the state of repression (inadmissibility to consciousness) of certain of the dream thoughts, and that the dream had to be obscure so as not to betray the proscribed dream thoughts. Thus we are led to the concept of a 'dream distortion', which is the product of the dream-work and serves the purpose of dissimulation, that is, of disguise.

I will test this on the specimen dream which I chose for analysis, and enquire what the thought was which made its way into that dream in a distorted form, and which I should be inclined to repudiate if it were undistorted. I recall that my free cab drive reminded me of my recent expensive drive with a member of my family, that the interpretation of the dream was 'I wish I might for once experience love that cost me nothing', and that a short time before the dream I had been obliged to spend a considerable sum of money on this same person's account. Bearing this context in mind, I cannot escape the conclusion that *I regret having made that expenditure*. Not until I have recognized this impulse does my wish in the dream for the love which would call for *no* expenditure acquire a meaning. Yet I can honestly say that when I decided to spend this sum of money I did not hesitate for a moment. My regret at having to do so – the [673]
contrary current of feeling – did not become conscious to me. *Why* it did not is another and a far-reaching question, the answer to which is known to me but belongs in another connection.

If the dream that I analyse is not my own, but someone else's, the conclusion will be the same, though the grounds for believing it will be different. If the dreamer is a healthy person, there is no other means open to me of obliging him to recognize the repressed ideas that have been discovered than by pointing out the context of the dream thoughts;

and I cannot help it if he refuses to recognize them. If, however, I am dealing with a neurotic patient, with a hysteric for instance, he will find the acceptance of the repressed thought forced upon him, owing to its connection with the symptoms of his illness, and owing to the improvement he experiences when he exchanges those symptoms for the repressed ideas. In the case, for instance, of the woman patient who had the dream I have just quoted about the three theatre tickets which cost 1 florin 50 kreuzers, the analysis led to the inevitable conclusion that she had a low estimate of her husband (cf. her idea that she could have got one 'a hundred times better'), that she regretted having married him, and that she would have liked to exchange him for another one. It is true that she asserted that she loved her husband, and that her emotional life knew nothing of any such low estimate of him, but all her symptoms led to the same conclusion as the dream. And after her repressed memories had been revived of a particular period during which she had consciously not loved her husband, her symptoms cleared up and her resistance against the interpretation of the dream disappeared.

IX

[674] Now that we have established the concept of repression and have brought dream distortion into relation with repressed psychical material, we can express in general terms the principal finding to which we have been led by the analysis of dreams. In the case of dreams which are intelligible and have a meaning, we have found that they are undisguised wish fulfilments; that is, that in their case the dream situation represents as fulfilled a wish which is known to consciousness, which is left over from daytime life, and which is deservedly of interest. Analysis has taught us something entirely analogous in the case of obscure and confused dreams: once again the dream situation represents a wish as fulfilled – a wish which invariably arises from the dream thoughts, but one which is represented in an unrecognizable form and can only be explained when it has been traced back in analysis. The wish in such cases is either itself a repressed one and alien to consciousness, or it is intimately connected with repressed thoughts and is based upon them. Thus the formula for such dreams is as follows: *they are disguised fulfilments of repressed wishes*. It is interesting in this connection to observe that the popular belief that dreams always foretell the future is confirmed. Actually the future which the dream shows us is not the one which *will* occur but the one which we should *like* to occur. The

popular mind is behaving here as it usually does: what it wishes, it believes.

Dreams fall into three classes according to their attitude to wish fulfilment. The first class consists of those which represent an unrepressed wish undisguisedly; these are the dreams of an infantile type which become ever rarer in adults. Secondly there are the dreams which express a repressed wish disguisedly; these no doubt form the overwhelming majority of all our dreams, and require analysis before they can be understood. In the third place there are the dreams which represent a repressed wish, but do so with insufficient or no disguise. These last dreams are invariably accompanied by anxiety [*Angst*][T], which interrupts them. In their case anxiety takes the place of dream distortion; and in dreams of the second class anxiety is only avoided owing to the dream-work. There is no great difficulty in proving that the ideational [675]
content which produces anxiety in us in dreams was once a wish but has since undergone repression.

There are also clear dreams with a distressing content, which, however, is not felt as distressing in the dream itself. For this reason they cannot be counted as anxiety dreams; but they have always been taken as evidence of the fact that dreams are without meaning and have no psychical value. An analysis of a dream of this kind will show that we are dealing with well-disguised fulfilments of repressed wishes, that is to say with a dream of the second class; it will also show how admirably the process of displacement is adapted for disguising wishes.

A girl had a dream of seeing her sister's only surviving child lying dead in the same surroundings in which a few years earlier she had in fact seen the dead body of her sister's *first* child. She felt no pain over this; but she naturally rejected the idea that this situation represented any wish of hers. Nor was there any need to suppose this. It had been beside the first child's coffin, however, that, years before, she had seen and spoken to the man she was in love with; if the second child died, she would no doubt meet the man again in her sister's house. She longed for such a meeting, but fought against the feeling. On the dream day she had bought a ticket for a lecture which was to be given by this same man, to whom she was still devoted. Her dream was a simple dream of impatience of the kind that often occurs before journeys, visits to the theatre, and similar enjoyments that lie ahead. But in order to disguise this longing from her, the situation was displaced on to an event of a kind most unsuitable for producing a feeling of enjoyment, though it had in fact done so in the past. It is to be observed that the

emotional behaviour in the dream was appropriate to the real content which lay in the background and not to what was pushed into the foreground. The dream situation anticipated the meeting she had so long desired; it offered no basis for any painful feelings.[1]

X

[676] Hitherto philosophers have had no occasion to concern themselves with a psychology of repression. We may therefore be permitted to make a first approach to this hitherto unknown topic by constructing a pictorial image of the course of events in dream formation. It is true that the schematic picture we have arrived at – not only from the study of dreams – is a fairly complicated one; but we cannot manage with anything simpler. Our hypothesis is that in our mental apparatus [*seelischen Apparat*][T] there are two thought-constructing agencies, the second of which enjoys the privilege of having free access to consciousness for its products, whereas the activity of the first is in itself unconscious and can only reach consciousness by way of the second. On the frontier between the two agencies, where the first passes over to the second, there is a censorship, which only allows what is agreeable to it to pass through and holds back everything else. According to our definition, then, what is rejected by the censorship is in a state of repression. Under certain conditions, of which the state of sleep is one, the relation between the strength of the two agencies is modified in such a way that what is repressed can no longer be held back. In the state of sleep this probably occurs owing to a relaxation of the censorship; when this happens it becomes possible for what has hitherto been repressed to make a path for itself to consciousness. Since, however, the censorship is never completely eliminated but merely reduced, the repressed material must submit to certain alterations which mitigate its offensive features. What becomes conscious in such cases is a compromise between the intentions of one agency and the demands of the other. *Repression – relaxation of the censorship – the formation of a compromise*, this is the fundamental pattern for the generation not only of dreams but of many other psychopathological structures; and in the latter cases too we may observe that the formation of compromises is accompanied by processes of condensation and displacement and by the employment of superficial associations, which we have become familiar with in the dream-work.

1 [This dream is reported in greater detail in *The Interpretation of Dreams* (*RSE*, **4**, 135 f.).]

We have no reason to disguise the fact that in the hypothesis which we have set up in order to explain the dream-work a part is played by what might be described as a 'demonic' element. We have gathered an impression that the formation of obscure dreams occurs *as though* one person who was dependent upon a second person had to make a remark which was bound to be disagreeable in the ears of this second one; and it is on the basis of this simile that we have arrived at the concepts of dream distortion and censorship, and have endeavoured to translate our impression into a psychological theory which is no doubt crude but is at least lucid. Whatever it may be with which a further investigation of the subject may enable us to identify our first and second agencies, we may safely expect to find a confirmation of some correlate of our hypothesis that the second agency controls access to consciousness and can bar the first agency from such access. [677]

When the state of sleep is over, the censorship quickly recovers its full strength; and it can now wipe out all that was won from it during the period of its weakness. This must be one part at least of the explanation of the forgetting of dreams, as is shown by an observation which has been confirmed on countless occasions. It not infrequently happens that during the narration of a dream or during its analysis a fragment of the dream content which had seemed to be forgotten re-emerges. This fragment which has been rescued from oblivion invariably affords us the best and most direct access to the meaning of the dream. And that, in all probability, must have been the only reason for its having been forgotten, that is, for its having been once more suppressed.

XI

When once we have recognized that the content of a dream is the representation of a fulfilled wish and that its obscurity is due to alterations in repressed material made by the censorship, we shall no longer have any difficulty in discovering the *function* of dreams. It is commonly said that sleep is disturbed by dreams; strangely enough, we are led to a contrary view and must regard dreams as *the guardians of sleep*. [678]

In the case of children's dreams there should be no difficulty in accepting this statement. The state of sleep or the psychical modification involved in sleep, whatever that may be, is brought about by a resolve to sleep which is either imposed upon the child or is reached on the basis of sensations of fatigue; and it is only made possible by the withholding of stimuli which might suggest to the psychical apparatus aims other than

that of sleeping. The means by which *external* stimuli can be kept off are familiar to us; but what are the means available for controlling *internal* mental stimuli which set themselves against falling asleep? Let us observe a mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but uses her authority to postpone others of them to the next day. It is clear that any wishes or needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing story told by Balduin Groller [a popular nineteenth-century Austrian novelist] of the bad little boy who woke up in the middle of the night and shouted across the night nursery: 'I want the rhino!' A better-behaved child, instead of shouting, would have *dreamt* that he was playing with the rhino. Since a dream that shows a wish as fulfilled is *believed* during sleep, it does away with the wish and makes sleep possible. It cannot be disputed that dream images are believed in in this way, for they are clothed in the psychical appearance of perceptions, and children have not yet acquired the later faculty of distinguishing hallucinations or phantasies from reality.

Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to post-
[679] pone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults – and this no doubt applies without exception to everyone in full possession of his senses – a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought material derived from those impulses is in a state of repression.

Now while this agency, in which we recognize our normal ego, is concentrated on the wish to sleep, it appears to be compelled by the psychophysiological conditions of sleep to relax the energy with which

it is accustomed to hold down the repressed material during the day. In itself, no doubt, this relaxation does no harm; however much the suppressed impulses of the childish mind may prance around, their access to consciousness is still difficult and their access to movement is barred, as the result of this same state of sleep. The danger of sleep being disturbed by them must, however, be guarded against. We must in any case suppose that even during deep sleep a certain amount of free attention is on duty as a guard against sensory stimuli, and that this guard may sometimes consider waking more advisable than a continuation of sleep. Otherwise there would be no explanation of how it is that we can be woken up at any moment by sensory stimuli of some particular *quality*. As the physiologist Burdach [1838, 486] insisted long ago, a mother, for instance, will be roused by the whimpering of her baby, or a miller if his mill comes to a stop, or most people if they are called softly by their own name. Now the attention which is thus on guard is also directed towards internal wishful stimuli arising from the repressed material, and combines with them to form the dream which, as a compromise, simultaneously satisfies [680] both of the two agencies. The dream provides a kind of psychical consummation for the wish that has been suppressed (or formed with the help of repressed material) by representing it as fulfilled; but it also satisfies the other agency by allowing sleep to continue. In this respect our ego is ready to behave like a child; it gives credence to the dream images, as though what it wanted to say was: 'Yes, yes! you're quite right, but let me go on sleeping!' The low estimate which we form of dreams when we are awake, and which we relate to their confused and apparently illogical character, is probably nothing other than the judgement passed by our sleeping ego upon the repressed impulses, a judgement based, with better right, upon the motor impotence of these disturbers of sleep. We are sometimes aware in our sleep of this contemptuous judgement. If the content of a dream goes too far in overstepping the censorship, we think: 'After all, it's only a dream!' – and go on sleeping.

This view is not traversed by the fact that there are marginal cases in which the dream – as happens with anxiety dreams – can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone.

The function of the dream as a guardian of sleep becomes particularly evident when an external stimulus impinges upon the senses of a sleeper. It is generally recognized that sensory stimuli arising during sleep influence the content of dreams; this can be proved experimentally and is among the few certain (but, incidentally, greatly overvalued) findings of medical investigation into dreams. But this finding involves a puzzle which has hitherto proved insoluble. For the sensory stimulus which the experimenter causes to impinge upon the sleeper is not correctly recognized in the dream; it is subjected to one of an indefinite number of possible interpretations, the choice being apparently left to an arbitrary psychical determination. But there is, of course, no such thing as arbitrary determination in the mind. There are several ways in which a
[681] sleeper may react to an external sensory stimulus. He may wake up or he may succeed in continuing his sleep in spite of it. In the latter case he may make use of a dream in order to get rid of the external stimulus, and here again there is more than one method open to him. For instance, he may get rid of the stimulus by dreaming that he is in a situation which is absolutely incompatible with the stimulus. Such was the line taken by a sleeper who was subject to disturbance by a painful abscess on the perineum. He dreamt that he was riding on a horse, making use of the poultice that was intended to mitigate his pain as a saddle, and in this way he avoided being disturbed.[1] Or, as happens more frequently, the external stimulus is given an interpretation which brings it into the context of a repressed wish which is at the moment awaiting fulfilment; in this way the external stimulus is robbed of its reality and is treated as though it were a portion of the psychical material. Thus someone dreamt that he had written a comedy with a particular plot; it was produced in a theatre, the first act was over, and there were thunders of applause; the clapping was terrific. . . . The dreamer must have succeeded in prolonging his sleep till after the interference had ceased; for when he woke up he no longer heard the noise, but rightly concluded that someone must have been beating a carpet or mattress. Every dream which occurs immediately before the sleeper is woken by a loud noise has made an attempt at explaining away the arousing stimulus by providing another explanation of it and has thus sought to prolong sleep, even if only for a moment.

1 [This dream is reported in full in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 203 f.]

XII[1]

No-one who accepts the view that the censorship is the chief reason for [682]
dream distortion will be surprised to learn from the results of dream interpretation that most of the dreams of adults are traced back by analysis to *erotic wishes*. This assertion is not aimed at dreams with an *undisguised* sexual content, which are no doubt familiar to all dreamers from their own experience and are as a rule the only ones to be described as 'sexual dreams'. Even dreams of this latter kind offer enough surprises in their choice of the people whom they make into sexual objects, in their disregard of all the limitations which the dreamer imposes in his waking life upon his sexual desires, and by their many strange details, hinting at what are commonly known as 'perversions'. A great many other dreams, however, which show no sign of being erotic in their manifest content, are revealed by the work of interpretation in analysis as sexual wish fulfilments; and, on the other hand, analysis proves that a great many of the thoughts left over from the activity of waking life as 'residues of the previous day' only find their way to representation in dreams through the assistance of repressed erotic wishes.

There is no theoretical necessity why this should be so; but to explain the fact it may be pointed out that no other group of drives [*Trieben*][T] has been submitted to such far-reaching suppression by the demands of cultural education, while at the same time the sexual drives are also the ones which, in most people, find it easiest to escape from the control of the highest mental agencies. Since we have become acquainted with infantile sexuality, which is often so unobtrusive in its manifestations and is always overlooked and misunderstood, we are justified in saying that almost every civilized man retains the infantile forms of sexual life in some respect or other. We can thus understand how it is that repressed infantile sexual wishes provide the most frequent and strongest driving forces for the construction of dreams.[2]

There is only one method by which a dream which expresses erotic wishes can succeed in appearing innocently nonsexual in its manifest [683]
content. The material of the sexual ideas must not be represented as such, but must be replaced in the content of the dream by hints, allusions and similar forms of indirect representation. But, unlike other forms of indirect representation, that which is employed in dreams must not be immediately intelligible. The modes of representation which fulfil these

1 [The whole of this section was added in 1911.]

2 See my *Three Essays on the Theory of Sexuality* (1905*d*). [*RSE*, 7, 161 ff.]

conditions are usually described as 'symbols' of the things which they represent. Particular interest has been directed to them since it has been noticed that dreamers speaking the same language make use of the same symbols, and that in some cases, indeed, the use of the same symbols extends beyond the use of the same language. Since dreamers themselves are unaware of the meaning of the symbols they use, it is difficult at first sight to discover the source of the connection between the symbols and what they replace and represent. The fact itself, however, is beyond doubt, and it is important for the technique of dream interpretation. For, with the help of a knowledge of dream symbolism, it is possible to understand the meaning of separate elements of the content of a dream or separate pieces of a dream or in some cases even whole dreams, without having to ask the dreamer for his associations.[1] Here we are approaching the popular ideal of translating dreams and, on the other hand, are returning to the technique of interpretation used by the ancients, to whom dream interpretation was identical to interpretation by means of symbols.

Although the study of dream symbols is far from being complete, we are in a position to lay down with certainty a number of general statements and a quantity of special information on the subject. There are some symbols which bear a single meaning almost universally: thus the emperor and empress (or the king and queen) stand for the parents, rooms represent women[2] and their entrances and exits the openings of the body. The majority of dream symbols serve to represent persons, parts of the body and activities invested with erotic interest; in particular, the genitals are represented by a number of often very surprising symbols, and the greatest variety of objects are employed to denote them symbolically. Sharp weapons, long and stiff objects, such as tree-trunks
[684] and sticks, stand for the male genital; while cupboards, boxes, carriages or ovens may represent the uterus [*Frauenlieb*]. In such cases as these the *tertium comparationis*, the common element in these substitutions, is immediately intelligible; but there are other symbols in which it is not so easy to grasp the connection. Symbols such as a staircase or going upstairs to represent sexual intercourse, a tie or cravat for the male organ, or wood for the female one, provoke our unbelief until we can arrive at an understanding of the symbolic relation underlying them by some other

1 [See, however, the qualification three paragraphs below.]

2 Cf. '*Frauenzimmer*' [literally 'women's apartment', commonly used in German as a slightly derogatory word for 'woman'].

means. Moreover, a whole number of dream symbols are bisexual and can relate to the male or female genitals according to the context.

Some symbols are universally disseminated and can be met with in all dreamers belonging to a single linguistic or cultural group; there are others which occur only within the most restricted and individual limits, symbols constructed by an individual out of his own ideational material. Of the former class we can distinguish some whose claim to represent sexual ideas is immediately justified by linguistic usage (such, for instance, as those derived from agriculture, e.g. 'fertilization' or 'seed') and others whose relation to sexual ideas appears to reach back into the very earliest ages and to the most obscure depths of our conceptual functioning. The power of constructing symbols has not been exhausted in our own days in the case of either of the two sorts of symbols which I have distinguished at the beginning of this paragraph. Newly discovered objects (such as airships) are, as we may observe, at once adopted as universally available sexual symbols.

It would, incidentally, be a mistake to expect that if we had a still profounder knowledge of dream symbolism (of the 'language of dreams') we could do without asking the dreamer for his associations to the dream and go back entirely to the technique of dream interpretation of antiquity. Quite apart from individual symbols and oscillations in the use of universal ones, one can never tell whether any particular element in the content of a dream is to be interpreted symbolically or in its proper sense, and one can be certain that the *whole* content of a dream is not to be interpreted symbolically. A knowledge of dream symbolism will never do more than enable us to translate certain constituents of the dream content, and will not relieve us of the necessity for applying the technical rules which I gave earlier. It will, however, afford the most valuable assistance to interpretation precisely at points [685] at which the dreamer's associations are insufficient or fail altogether.

Dream symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals.

If the account I have given in this short discussion of the symbolic mode of expression in dreams appears incomplete, I can justify my neglect by drawing attention to one of the most important pieces of knowledge that we possess on this subject. Dream symbolism extends far beyond dreams: it is not peculiar to dreams, but exercises a similar dominating influence on representation in fairy tales, myths and legends, in jokes and in folklore. It enables us to trace the intimate connections

between dreams and these latter productions. We must not suppose that dream symbolism is a creation of the dream-work; it is in all probability a characteristic of the unconscious thinking which provides the dream-work with the material for condensation, displacement and dramatization.[1]

XIII

[686] I lay no claim to having thrown light in these pages upon *all* the problems of dreams, nor to having dealt in a convincing way with those that I *have* discussed. Anyone who is interested in the whole extent of the literature of dreams may be referred to a work by Sante de Sanctis (*I sogni*, 1899); and anyone who wishes to hear more detailed arguments in favour of the view of dreams which I myself have put forward should turn to my volume *The Interpretation of Dreams*, 1900.[2] It only remains for me now to indicate the direction in which my exposition of the subject of the dream-work calls for pursuit.

I have laid it down as the task of dream interpretation to replace the dream by the latent dream thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream thoughts – a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

1 Further information on dream symbolism may be found in the works of early writers on dream interpretation, e.g. Artemidorus of Daldis and Scherner (1861), and also in my own *Interpretation of Dreams* (1900*a*) [Chapter VI, Section E], in the mythological studies of the psychoanalytic school, as well as in some of W. Stekel's writings (e.g. 1911*a*). [See further Lecture X (on 'Symbolism in Dreams') in Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 130 ff.]

2 [Cf. also the eleven lectures on dreams which constitute Part II of Freud's *Introductory Lectures* (1916–17*a*), ibid., **15**, 73–209.]

BIBLIOGRAPHIES

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*. Entries marked with an asterisk have not been verified for the present edition. See Editors' Introduction, p. xxiv above.

Famous speakers (Dr Lecher), 238
Father on his deathbed like Garibaldi, 381–3, 399–400, 427
Frau Doni and the three children, 399, 427
Funeral oration by young doctor, 158, 159 *n.* 3
Glass top-hat, 589
Goethe's attack on Herr M., 291, 300 *n.*, 392–4, 400–1, 597–8
Hall with machines, 299–300, 305
'Hearsing', 265–6
'Hollthurn', 407–10, 464
'Irma's injection', 94–107, 110, 124, 144, 146, 153, 159 *n.* 2, 240 *n.* 3, 260–3, 272–3, 276, 279, 282, 287, 305, 459, 477, 533, 593–4
Keeping a lady waiting, 146
Mother and daughter, 146
'Myops, my son, the', 238–9, 394–6
'*Non vixit*', 376–9, 422, 429–35, 459
One-eyed doctor and schoolmaster, 15, 244
Otto was looking ill, 239–40, 497, 501
Padua, the Restaurant Garden at, 13–14
Periodical for 20 florins, 146
Phantasies during sleep, 295–6
Pope is dead, 206
Professor Oser's dietary, 149 *n.*

Reconciliation with a friend, 128 *n.* 1, 426
Revolutionary dream (Count Thun), 184–93, 207, 385–7, 420
Riding on a horse (Boil), 203–6, 612
Rome, asking Herr Zucker the way to (Rome Series), 171–2
Rome, a street corner in (Rome Series), 172–3
Rome in a mist, view of (Rome Series), 171
Savonarola's profile, 148 *n.*
Social Democrats, communication from, 147
Son, news of, from the front, 499–501
Swimming pool, 586–7
Table d'hôte, company at, 576–80, 586, 587–8, 591–3, 604–5
Three Fates, 180–4, 206
Tiber, view of the (Rome Series), 171
Trottoir roulant, 589
Uncle with the yellow beard, 121–8, 146, 159 *n.* 2, 169–71, 261, 272, 287, 422, 433 *n.* 2, 510
Undressed, running up stairs, 211–13, 219
Villa Secerno, 282

B
DREAMT BY OTHERS

(The names or descriptions in brackets are the dreamer's followed by the reporter's.)

Achilles and Diomede (Son aged 8 – Freud), 115, 441, 584
Actor in full armour (Lady – Tausk), 368
Alexander the Great's dream (Alexander – Artemidorus), 88 *n.* 1, 548 *n.* 2
Applause in theatre (Playwright – Anon.), 612
Arrest in restaurant (Young man – Freud), 442–3
Asplenium and the lizards (Delboeuf – Delboeuf), 10–11, 319
Aussee, lake, trip across (Girl aged 3¼ – Freud), 115, 493, 583

Dream sources (*see* Important daytime impressions as dream sources; Trivial daytime events as dream sources)
Dream symbols (*see* Symbols)
Dream thoughts, latent
absurd dreams and, 383 *n.* 3, 386–91, 396–7, 402–3, 598–9
affect and, 411–13, 415–19, 420–2, 427, 433–6, 454, 497–8
childhood experiences as source of, 168–9, 175, 180, 193, 488, 594–5
censorship of, 286–7, 461, 473–4
concerned only with what is important, 526
condensation of, 248–53, 256–7, 260, 261–3, 452, 532–4, 586–90
day's residues and, 153–4, 157–8
displacement and, 272–5, 454, 590–3, 594–5
distortion of, in manifest content, 120, 125–6, 128 *n.* 1, 460, 527, 594
essential nature of, 277
expressed by numbers in dreams, 370–2
expressed by speeches in dreams, 374, 378–9, 601–2
feeling of reality in dream, part of, 333 *n.* 1
judgements on dream and, 166, 295, 397–8, 401–6, 410, 437
originate from normal mental life, 530
preconscious and, 240 *n.* 2, 484, 530–4
psychical intensity of, 293–4, 502, 532–3, 591
regression and, 485–6, 488, 490
relation to manifest content of, 105–6, 109, 246, 263, 272–5, 277, 293, 318, 453, 580–2, 590–1
repressed wish in, 216–17, 236, 420–1, 535, 542 *n.* 3
representation of, by the dream-work, 256–7, 277–88, 290–3, 299–300, 315, 352, 367, 595–7
secondary revision and, 437–41, 443, 446–7, 599–601
sexual material in, 354–7
somatic stimuli and, 210
uncovered by analysis of dream, 128, 153–4, 463, 466–71, 473–5, 580–1, 616
Dream thoughts, confused with dream, 453 *n.* 2
'Dream within a dream', 301, 515
Dreaming, recognition of the state of ('This is only a dream'), 301, 437–8, 511, 515, 611

Dreams
a form of thinking, 453 *n.* 2
absurd, 307 *n.* 2, 371–2, 380–97, 400–3, 459, 597–9, 603
alarm-clock, 23–6, 196
anxiety (*see* Anxiety dreams)
arousal, 23–6, 211 *n.* 1, 360, 443–5, 510–11, 515–17
biographical, 311–12, 325–7, 347 *n.* 2
birth, 334–7, 347 *n.* 1, 349–50, 357–61
children's (*see* Children's dreams)
consecutive, 469
'counterwish', 130–41
distressing, 119–21, 129, 135–42, 497–9, 607
during same night as part of same whole, 297–8, 310–11, 360, 397 *n.* 1, 469, 506–7
egoism of, 237–40, 287–8, 393–4, 433–4, 598–9
embarrassment in, 34, 211–13, 215–19, 234, 254, 299
emission in, 211 *n.* 1, 281, 298, 330–2, 347–8, 350, 353, 359–60
examination, 243–5, 344, 402–3, 425, 565–7
exhibitionist, 34, 211–13, 215–19, 234, 254, 299, 566
experimentally produced, 22–3, 27–31, 35, 37, 68, 110, 160 *n.* 2, 195, 343–4, 450, 527, 612
hypermnesic, 10–15, 51, 57, 527, 574
hypocritical, 128 *n.* 1, 356 *n.* 1, 423–7
impatient, 584
infantile, 117 *n.* 1, 118 *n.* 1, 168, 583–5, 607, 610
'innocent', 161–6, 176, 355–6, 359–60, 375, 602, 614
newly married couples', 71
Oedipus, 128 *n.* 1, 356–7, 565
of climbing, 253–7, 272, 291, 326
of convenience, xviii, 110–12, 142 *n.* 1, 207, 355, 359–60, 510–11, 584
of dead persons, 376–85, 389–91, 401–3, 455–6, 476–7, 492, 510
of death of loved person, 16, 71, 135–7, 220–30, 236–7, 384, 413–14, 499–501, 521–2, 565–6, 581, 607–8
of dreamer's own death, 404–6, 422–3, 427
of falling, 22, 34, 178–9, 241–2, 351–3, 527, 565
of fire, 353–4, 455–6, 476–7, 492, 510
of flying, 34, 201, 212, 241–2, 331, 345, 351–3, 521–2, 565
of missing a train, 344
of swimming, 351, 353, 354
of tooth extraction, 76, 200, 201, 346–51
pregnancy, 112, 359, 584
premonitory, 3, 4, 57, 63, 87, 555, 562–4, 574, 606
'prospective purpose' of, 453 *n.* 2, 518 *n.* 1
punishment, 423–5, 498–501
recurrent, 40 *n.* 1, 81, 127 *n.* 1, 168, 425, 518 *n.* 1, 615
rescue, 361
series of, 171–3, 219–20, 323, 469
sexual, 58, 71, 76, 175, 330–2, 354–5, 356, 542 *n.* 3, 613
staircase, 211–13, 219–20, 317, 325–7, 330–2, 344, 614
which are intelligible and make sense, 581–2, 591, 606
which are unintelligible and do not make sense (*see* Incoherence of dreams)
which make sense, but are bewildering, 581–2
wording of, as part of content, 189–7, 407 *n.* 2, 459

*Sigmund Freud in 1905 (*aet. *49)*

He wrote the following to Jung on September 2, 1907: 'I wish I were with you [. . .] telling you about my long years of honourable but painful solitude, which began after I cast my first glance into the new world, about the indifference and incomprehension of my closest friends, about the terrifying moments when I myself thought I had gone astray and was wondering how I might still make my misled life useful to my family, about my slowly growing conviction, which fastened itself to the interpretation of dreams as to a rock in a stormy sea, and about the serene certainty which finally took possession of me.'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

THE PSYCHOPATHOLOGY OF EVERYDAY LIFE

Forgetting, Slips of the Tongue, Bungled Actions, Superstitions and Errors

(1901)

Nun ist die Luft von solchem Spuk so voll,
Dass niemand weiss, wie er ihn meiden soll.
Faust, Part II, Act V, Scene 5

Now fills the air so many a haunting shape,
That no one knows how best he may escape.
(Bayard Taylor's translation)

1975 *PFL*, **5**. Pp. xxxvi + 346. (Same trans.)
2002 *PMC*. Pp. xlviii + 265. (Trans. Anthea Bell.)

The present translation is a revised and corrected reprint of the *SE* version.

Only one other of Freud's works, the *Introductory Lectures* (1916–17*a*), rivals this one in the number of German editions it has passed through and the number of foreign languages into which it has been translated.[1] In almost every one of its numerous editions fresh material was included in the book, and in this respect it might be thought to resemble *The Interpretation of Dreams* and the *Three Essays on the Theory of Sexuality*, to both of which Freud made constant additions throughout his life. But the cases have, in fact, no similarity. In these other two books the fresh material consisted for the most part of important enlargements or corrections of clinical findings and theoretical conclusions. In *The Psychopathology of Everyday Life* almost the whole of the basic explanations and theories were already present in the earliest editions;[2] the great mass of what was added later consisted merely in extra examples and illustrations (partly produced by Freud himself but largely by his friends and pupils) to throw further light upon what he had already discussed. No doubt he felt particular pleasure both in the anecdotes themselves and in being presented with such widespread confirmation of his views. But the reader cannot help feeling sometimes that the wealth of new examples interrupts and even confuses the main stream of the underlying argument. (See, for instance, pp. 58–69 and 167 *n.* below.)

Here, as in the case of Freud's books on dreams and on jokes but perhaps to a still
[xi] greater degree, the translator has to face the fact that a large proportion of the material to be dealt with depends on a play upon words which is totally untranslatable. In the first English translation the problem was dealt with in a drastic fashion by Brill; he omitted every example which involved terms that could not be rendered into English and inserted a certain number of examples of his own which illustrated similar points to the omitted ones. This was no doubt an entirely justifiable procedure in the circumstances. At the date at which Brill made his version, Freud's work was almost unknown in English-speaking countries, and it was important not to put up unnecessary obstacles to the circulation of this book which had been designed by Freud himself expressly for the general reader (cf. p. 233 *n.* 2). How well Brill succeeded in this aim is shown by the fact that by 1935 sixteen printings of his translation had been issued, and many more were to follow. His own examples, too, were for the most part excellent and two or three of them were in fact included by Freud in later editions of the German original. Nevertheless, there are obvious objections to perpetuating this situation, especially in any edition intended for more serious students of Freud's writings. In some instances, for example, the omission of a piece of Freud's illustrative material inevitably brought with it the omission of some important or interesting piece of theoretical comment. Moreover, though Brill announced in his preface his intention 'to modify or substitute some of the author's cases', in the text itself these substitutions are not as a rule explicitly indicated and the reader may sometimes be uncertain whether he is reading Freud or Brill. Brill's translation, it must be added, was made from the German edition of 1912 and remained unaltered in all the later reprints. Thus, it entirely passes over the very

1 Besides the English version of 1914, *The Psychopathology of Everyday Life* was during Freud's lifetime translated into Russian (1910), Polish (1912), Dutch (1916), French (1922), Spanish (1922), Hungarian (1923), Japanese (1930, two versions), Serbo-Croat (1937), Czech (1938), as well as Portuguese and Swedish (dates unspecified).

2 A few new points of theory were discussed in the last chapter of the later editions of the book.

numerous additions to the text made by Freud during the ten or more subsequent years. The total effect of the omissions due to these different causes is a startling one. Of the 305 pages of text of the latest major German edition, as printed in the *Gesammelte Werke*, between 90 and 100 (almost one third of the book, that is) had never appeared in English before the *SE* version was first published in 1960. The completeness of the present translation must, however, be weighed against the undoubted loss of readability caused by the *SE* and *RSE* policy of dealing with play upon words by the pedestrian method of giving the original German phrases and explaining their point with the help of square brackets and footnotes. [xii]

We find the first mention by Freud of a parapraxis[1] in a letter to Fliess of August 26, 1898 (Freud, 1950*a*, Letter 94). He there speaks of having 'at last grasped a little thing that I have long suspected'[2] – the way in which a name sometimes escapes one and a quite wrong substitute occurs to one in its place.[3] A month later, on September 22 (ibid., Letter 96), he gives Fliess another example, this time the familiar one of 'Signorelli', which he published that same year in a preliminary form in the *Monatsschrift für Psychiatrie und Neurologie* (1898*b*) and subsequently used for the first chapter of the present work. In the following year the same periodical published a paper by Freud on screen memories (1899*a*), *RSE*, **3**, a subject which he further discussed on rather different lines in Chapter IV below. But his time was fully occupied by the completion of *The Interpretation of Dreams* (1900*a*) and the preparation of his shorter study *On Dreams* (1901*a*) and it was not until late in 1900 that he took up *The Psychopathology of Everyday Life* seriously. In October of that year (Freud, 1950*a*, Letter 139) he asks leave from Fliess to use for the motto of his work the quotation from *Faust* which in fact appeared on its title page. On January 30, 1901 (Letter 141) he reports that it is 'at a standstill, half-finished, but will soon be continued',[4] and on February 15 (Letter 142) announces that he will finish it during the next few days. [xiii] It actually appeared in July and August in two issues of the same Berlin periodical as the preliminary studies.

Three years later, in 1904, the work was for the first time issued as a separate volume, with scarcely any alterations, but thereafter additions were made almost continuously over the next twenty years. In 1901 and 1904 it was in ten chapters. Two

1 In German, '*Fehlleistung*', 'faulty function' or 'faulty act'. It is a curious fact that before Freud wrote this book the general concept seems not to have existed in psychology, and in English a new word had to be invented to cover it. For a full discussion of this term, see *RSE*, **24**, 66–7.

2 References to the Fliess correspondence in the *RSE* are to the Bonaparte, A. Freud, E. Kris (1950*a*) edition, as translated by Mosbacher & Strachey (1954). See Preface to the Revised Edition, *RSE*, **1**, xxx.

3 Since Freud never used the example elsewhere, it may perhaps be repeated here, though its explanation is not given: 'This happened to me not long ago with the name of the author of *Andreas Hofer* ("Zu Mantua in Banden . . ."). It must, I felt sure, be something ending in "au" – Lindau, Feldau. The man was, of course, Julius Mosen [1803–67, dramatist and poet]; the "Julius" had not slipped my memory. I was able to show: (1) that I had repressed the name Mosen because of certain connections it had, (2) that infantile material played a part in this repression and (3) that the substitute names which had been interpolated had arisen, like symptoms, from the two groups of material. The analysis was perfectly complete, but unfortunately I cannot make it public any more than my big dream. . . .'

4 He had spent January in preparing the 'Dora' case history, though this was not in fact published for another four years (1905*e*), *RSE*, **7**, 7 ff.

more (what are now Chapters III and XI) were first added in 1907. An interleaved copy of the 1904 edition was found in Freud's library, in which he had made rough notes of further examples. The majority of these were incorporated in later editions: others, so far as they seem to be of interest, have been included here as footnotes at the appropriate point.

The special affection with which Freud regarded parapraxes was no doubt due to the fact that they, along with dreams, were what enabled him to extend to normal mental life the discoveries he had first made in connection with neuroses. For the same reason he regularly used them as the best preliminary material for introducing non-medical enquirers into the findings of psychoanalysis. This material was both simple and, on the surface at least, unobjectionable, as well as being concerned with phenomena which every normal person had experienced. In his expository writings he sometimes gave parapraxes a preference even over dreams, which involved more complicated mechanisms and tended to lead rapidly into deeper waters. Thus it was that he opened his great series of *Introductory Lectures* of 1916–17 with three devoted to parapraxes – in which, incidentally, many of the examples in the following pages make their reappearance; and he gave parapraxes similar priority in his contributions to *Scientia* (1913*j*), *RSE*, **13**, and to Marcuse's encyclopaedia (1923*a*), ibid., **18**. But though these phenomena were simple and easily explained, it was possible for Freud to demonstrate on them what was, after all, the fundamental thesis established in *The Interpretation of Dreams* – the existence of two distinct modes of mental functioning, what he described as the primary and secondary processes. Moreover, there was another fundamental belief of Freud's which could be convincingly supported by the examination of parapraxes – his belief in the universal application of determinism to
[xiv] mental events. This is the truth which he insists upon in the final chapter of the book: it should be possible in theory to discover the psychical determinants of every smallest detail of the processes of the mind. And perhaps the fact that this aim seemed more nearly attainable in the case of parapraxes was another reason why they had a peculiar attraction for Freud. Indeed, it was to this very point that he returned in the short paper on 'The Subtleties of a Faulty Action' (1935*b*), ibid., **22**, which was one of his latest writings.

I
THE FORGETTING OF PROPER NAMES[1]

In the 1898 volume of the *Monatsschrift für Psychiatrie und Neurologie* I published under the title of 'The Psychical Mechanism of Forgetfulness' [Freud, 1898*b*] a short paper the substance of which I shall recapitulate here and take as the starting point for more extensive discussions. In it I applied psychological analysis to the frequent circumstance of proper names being temporarily forgotten, by exploring a highly suggestive example drawn from my self-observation; and I reached the conclusion that this particular instance (admittedly commonplace and without much practical significance), in which a psychical function – the memory – refuses to operate, admits of an explanation much more far-reaching than that which the phenomenon is ordinarily made to yield. [1]

If a psychologist were asked to explain why it is that on so many occasions a proper name which we think we know perfectly well fails to enter our heads, he would, unless I am much mistaken, be satisfied with answering that proper names succumb more easily to the process of being forgotten than other kinds of memory content. He would bring forward the plausible reasons why proper names should thus be singled out for special treatment, but would not suspect that any other conditions played their part in such occurrences.

My close preoccupation with the phenomenon of names being temporarily forgotten arose out of my observation of certain characteristics which could be recognized sufficiently clearly in individual cases, though not, it is true, in all of them. These are cases in which a name is in fact not only *forgotten*, but *wrongly remembered.* In the course of our efforts to recover the name that has dropped out, other ones – *substitute names* – enter our consciousness; we recognize them at once, indeed, as incorrect, but they keep on returning and force themselves on us with great persistence. The process that should lead to the reproduction of the missing name has been so to speak *displaced* [*verschoben*][T] and has therefore led to an incorrect substitute. My hypothesis is that this displacement is not [2] *Verschiebung*

1 [*Vergessen von Eigennamen.* Apart from the very few alterations recorded below, the whole of this chapter dates back to 1901.]

left to arbitrary psychical choice but follows paths which can be predicted and which conform to laws. In other words, I suspect that the name or names which are substituted are connected in a discoverable way with the missing name: and I hope, if I am successful in demonstrating this connection, to proceed to throw light on the circumstances in which names are forgotten.

The name that I tried without success to recall in the example I chose for analysis in 1898 was that of the artist who painted the magnificent frescoes of the 'Four Last Things' in Orvieto cathedral.[1] Instead of the name I was looking for – *Signorelli* – the names of two other painters – *Botticelli* and *Boltraffio* – thrust themselves on me, though they were immediately and decisively rejected by my judgement as incorrect. When I learnt the correct name from someone else, I recognized it at once and without hesitation. The investigation into the influences and the associative paths by which the reproducing of the name had been displaced in this way from *Signorelli* to *Botticelli* and *Boltraffio* led to the following results:

(*a*) The reason why the name *Signorelli* was lost is not to be found in anything special about the name itself or in any psychological characteristic of the context into which it was introduced. The name I had forgotten was just as familiar to me as one of the substitute names – Botticelli – and much *more* familiar than the other substitute name – Boltraffio – about whose owner I could scarcely produce any information other than that he belonged to the Milanese school. Moreover, the context in which the name was forgotten seemed to me harmless and did not enlighten me further. I was driving in the company of a stranger from Ragusa in Dalmatia to a place in Herzegovina: our conversation turned to the subject of travel in Italy, and I asked my companion whether he had ever been to Orvieto and looked at the famous frescoes there, painted by . . .

(*b*) Light was only thrown on the forgetting of the name when I recalled
[3] the topic we had been discussing directly before, and it was revealed as a case in which *a topic that has just been raised is disturbed by the preceding topic*. Shortly before I put the question to my travelling companion whether he had ever been to Orvieto, we had been talking about the customs of the Turks living in *Bosnia* and *Herzegovina*. I had told him what I had heard from a colleague practising among those people – that they are accustomed to show great confidence in their doctor and great resignation to fate. If one has to inform them that

1 [The 'Four Last Things' are Death, Judgement, Hell and Heaven.]

nothing can be done for a sick person, their reply is: '*Herr* [Sir], what is there to be said? If he could be saved, I know you would have saved him.' In these sentences we for the first time meet with the words and names *Bosnia*, *Herzegovina* and *Herr*, which can be inserted into an associative series between *Signorelli* and *Botticelli – Boltraffio*.

(*c*) I assume that the series of thoughts about the customs of the Turks in Bosnia, etc., acquired the capacity to disturb the next succeeding thought from the fact that I had withdrawn my attention from that series before it was brought to an end. I recall in fact wanting to tell a second anecdote which lay close to the first in my memory. These Turks place a higher value on sexual enjoyment than on anything else, and in the event of sexual disorders they are plunged in a despair which contrasts strangely with their resignation towards the threat of death. One of my colleague's patients once said to him: '*Herr*, you must know that if *that* comes to an end then life is of no value.' I suppressed my account of this characteristic trait, since I did not want to allude to the topic[I] in a conversation with a stranger. But I did more: I also diverted my attention from pursuing thoughts which might have arisen in my mind from the topic of 'death and sexuality'. On this occasion I was still under the influence of a piece of news which had reached me a few weeks before while I was making a brief stay at *Trafoi*.[2] A patient over whom I had taken a great deal of trouble had put an end to his life on account of an incurable sexual disorder. I know for certain that this melancholy event and everything related to it was not recalled to my conscious memory during my journey to Herzegovina. But the similarity between 'Trafoi' and 'Boltraffio' forces me to assume that this reminiscence, in spite of my [4]
attention being deliberately diverted from it, was brought into operation in me at the time [of the conversation].

(*d*) It is no longer possible for me to take the forgetting of the name *Signorelli* as a chance event. I am forced to recognize the influence of a *motive* [*Motivs*][T] in the process. It was a motive which caused me to interrupt myself while recounting what was in my mind (concerning the customs of the Turks, etc.), and it was a motive which further influenced me so that I debarred the thoughts connected with them, the thoughts which had led to the news at Trafoi, from becoming conscious in my mind. I wanted, therefore, to forget something; I had *repressed* [*verdrängt*][T] something. What I wanted to forget was not, it is true, the *Verdrängung*
name of the artist at Orvieto but something else – something, however,

1 [In all the editions before 1924 this read 'the delicate topic'.]

2 [A hamlet in the Tyrol.]

which contrived to place itself in an associative connection with his name, so that my act of will missed its target and I forgot *the one thing against my will*, while I wanted to forget *the other thing intentionally*. The disinclination to remember was aimed against one content; the inability to remember emerged in another. It would obviously be a simpler case if disinclination and inability to remember related to the same content. Moreover, the substitute names no longer strike me as so entirely unjustified as they did before the matter was elucidated: by a sort of compromise they remind me just as much of what I wanted to forget as of what I wanted to remember; and they show me that my intention to forget something was neither a complete success nor a complete failure.[1]

(*e*) The way in which the missing name and the repressed topic (the topic of death and sexuality, etc., in which the names of Bosnia, Herzegovina and Trafoi appeared) became linked is very striking. The schematic diagram which I have inserted at this point, and which is repeated from the 1898 paper [Fig. 1], aims at giving a clear picture of this.

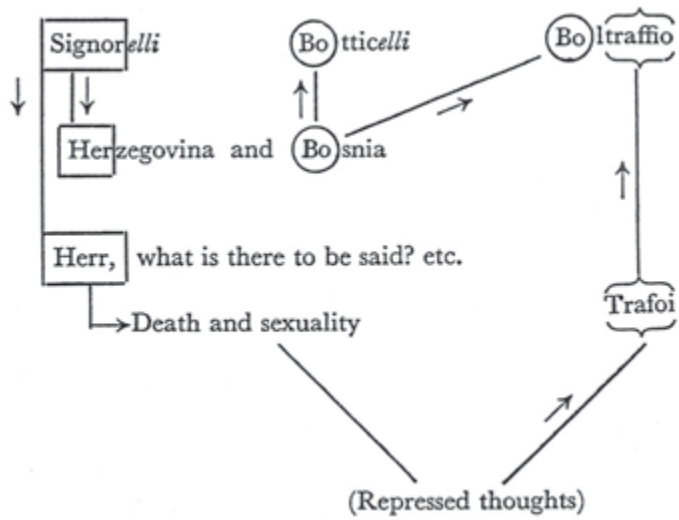

Fig. 1

The name *Signorelli* has undergone a division into two pieces. One of the pairs of syllables (*elli*) recurs without alteration in one of the substitute names: while the other, by means of the translation of *Signor* into *Herr*, has acquired a numerous and miscellaneous set of relations to the [5] names contained in the repressed topic, but for this reason it is not

1 [In 1901 only, the sentence ended: 'my intention to forget something was not a complete success'.]

available for [conscious] reproduction. The substitute for it [for *Signor*] has been arrived at in a way that suggests that a displacement along the connected names of '*Herz*egovina and *Bo*snia'[1] had taken place, without consideration for the sense or for the acoustic demarcation of the syllables. Thus the names have been treated in this process like the pictograms in a sentence which has had to be converted into a picture-puzzle (or rebus). Of the whole course of events that have in ways like these produced the substitute names instead of the name *Signorelli* no information has been given to consciousness. At first sight it seems impossible to discover any relation between the topic in which the name *Signorelli* occurred and the repressed topic which preceded it in time, apart from this recurrence of the same syllables (or rather sequence of letters).

Perhaps it is not superfluous to remark that the conditions which psychologists assume to be necessary for reproducing and for forgetting, and which they look for in certain relations and dispositions,[2] are not inconsistent with the above explanation. All we have done is, in certain [6]
cases, to add a *motive* to the factors that have been recognized all along as being able to bring about the forgetting of a name; and, in addition, we have elucidated the mechanism of false recollection (paramnesia). These dispositions are indispensable to our case as well, in order to make it possible for the repressed element to get hold of the missing name by association and draw it with itself into repression. In the case of another name with more favourable conditions for reproduction this perhaps would not happen. It is probable indeed that a suppressed element always strives to assert itself elsewhere, but is successful in this only when suitable conditions meet it halfway. At other times the suppression succeeds without any functional disturbance, or, as we can justly say, without any *symptom*.

The conditions necessary for forgetting a name, when forgetting it is accompanied by paramnesia [*Fehlerinnern*], may then be summarized as follows: (1) a certain disposition for forgetting the name, (2) a process of suppression carried out shortly before, (3) the possibility of establishing an *external* association between the name in question and the element previously suppressed. The difficulty of fulfilling the last condition need probably not be rated very high, since, considering the low standards expected of an association of this kind, one could be established in the great majority of cases. There is, however, the profounder question

1 [These two portions of the Austro-Hungarian monarchy used to be habitually spoken of together, almost as though they formed a single word.]

2 [I.e. 'mental traces'. See Stout, 1938, 21.]

whether an external association like this can really be a sufficient condition for the repressed element's disturbing the reproduction of the lost name – whether some more intimate connection between the two topics is not required. On a superficial consideration one would be inclined to reject the latter demand, and accept as sufficient a temporal contiguity between the two, even if the contents are completely different. On close enquiry, however, one finds more and more frequently that the two elements which are joined by an external association (the repressed element and the new one) possess in addition some connection of content; and such a connection is in fact demonstrable in the *Signorelli* example.[1]

[7] The value of the insight that we have gained in analysing the *Signorelli* example naturally depends on whether we want to pronounce that instance as typical or as an isolated occurrence. I must affirm, then, that the forgetting of names, accompanied by paramnesia, takes place with uncommon frequency in the way in which we have explained it in the *Signorelli* case. In almost every instance in which I could observe this phenomenon in myself, I have also been able to explain it in the way described above, i.e. as motivated by repression. I must also draw attention to another consideration which supports the typical nature of our analysis. I think there is no justification for making a theoretical separation between those cases in which the forgetting of names is accompanied by paramnesia and the sort where incorrect substitute names have not presented themselves.[2] These substitute names occur spontaneously in a number of cases; in others, where they have not emerged spontaneously, it is possible to force them to emerge by an effort of attention; and they then show the same relation to the repressed element and to the missing name as they would if they had appeared spontaneously. Two factors seem to be decisive in bringing the substitute names to consciousness: first, the effort of attention, and second, an inner condition that attaches to the psychical material. We might look for the latter in the greater or lesser facility with which the necessary external association between the two elements establishes itself. A good portion of the cases of name-forgetting *without* paramnesia can thus be added to the cases in which substitute names are formed – to which the mechanism of the *Signorelli* example applies. I shall, however, certainly not venture to affirm that all cases of name-forgetting are to be classed in

1 [See footnote 1, p. 12 below.]

2 [Freud returns to this question in the next chapter, p. 11 below.]

the same group. There is no question that instances of it exist which are much simpler. We shall, I think, have stated the facts of the case with sufficient caution[1] if we affirm: *Alongside simple cases where proper names are forgotten there is a type of forgetting which is motivated by repression.*

1 [In 1901 only, 'correctly' appears instead of 'with sufficient caution'. – A short account of the *Signorelli* example was given by Freud in a letter to Fliess of September 22, 1898 (Freud, 1950*a*, Letter 96), immediately on his return to Vienna from the trip along the Dalmatian coast during which the episode occurred.]

II
THE FORGETTING OF FOREIGN WORDS[1]

[8] The current vocabulary of our own language, when it is confined to the range of normal usage, seems to be protected against being forgotten.[2] With the vocabulary of a foreign language it is notoriously otherwise. The disposition to forget it extends to all parts of speech, and an early stage in functional disturbance is revealed by the fluctuations in the control we have over our stock of foreign words – according to the general condition of our health and to the degree of our tiredness. In a number of cases this kind of forgetting exhibits the same mechanism disclosed to us by the *Signorelli* example. In proof of this I shall give only a single analysis, one which is distinguished, however, by some useful characteristics: it concerns the forgetting of a non-substantival word in a Latin quotation. Perhaps I may be allowed to present a full and clear account of this small incident.

[9] Last summer – it was once again on a holiday trip – I renewed my acquaintance with a certain young man of academic background. I soon found that he was familiar with some of my psychological publications. We had fallen into conversation – how I have now forgotten – about the social status of the race to which we both belonged; and ambitious feelings prompted him to give vent to a regret that his generation was doomed (as he expressed it) to atrophy, and could not develop its talents or satisfy its needs. He ended a speech of impassioned fervour with the

1 [Apart from the change recorded in footnote 2 below, a new footnote on p. 11, and a short addition to footnote 3 on pp. 11–12, the whole of this chapter dates back to 1901.]

2 [In 1901 and 1904 there was at this point a long footnote. It began: 'I am doubtful whether frequency of use can by itself account for this protection. I have at any rate observed that first names, which do not have the same restricted application that proper names [i.e. surnames] have, are just as liable to be forgotten as the latter.' This was followed by the example now to be found in Chapter III, p. 21 below (forgetting the first name of a woman patient's brother). The footnote continued: 'A suppressed thought about oneself or one's own family frequently provides the motive for forgetting a name, as if one were constantly making comparisons between oneself and other people. [Cf. p. 21 f.] The most curious instance of this sort was reported to me by a Herr Lederer . . .' The example now to be found in Chapter III, p. 22 f., was then cited. In 1907 a new chapter, on the forgetting of names and sets of words, was added to the book (the present Chapter III); these two examples were transferred to it, and the rest of the footnote disappeared.]

well-known line of Virgil's in which the unhappy Dido commits to posterity her vengeance on Aeneas: '*Exoriare* . . .' Or rather, he *wanted* to end it in this way, for he could not get hold of the quotation and tried to conceal an obvious gap in what he remembered by changing the order of the words: '*Exoriar*(*e*) *ex nostris ossibus ultor.*' At last he said irritably: 'Please don't look so scornful: you seem as if you were gloating over my embarrassment. Why not help me? There's something missing in the line; how does the whole thing really go?'

'I'll help you with pleasure,' I replied, and gave the quotation in its correct form: '*Exoriar*(*e*) *ALIQUIS nostris ex ossibus ultor*.'[1]

'How stupid to forget a word like that! By the way, you claim that one never forgets a thing without some reason. I should be very curious to learn how I came to forget the indefinite pronoun "*aliquis*" in this case.'

I took up this challenge most readily, for I was hoping for a contribution to my collection. So I said: 'That should not take us long. I must only ask you to tell me, *candidly* and *uncritically*, whatever comes into your mind if you direct your attention to the forgotten word without any definite aim.'[2]

'Good. There springs to my mind, then, the ridiculous notion [*Einfall*]T of dividing up the word like this: *a* and *liquis*.'

'What does that mean?' – 'I don't know.' – 'And what occurs to you next?' – 'What comes next is *Reliquien* [relics], *liquefying*, *fluidity*, *fluid.* Have you discovered anything so far?'

'No. Not by any means yet. But go on.'

'I am thinking', he went on with a scornful laugh, 'of *Simon of Trent*, [10] whose relics I saw two years ago in a church at Trent. I am thinking of the accusation of ritual blood sacrifice which is being brought against the Jews again just now, and of *Kleinpaul's* book [1892] in which he regards all these supposed victims as incarnations, one might say new editions, of the Saviour.'

'The notion is not entirely unrelated to the subject we were discussing before the Latin word slipped your memory.'

'True. My next thoughts are about an article that I read lately in an Italian newspaper. Its title, I think, was "What St *Augustine* says about Women". What do you make of that?'

'I am waiting.'

1 [Virgil, *Aeneid*, IV, 625. Literally 'Let someone (*aliquis*) arise from my bones as an avenger!']

2 This is the general method of introducing concealed ideational elements to consciousness. Cf. my *Interpretation of Dreams* (1900*a*), *RSE*, **4**, 90.

'And now comes something that is quite clearly unconnected with our subject.'

'Please refrain from any criticism and –'

'Yes, I understand. I am thinking of a fine old gentleman I met on my travels last week. He was a real *original*, with all the appearance of a huge bird of prey. His name was *Benedict*, if it's of interest to you.'

'Anyhow, here are a row of saints and Fathers of the Church: St *Simon*, St *Augustine*, St *Benedict*. There was, I think, a Church Father called *Origen*. Moreover, three of these names are also first names, like *Paul* in *Kleinpaul*.'

'Now it's St *Januarius* and the miracle of his blood that comes into my mind – my thoughts seem to me to be running on mechanically.'

'Just a moment: St *Januarius* and St *Augustine* both have to do with the calendar. But won't you remind me about the miracle of his blood?'

'Surely you must have heard of that? They keep the blood of St Januarius in a phial inside a church at Naples, and on a particular holy day it miraculously *liquefies*. The people attach great importance to this miracle and get very excited if it's delayed, as happened once at a time when the French were occupying the town. So the general in command – or have I got it wrong? was it Garibaldi? – took the reverend gentleman aside and gave him to understand, with an unmistakable gesture towards the soldiers posted outside, that he *hoped* the miracle would take place very soon. And in fact it did take place . . .'

'Well, go on. Why do you pause?'

[11] 'Well, something *has* come into my mind . . . but it's too intimate to pass on. . . . Besides, I don't see any connection, or any necessity for saying it.'

'You can leave the connection to me. Of course I can't force you to talk about something that you find distasteful; but then you mustn't insist on learning from me how you came to forget your *aliquis*.'

'Really? Is that what you think? Well then, I've suddenly thought of a lady from whom I might easily hear a piece of news that would be very awkward for both of us.'

'That her periods have stopped?'

'How could you guess that?'

'That's not difficult any longer; you've prepared the way sufficiently. Think of *the calendar saints, the blood that starts to flow on a particular day, the disturbance when the event fails to take place, the open threats that the miracle must be vouchsafed, or else* . . . In fact you've made use of the miracle of St Januarius to manufacture a brilliant allusion to women's periods.'

'Without being aware of it. And you really mean to say that it was this anxious expectation that made me unable to produce an unimportant word like *aliquis*?'

'It seems to me undeniable. You need only recall the division you made into *a-liquis*, and your associations: *relics*, *liquefying*, *fluid*. St Simon was *sacrificed as a child* – shall I go on and show how he comes in? You were led on to him by the subject of relics.'

'No, I'd much rather you didn't. I hope you don't take these thoughts of mine too seriously, if indeed I really had them. In return I will confess to you that the lady is Italian and that I went to Naples with her. But mayn't all this just be a matter of chance?'

'I must leave it to your own judgement to decide whether you can explain all these connections by the assumption that they are matters of chance. I can however tell you that every case like this that you care to analyse will lead you to "matters of chance" that are just as striking.'[1]

I have several reasons for valuing this brief analysis; and my thanks are [12]
due to my former travelling companion who presented me with it. In the first place, this is because I was in this instance allowed to draw on a source that is ordinarily denied to me. For the examples collected here of disturbances of a psychical function in daily life I have to fall back mainly on self-observation. I am anxious to steer clear of the much richer material provided by my neurotic patients, since it might otherwise be objected that the phenomena in question are merely consequences and manifestations of neurosis.[2] My purpose is therefore particularly well served when a person other than myself, not suffering from nervous illness, offers himself as the object of such an investigation. This analysis is significant in a further respect: it throws light on the case of a word being forgotten *without* a substitute for it appearing in the memory. It thus confirms my earlier assertion [p. 6 f. above] that the appearance or non-appearance in the memory of incorrect substitutes cannot be made the basis for any radical distinction.[3]

1 [*Footnote added* 1924:] This short analysis has received much attention in the literature of the subject and has provoked lively discussion. Basing himself directly on it, Bleuler (1919) has attempted to determine mathematically the credibility of psychoanalytic interpretations, and has come to the conclusion that it has a higher probability value than thousands of medical 'truths' which have gone unchallenged, and that it owes its exceptional position only to the fact that we are not yet accustomed to take psychological probabilities into consideration in science.

2 [Cf. Freud's similar remarks on the subject of his choice of dreams for analysis in his Preface to the first edition of *The Interpretation of Dreams* (*RSE*, **4**, xxvii).]

3 Closer scrutiny somewhat diminishes the contrast between the analyses of *Signorelli* and of *aliquis* in regard to substitutive memories. In the latter example too it appears that the forgetting was accompanied by a substitutive formation. When subsequently I asked my companion whether

[13] The chief importance, however, of the *aliquis* example lies in another of the ways in which it differs from the *Signorelli* specimen. In the latter, the reproducing of a name was disturbed by the after-effect of a train of thought begun just before and then broken off, whose content, however, had no clear connection with the new topic containing the name of Signorelli. Contiguity in time furnished the only relation between the repressed topic and the topic of the forgotten name; but this was enough to enable the two topics to find a connection in an external association.[1] Nothing, on the other hand, can be seen in the *aliquis* example of an independent repressed topic of this sort, which had engaged conscious thinking directly before and then left its echoes in a disturbance. The disturbance in reproduction occurred in this instance from the very [14] nature of the topic hit upon in the quotation, since opposition unconsciously arose to the wishful idea expressed in it. The circumstances must be construed as follows. The speaker had been deploring the fact that the present generation of his people was deprived of its full rights; a new generation, he prophesied like Dido, would inflict vengeance on the

in the course of his efforts to recall the missing word no substitute whatever came into his mind, he reported that at first he had felt a temptation to introduce an *ab* into the line (perhaps the detached portion of *a-liquis*) – *nostris ab ossibus*; and he went on to say that the *exoriare* had thrust itself on him with peculiar clarity and obstinacy, 'evidently', he added with his characteristic scepticism, 'because it was the first word in the line'. When I asked him to attend all the same to the associations starting from *exoriare*, he produced *exorcism*. I can therefore very well believe that the intensification of *exoriare* when it was reproduced actually had the value of a substitutive formation of this sort. This substitute would have been arrived at from the names of the saints via the association 'exorcism'. These however are refinements to which one need attach no importance. [The next two sentences were added in 1924:] (On the other hand, Wilson (1922) stresses the fact that the intensification of *exoriare* is of great significance to the understanding of the case, since exorcism would be the best symbolic substitute for repressed thoughts about getting rid of the unwanted child by abortion. I gratefully accept this correction, which does not weaken the validity of the analysis.) It seems possible, however, that the appearance of any kind of substitute memory is a constant sign – even though perhaps only a characteristic and revealing sign – of tendentious forgetfulness which is motivated by repression. It would seem that substitutive formation occurs even in cases not marked by the appearance of incorrect names as substitutes, and that in these it lies in the intensification of an element that is closely related to the forgotten name. For example, in the *Signorelli* case, so long as the painter's name remained inaccessible, the visual memory that I had of the series of frescoes and of the self-portrait which is introduced into the corner of one of the pictures was *ultra-clear* – at any rate much more intense than visual memory traces normally appear to me. In another case, also described in my 1898 paper, which concerned a visit which I was very reluctant to pay to an address in a strange town, I had forgotten the name of the street beyond all hope of recovery, but my memory of the house number, as if in derision, was ultra-clear, whereas normally I have the greatest difficulty in remembering numbers. [Cf. pp. 36 f. and 229 below.]

1 I am not entirely convinced of the absence of any internal connection between the two groups of thoughts in the *Signorelli* case. After all, if the repressed thoughts on the topic of death and sexual life are carefully followed up, one will be brought face to face with an idea that is by no means remote from the topic of the frescoes at Orvieto. – [Dr Richard Karpe has suggested that there may be a connection here with the visit to an Etruscan tomb near Orvieto mentioned in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 406. See also Freud's earlier paper (1898*b*), ibid., **3**, 284.]

oppressors. He had in this way expressed his wish for descendants. At this moment a contrary thought intruded. 'Have you really so keen a wish for descendants? That is not so. How embarrassed you would be if you were to get news just now that you were to expect descendants from the quarter you know of. No: no descendants – however much we need them for vengeance.' This contradiction then asserts itself by exactly the same means as in the *Signorelli* example – by setting up an external association between one of its ideational elements [*Vorstellungselemente*][T] and an element in the wish that has been repudiated; this time, indeed, it does so in a most arbitrary fashion by making use of a roundabout associative path which has every appearance of artificiality. A second essential in which the present case agrees with the *Signorelli* instance is that the contradiction has its roots in repressed sources and derives from thoughts that would lead to a diversion of attention.

Vorstellung

So much for the dissimilarity and the inner affinity between these two typical specimens of the forgetting of words.[1] We have got to know a second mechanism of forgetting – the disturbance of a thought by an internal contradiction which arises from the repressed. Of the two processes this is, I think, the easier to understand; and we shall repeatedly come across it again in the course of this discussion.

1 [Freud writes '*Namenvergessen*' – 'the forgetting of names': but this is doubtless an oversight.]

III

THE FORGETTING OF NAMES AND SETS OF WORDS[1]

[15] Observations such as those mentioned above [Chapter II], of what happens when a portion of a set of words in a foreign tongue is forgotten, may make us curious to know whether the forgetting of sets of words in our own language demands an essentially different explanation. We are not usually surprised, it is true, if a formula learnt by heart, or a poem, can be reproduced only inaccurately some time later, with alterations and omissions. Since, however, this forgetting does not have a uniform effect on what has been learnt as a whole but seems on the contrary to break off isolated portions of it, it may be worth the trouble to submit to analytic investigation a few instances of such faulty reproduction.

A younger colleague of mine told me in conversation that he thought it likely that the forgetting of poetry in one's own language could very well have motives similar to the forgetting of single elements from a set of words in a foreign tongue. At the same time he offered to be the subject of an experiment. I asked him on what poem he would like to make the test, and he chose 'Die Braut von Korinth',[2] a poem of which he was very fond and of which he thought he knew at least some stanzas by heart. At the beginning of his reproduction he was overcome by a rather remarkable uncertainty. 'Does it run "Travelling from Corinth to Athens",' he asked, 'or "Travelling to Corinth from Athens"?' I also had a moment's hesitation, until I laughingly observed that the title of the poem 'The Bride of Corinth' left no doubt which way the young man was travelling. The reproduction of the first stanza then proceeded smoothly or at any rate without any striking falsifications. My colleague seemed
[16] to search for a while for the first line of the second stanza; he soon continued, and recited as follows:

1 [This chapter was added to the book in 1907. Much new material was included in it later, as can be found specified below. The earlier portion, up to p. 17, dates from 1907.]

2 ['The Bride of Corinth', Goethe's ballad.]

Aber wird er auch willkommen scheinen,
Jetzt, wo jeder Tag was Neues bringt?
Denn er ist noch Heide mit den Seinen
Und sie sind Christen und – getauft.[1]

Before he reached this point I had already pricked up my ears in surprise; and after the end of the last line we were both in agreement that some distortion had occurred here. But as we did not succeed in correcting it, we hurried to the bookcase to get hold of Goethe's poems, and found to our surprise that the second line of the stanza had a completely different wording, which had, as it were, been expelled from my colleague's memory and replaced with something that did not seem to belong. The correct version runs:

Aber wird er auch willkommen scheinen,
Wenn er teuer nicht die Gunst erkauft?[2]

'*Getauft*' ['baptized', two lines below] rhymes with '*erkauft*', and it struck me as singular that the connected group of 'heathen', 'Christian' and 'baptized' should have given him so little help in restoring the text.

'Can you explain,' I asked my colleague, 'how you have so completely expunged a line in a poem that you claim you know so well, and have you any notion from what context you can have taken the substitute?'

He was in a position to provide an explanation, though obviously with some reluctance. 'The line "Jetzt, wo jeder Tag was Neues bringt" seems familiar to me; I must have used the words a short time ago in referring [17]
to my practice – as you know, I am highly satisfied with its progress at the present time. But how does the sentence fit in here? I could think of a connection. The line "Wenn er teuer nicht die Gunst erkauft" was obviously one which I found disagreeable. It is connected with a proposal of marriage which was turned down on the first occasion, and which, in view of the great improvement in my material position, I am now

1 [Literally: 'But will he in fact seem welcome,
Now, when every day brings something new?
For he is still a heathen with his kindred
And they are Christians and baptized.'
In addition to the introduction of the completely alien second line, which is discussed in the next paragraph, the third and fourth lines have been slightly misquoted. They should run:
'Er ist noch ein Heide mit den Seinen
Und sie sind schon Christen und getauft.'
('He is still a heathen with his kindred
And they are already Christians and baptized.')]

2 ['But will he in fact seem welcome *if he does not buy the favour dearly*?']

thinking of repeating. I cannot tell you any more, but if I am accepted now, it certainly cannot be enjoyable for me to reflect that some sort of calculation tipped the scale both then and now.'

This struck me as intelligible, even without my needing to know further particulars. But I continued with my questions: 'How in any case have you and your private affairs become involved in the text of the "Bride of Corinth"? Is yours perhaps a case that involves differences in religious belief like those that play an important part in the poem?'

(Keimt ein Glaube neu,
Wird oft Lieb' und Treu
Wie ein böses Unkraut ausgerauft.)[1]

My guess was wrong; but it was curious to see how a single well-aimed question gave him a sudden perspicacity, so that he was able to bring me as an answer something of which he had certainly been unaware up to that time. He gave me a pained, even an indignant look, muttered a later passage from the poem:

Sieh sie an genau!
Morgen ist sie grau.[2]

[18] and added shortly: 'She is rather older than me.' To avoid distressing him further I broke off the enquiry. The explanation struck me as sufficient. But it was certainly surprising that the attempt to trace a harmless failure of memory back to its cause should have had to come up against matters in the subject's private life that were so remote and intimate, and that were cathected [*besetzte*][T] with such distressing affect.

Besetzung

1 ['When a faith is newly sprung up, love and troth are often torn out like an evil weed.']

2 ['Look on her carefully. Tomorrow she will be grey.'] My colleague has incidentally made changes in this beautiful passage from the poem, somewhat altering both the wording and what the words refer to. The ghostly maiden says to her bridegroom:

'Meine Kette hab' ich dir gegeben;
Deine Locke nehm' ich mit mir fort.
Sieh sie an genau!
Morgen bist du grau,
Und nur braun erscheinst du wieder dort.'

['My necklace I have given thee; your lock of hair I take away with me. Look on it carefully. Tomorrow you will be grey, and you will appear brown again only there.' (The context shows that 'sie' ('it' or 'her') in the third line refers to the lock of hair. In a different context the line could mean: 'Look on her carefully'.)]

Here is another instance, given by Jung (1907, 64), of the forgetting of a set of words in a well-known poem. I shall quote the author's own words.

'A man was trying to recite the well-known poem that begins "*Ein Fichtenbaum steht einsam . . .*"[1] In the line beginning "*Ihn schläfert*"[2] he became hopelessly stuck; he had completely forgotten the words "*mit weisser Decke* [with a white sheet]". Forgetting something in so familiar a verse struck me as surprising, and I therefore made him reproduce what occurred to him in connection with "*mit weisser Decke*". He had the following train of associations: "A white sheet makes one think of a shroud – a linen sheet to cover a dead body" – (a pause) – "now a close friend occurs to me – his brother died recently quite suddenly – he is supposed to have died of a heart attack – he was *also* very stout – my friend is *also* stout, and I have thought before now that it might *also* happen to him – probably he takes too little exercise – when I heard of his brother's death I suddenly became anxious that it might *also* happen to me; for in our family we have in any case a tendency to fatness, and my grandfather, too, died of a heart attack; I have noticed that I too am over-stout and I have therefore begun a course of slimming recently."

'Thus,' comments Jung, 'the man had, unconsciously, identified himself at once with the fir-tree wrapped in the white shroud.' [19]

The following example[3] of the forgetting of a set of words, which I owe to my friend[4] Sándor Ferenczi of Budapest, differs from the preceding ones in that it concerns a phrase coined by the subject himself and not a sentence taken from a writer. It may also present us with the somewhat unusual case in which the forgetting ranges itself on the side of our good sense, when the latter threatens to succumb to a momentary desire. The parapraxis thus comes to serve a useful function. When we have sobered down once more we appreciate the rightness of this internal current, which had previously only been able to express itself in a failure [*Versagen*][T] to function – a forgetting, a psychical impotence. *Versagung*

1 ['A fir-tree stands alone.' Heine, *Lyrisches Intermezzo*, XXXIII.]

2 [The relevant lines are:

Ihn schläfert; mit weisser Decke
Umhüllen ihn Eis und Schnee.

He slumbers; with a white sheet
Ice and snow cover him.]

3 [This paragraph and the four following ones were added in 1910.]

4 [In 1910 only, the word used was 'colleague'.]

'At a social gathering someone quoted "*Tout comprendre c'est tout pardonner*". I made the comment that the first part of the sentence was enough; "pardoning" was a piece of arrogance: it should be left to God and the priests. One of those present thought this observation very good, and this emboldened me to say – probably with the intention of securing the good opinion of the benevolent critic – that I had recently thought of something better. But when I tried to repeat it I found it had escaped me. I immediately withdrew from the company and wrote down the screen
Deckerinnerung associations[1] [*Deckeinfälle*][T]. There first occurred to me the names of the friend and of the street in Budapest that witnessed the birth of the idea I was looking for; next came the name of another friend, Max, whom we usually call Maxi. This led me to the word "maxim" and to the recollection that what we were after was, like my original remark, a variation on a well-known maxim. Strangely enough my next thought was not a maxim but the following sentence: "God created man in His own image" and the same idea in reverse: "Man created God in his." Thereupon the memory of what I was looking for immediately appeared. On that occasion my friend had said to me in Andrássy Street: "Nothing human is foreign to me", whereupon I had answered, in allusion to the
[20] discoveries of psychoanalysis: "You ought to have gone further and have admitted that nothing animal is foreign to you."

'But after I had at last remembered what I wanted, I was less than ever able to repeat it in the company I happened to be in. The young wife of the friend whom I had reminded of the animal nature of the unconscious was among those present, and I had to recognize that she was by no means prepared to receive such disagreeable truths. My forgetting spared me a number of unpleasant questions from her and a pointless discussion. This and nothing else must have been the motive for my "temporary amnesia".

'It is interesting that a screen association was provided by a sentence in which the Deity is debased to the status of a human invention, while in the missing sentence there is an allusion to the animal in man. *Capitis diminutio* [i.e. deprivation of one's status] is therefore the element common to both. The whole subject is clearly only the continuation of the train of thought about understanding and forgiving which the conversation had instigated.

'The fact that what I was looking for in this case was so quick in presenting itself may perhaps be due also to my immediate withdrawal from the company where it was censored to an empty room.'

1 [I.e. the substitute ideas.]

I have since[1] undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of '*aliquis*' [p. 8 above] and 'The Bride of Corinth' [p. 14] has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought content – a thought content which is the source of the effect [21] manifested in the form of forgetting.

I now return to the forgetting of names. So far we have not exhaustively considered either the case material or the motives behind it. As this is exactly the kind of parapraxis that I can from time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of migraine from which I still suffer[2] usually announce themselves hours in advance by my forgetting names, and at the height of these attacks, during which I am not forced to abandon my work, it frequently happens that all proper names go out of my head. Now it is precisely cases like mine which could furnish the grounds for an objection on principle to our analytic efforts. Should it not necessarily be concluded from such observations that the cause of forgetfulness, and in particular of the forgetting of names, lies in circulatory and general functional disturbances of the cerebrum, and should we not therefore spare ourselves the search for psychological explanations of these phenomena? Not at all, in my view; that would be to confuse the mechanism of a process, which is of the same kind in all cases, with the factors favouring the process, which are variable and not necessarily essential. Instead of a discussion, however, I shall bring forward an analogy to deal with the objection.

Let us suppose that I have been imprudent enough to go for a walk at night in a deserted quarter of the city, and have been attacked and robbed of my watch and purse. I report the matter at the nearest police station in the following words: 'I was in such and such a street, and there *loneliness* and *darkness* took away my watch and purse.' Although I should not

1 [What follows from this point until p. 23 dates from 1907, with the exception of the two passages on pp. 21–2 and 22–3.]

2 [Freud suffered from migraine throughout his life. Cf. Jones, 1953, 339.]

have said anything in this statement that was not true, the wording of my report would put me in danger of being thought not quite right in the head. The state of affairs could only be described correctly by saying that *favoured* by the loneliness of the place and under the *shield* of darkness *unknown malefactors* robbed me of my valuables. Now the state of affairs in the forgetting of names need not be any different; favoured by
[22] tiredness, circulatory disturbances and intoxication, an unknown psychical force [*Macht*][T] robs me of my access to the proper names belonging to my memory – a force which can in other cases bring about the same failure of memory at a time of perfect health and unimpaired efficiency.[I]

If I analyse the cases of the forgetting of names that I observe in myself, I almost always find that the name which is withheld from me is related to a topic of close personal importance to me, and one which is capable of evoking in me strong and often distressing affects. In accordance with the convenient and commendable practice of the Zürich school (Bleuler, Jung, Riklin) I can also formulate this fact as follows: The lost name has touched on a 'personal complex' in me.[2] The relation of the name to myself is one that I should not have expected and is usually arrived at through superficial associations (such as verbal ambiguity or similarity in sound); it can be characterized quite generally as an oblique relation. Its nature will best be illustrated by some simple examples.

(1) A patient asked me to recommend him a health resort on the Riviera. I knew of such a resort quite close to Genoa, and I also remembered the name of a German colleague of mine who practised there; but the name of the resort itself escaped me, well as I thought I knew that too. There was nothing left for me but to ask the patient to wait while I hurriedly consulted the ladies of my family. 'What on earth is the name of the place near Genoa where Dr N. has his little sanatorium, the one in which so and so was under treatment for so long?' 'Of course you of all people would be the one to forget the name. The place is called *Nervi*.' I must admit I have plenty to do with *nerves*.[3]

(2) Another patient was talking about a neighbouring summer resort, and declared that besides its two well-known inns there was a third one there with which a certain memory of his was connected; he would tell

1 [This analogy was quoted by Freud in Lecture III of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 40–1.]

2 [A year before the publication of this chapter, Freud had already made much use of the Zürich term in a paper on legal proceedings (1906*c*). Some remarks on his adoption of it can be found in an Editors' Note to that paper, ibid., **9**, 79 ff.]

3 ['*Nervi*' means 'nerves' in Latin (and in Italian).]

me the name in a moment. I disputed the existence of this third inn, and [23]
appealed to the fact that I had spent seven summers at the place and must therefore know it better than he did. But under the provocation of my contradiction he had already got hold of the name. The inn was called the 'Hochwartner'. At this point I was obliged to give in and I even had to confess that I had lived for seven whole summers close by the inn whose existence I had denied. Why in this instance should I have forgotten both the name and the thing? I believe it was because the name was only too similar in sound to that of a colleague, a specialist in Vienna, and, once again, had touched upon the 'professional complex' in me.

(3) On another occasion, as I was on the point of booking a ticket at Reichenhall railway station, the name of the next main station would not come into my mind. It was perfectly familiar to me, and I had passed through it very frequently. I had actually to look it up in the timetable. It was '*Rosenheim*'. But I then knew at once owing to what association I had lost it. An hour before, I had paid a visit to my sister at her home close to Reichenhall; as my sister's name is Rosa this was also a '*Rosenheim*' ['Rose-home']. The 'family complex' had robbed me of this name.

(4) I have a whole quantity of examples to illustrate further the positively predatory activities of the 'family complex'.

There came to my consulting room one day a young man who was the younger brother of a woman patient.[1] I had seen him countless times and used to refer to him by his first name. When I wanted to speak about his visit I found I had forgotten his first name (which was, I knew, not at all an unusual one), and nothing could help me to recover it. I thereupon went out into the street to read the names over the shops, and recognized his name the first time I ran across it. The analysis of the episode showed me that I had drawn a parallel between the visitor and my own brother, a parallel which was trying to come to a head in the repressed question: 'Would my brother in the same circumstances have behaved in a similar way, or would he have done the opposite?'[2] The [24]
external link between the thoughts concerned with my own and with the other family was made possible by the chance fact that in both cases the mothers had the same first name of Amalia. Later in retrospect [*nachträglich*] I also understood the substitute names, Daniel and Franz,

1 [In 1901 and 1904 this example was to be found in a footnote to the first sentence of Chapter II. See above, p. 8 *n*. 2. It was transferred to its present place in 1907 when Chapter III was added to the book.]

2 [In 1901 and 1904 only, this sentence ran: 'Would my brother in the same circumstances have behaved in a similar way towards a sister who was ill?']

which had forced themselves on me without making me any wiser. These, like Amalia too, are names from Schiller's [play] *Die Räuber* which were the subject of a jest made by *Daniel* Spitzer, the 'Vienna walker'.[1]

(5) Another time I was unable to recall a patient's name; it belonged to associations from my youth. My analysis followed a very devious path before it provided me with the name I was looking for. The patient had expressed a fear [*Angst*][T] of losing his sight; this awoke the memory of a young man who had been blinded by a gunshot; and this in turn was connected with the figure of yet another youth, who had injured himself by shooting. This last person had the same name as the first patient, though he was not related to him. However, I did not find the name until I had become conscious that an anxious expectation was being transferred [*Übertragung*][T] by me from these two young men who had been injured to a member of my own family.

There thus runs through my thoughts a continuous current of 'personal reference', of which I generally have no inkling, but which betrays itself by such instances of my forgetting names. It is as if I were obliged to compare everything I hear about other people with myself; as if my personal complexes were put on the alert whenever another person is brought to my notice. This cannot possibly be an individual peculiarity
[25] of my own: it must rather contain an indication of the way in which we understand 'something other than ourselves' in general. I have reasons for supposing that other people are in this respect very similar to me.

The neatest instance of this sort was reported to me by a Herr Lederer, who had experienced it himself.[2] While he was on his honeymoon in Venice he came across a gentleman with whom he was superficially acquainted and whom he had to introduce to his young wife. Since, however, he had forgotten the stranger's name, he helped himself out the first time by means of an unintelligible mumble. On meeting the gentleman a second time, as he was bound to do in Venice, he drew him aside and asked him to save him from embarrassment by telling him his name, which he had unfortunately forgotten. The stranger's reply gave evidence of an unusual knowledge of human nature. 'I can readily imagine

1 [Daniel Spitzer (1835–93) was a well-known journalist who made regular contributions to the papers under the title of 'Walks in Vienna'. He is quoted several times in Section 3 of Chapter II of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 29 and 35 f. The reference here is to Spitzer's account of a conversation with a romantic widow, happily under the impression that various characters in Schiller's dramas had been named after members of her family. Cf. Spitzer (1912, 134 ff.).]

2 [In 1901 and 1904 this example was to be found in a footnote to the first sentence of Chapter II. See above, p. 8 *n*. 2. It was transferred to its present position in 1907.]

your failing to remember my name. I have the same name as you – *Lederer*!' – One cannot help having a slightly disagreeable feeling when one comes across one's own name in a stranger. Recently I was very sharply aware of it when a *Herr S. Freud* presented himself to me in my consulting hour. (However, I must record the assurance of one of my critics that in this respect his feelings are the opposite of mine.)[1]

(6) The effects that can be produced by personal reference can also be seen in the following example, reported by Jung (1907, 52):

'A Herr Y. fell in love with a lady; but he met with no success, and shortly afterwards she married a Herr X. Thereafter, Herr Y., in spite of having known Herr X. for a long time and even having business dealings with him, forgot his name over and over again, so that several times he had to enquire what it was from other people when he wanted to correspond with Herr X.'

The motivation of the forgetting is, however, more transparent in this case than in the preceding ones that fall within the constellation of personal reference. Here the forgetting seems a direct consequence of Herr Y.'s antipathy to his more fortunate rival; he wants to know [26] nothing about him: 'never thought of shall he be'.[2]

(7) The motive for forgetting a name may also be a more refined one; it may consist in what might be called a 'sublimated' grudge against the bearer of it. A Fräulein I. von K. writes from Budapest as follows:

'I have propounded a little theory of my own. I have noticed that people who have a talent for painting have no feeling for music, and *vice versa*. Some time ago I had a conversation with someone on this point, in which I remarked: "So far my observation has always held good, with the exception of only one person." When I wanted to recall that person's name, I found it had been irretrievably forgotten, even though I knew that the owner of it was one of my closest friends. When I heard the name mentioned quite by chance a few days later, I knew at once, of course, that it was the destroyer of my theory who was being spoken of. The grudge I unconsciously bore against him was expressed by my forgetting his name, which, apart from that, I knew so well.'

(8)[3] The following case, reported by Ferenczi, shows a somewhat different way in which the personal reference led to a name being forgotten. Its analysis is particularly instructive because of the

1 [This comment was added in 1907.]

2 [From Heine's 'Aus der Matratzengruft' No. IV, *Nachlese*. It is also a traditional Jewish family curse. The last example also appears in Lecture III of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 46 f. The next example was added in 1920.]

3 [This example was added in 1910.]

explanation it gives of the substitute associations (like Botticelli and Boltraffio as substitutes for Signorelli [p. 2 above]).

'A lady, who had heard something about psychoanalysis, could not recall the name of the psychiatrist Jung.[1]

'The following names came to her mind instead: Kl—— (a name), Wilde, Nietzsche, Hauptmann.

'I did not tell her the name and invited her to give free associations to each name in turn.

'Starting from Kl—— she immediately thought of Frau Kl——, and of how she was a prim and affected person, but looked very well for her *age*. "She's *not ageing*." As a common characterization of Wilde and Nietzsche she named "insanity". Then she said chaffingly: "You Freud-
[27] ians will go on looking for the causes of insanity till you're insane yourselves." Then: "I can't bear Wilde and Nietzsche. I don't understand them. I hear they were both homosexuals; Wilde had dealings with *young* people." (In spite of having uttered the correct name – in Hungarian, it is true – in this sentence, she was still unable to recall it.)

'Starting from Hauptmann, first "*Halbe*"[2] and then "*Jugend*" occurred to her; and it was then for the first time, after I had drawn her attention to the word "*Jugend*", that she realized she had been in search of the name *Jung*.

'This lady had lost her husband when she was thirty-nine and had no prospect of marrying again. Thus she had certainly reason enough to avoid recalling anything that reminded her of *youth* or *age*. It is striking that the ideas screening [*Deckeinfälle*] the missing name were associated entirely with its content and that associations with its sound were absent.'

(9)[3] Here is an example of name-forgetting with yet another and a very subtle motivation, which the subject of it has explained himself:

'When I was being examined in philosophy as a subsidiary subject I was questioned by the examiner about the teachings of Epicurus, and after that I was asked if I knew who had taken up his theories in later centuries. I answered with the name of Pierre Gassendi, whom I had heard described as a disciple of Epicurus while I was sitting in a café only a couple of days before. To the surprised question how I knew that, I boldly answered that I had long been interested in Gassendi. The result

1 ['*Jung*' is also the German for 'young'.]

2 [Hauptmann and Halbe were both celebrated German dramatists. One of Halbe's best-known plays was *Jugend* ('Youth').]

3 [This example dates from 1907.]

of this was a certificate *magna cum laude* [with distinction], but also unfortunately a subsequent obstinate tendency to forget the name Gassendi. My guilty conscience is, I think, to blame for my inability to remember the name in spite of all my efforts; for I really ought not to have known it on that occasion either.'

In order to appreciate the intensity of our informant's aversion to recalling this examination episode, the reader would have to know the high value he sets on his doctorate and for how many other things it has to serve as a substitute.

(10)[1] At this point I shall insert another example of the name of a town being forgotten. It is not perhaps as simple as the ones given above [pp. 20 and 21], but it will strike anyone who is fairly well versed in investigations of this nature as authentic and valuable. The name of a town in Italy escaped the subject's memory as a consequence of its great similarity in sound to a woman's first name, with which a number of memories charged with affect were connected, which are doubtless not here reported in full. Sándor Ferenczi of Budapest, who observed this case of forgetting in himself, has treated it in the way in which one analyses a dream or a neurotic idea – a procedure which is fully justified. [28]

'Today I was with a family that I know, and the conversation turned to cities of North Italy. Someone observed that they still showed traces of Austrian influence. A few of these cities were mentioned, and I wanted to give the name of one too, but it escaped me, although I knew I had spent two very pleasant days there – a fact which did not agree very well with Freud's theory of forgetting. In place of the name I was looking for, the following associations forced themselves on me: *Capua*, *Brescia*, *The Lion of Brescia*.

'The picture that I had of this "Lion" took the form of a *marble statue* standing before my eyes like a solid object; I noticed at once, however, that it had less of a resemblance to the lion on the Monument to Freedom at Brescia (of which I have only seen illustrations) than to the other celebrated marble lion which I have seen on the *monument to the dead at Lucerne – the monument to the Swiss guards who fell in the Tuileries*, and of which I have a miniature replica on my bookcase. And now at last the missing name came back to me: it was *Verona*.

'At the same time I knew at once who was to blame for my amnesia. It was no other than a former servant of the family whose guest I was at the time. Her name was *Veronika* (*Verona* in Hungarian), and I had a strong antipathy to her because of her repulsive looks, her *shrill, raucous voice*

1 [This example was added in 1910.]

and her insufferable assertiveness, to which she believed herself entitled by her length of service. At the same time the *tyrannical way* in which she used to treat the children of the house was intolerable to me. I now also understood the meaning of the substitute associations.

[29] 'My immediate association to *Capua* was *caput mortuum* [death's head]. I very often compared Veronika's head to a death's head. The Hungarian word "*kapzsi*" (avaricious) doubtless provided an additional determinant for the displacement. I also, of course, found the much more direct associative paths which connect *Capua* and *Verona* as geographical ideas and as Italian words that have the same rhythm.

'The same is true for *Brescia*; but here too there were winding bypaths in the linkage of ideas.

'My antipathy was at one time so violent that I found Veronika positively nauseating, and I had more than once expressed my astonishment that all the same it was possible for her to have an erotic life and be loved by someone. "Why," I said, "to kiss her would make one feel sick!"[1] Nevertheless, she could certainly long since have been brought into connection with the idea of the *fallen* Swiss Guards.

'*Brescia* is very often mentioned, at any rate here in Hungary, in connection not with the lion but with another *wild animal*. The most hated name in this country, and in the north of Italy too, is that of General *Haynau*, commonly known as the "*Hyena of Brescia*". Thus one thread in my thoughts ran from the hated *tyrant* Haynau via Brescia to the town of Verona, while the other led, via the idea of the *animal with the raucous voice that haunts the graves of the dead* (which helped to determine the emergence in my mind of a *monument to the dead*), to the death's head and to the disagreeable voice of Veronika – the victim of such gross abuse by my unconscious – who in her time had acted almost as tyrannically in this house as had the Austrian general after the Hungarian and Italian struggles for freedom.

'*Lucerne* is connected with the thought of the summer which Veronika spent with her employers *in the neighbourhood of the town of Lucerne*, on the lake of that name. The *Swiss Guard* in turn recalls that she knew how to play the tyrant not only to the children but also to the grown-up members of the family, and fancied herself in the part of a "Garde-Dame [duenna, literally 'guard of ladies']".

[30] 'I must expressly remark that this antipathy of mine towards Veronika is – consciously – something that has long been surmounted. Since those times both her appearance and her manner have changed, greatly

1 [The first half of the German word for 'nausea' ('*Brech*reiz') has a sound similar to the first syllable of 'Brescia'.]

to her advantage, and I can meet her, though I have in fact little occasion for doing so, with genuinely warm feelings. As usual, my unconscious clings more tenaciously to my [earlier] impressions: it is "retrospective" and resentful.[1]

'The *Tuileries* are an allusion to another person, an elderly French lady, who on many occasions actually "guarded" the women of the house; she was respected by everyone, young and old – and no doubt somewhat *feared* as well. For a while I was her *élève* [pupil] for French conversation. The word *élève* further recalls that when I was on a visit to the brother-in-law of my present host, in northern Bohemia, I was very much amused because the local country people called the *élèves* at the school of forestry there by the name of "Löwen"[2] [lions]. This entertaining memory may also have played a part in the displacement from the hyena to the lion.'

(11)[3] The next example, too, shows how a personal complex which is dominating someone at the time may cause a name to be forgotten in some very remote connection.

'Two men, an older and a younger one, who six months before had made a trip together in Sicily, were exchanging recollections of those pleasant and memorable days. "Let's see," said the younger, "what was the name of the place where we spent the night before making our trip to Selinunte? Wasn't it Calatafimi?" The older one rejected it: "No, it certainly wasn't, but I've forgotten the name too, though I recall most clearly all the details of our stay there. I only need to find someone else has forgotten a name, and it at once makes me forget it too. [Cf. below, p. 36 f.] Let's look for the name. But the only thing that occurs to me is Caltanisetta, which certainly isn't right." "No," said the younger man, "the name begins with a 'w' or has a 'w' in it." "But there's no 'w' in [31]
Italian," objected the older. "I really meant a 'v', and I only said 'w' because I'm so used to it in my own language." The older man still opposed the "v". "As a matter of fact," he declared, "I believe I've forgotten a lot of the Sicilian names already; this would be a good time to make some experiments. For example, what was the name of the place on a hill that was called Enna in antiquity? Oh, I know – Castrogiovanni." The next moment the younger man had recalled the lost name as well.

1 [In German: "'*nachträglich*" und *nachtragend*'. See *RSE*, **24**, 77–9.]

2 [The dialect pronunciation of the first syllable of this word would resemble that of the second syllable of 'élèves'.]

3 [This example was added in 1912. It had previously appeared as a separate paper under the title 'A Contribution to the Forgetting of Proper Names' in June, 1911. (Freud, 1911*i*.) The episode is autobiographical, and relates to Freud's visit to Sicily in the autumn of 1910 in the company of Ferenczi.]

"Castelvetrano," he exclaimed, and was pleased at being able to point to the "v" he had insisted on. For a short while the older one had no sense of recognition; but after he had accepted the name it was for him to explain why he had forgotten it. "Obviously," he said, "because the second half, '-vetrano', sounds like 'veteran'. I know I don't much like to think about *growing old*, and I have strange reactions when I'm reminded of it. For instance, I recently charged a very dear friend of mine in the strangest terms with having 'left his youth far behind him', for the reason that once before, in the middle of the most flattering remarks about me, he had added that I was 'no longer a young man'.[1] Another sign that my resistance was directed against the second half of the name Castelvetrano is that the initial sound recurred in the substitute name Caltanisetta." "What about the name Caltanisetta itself?" asked the younger man. "That," confessed the older one, "has always seemed to me like a pet name for a young woman."

'Some time later he added: "Of course the name for Enna was also a substitute name. And it occurs to me now that Castrogiovanni – a name that forced its way to the front with the help of a rationalization – sounds like '*giovane*' (young) in exactly the same way as the lost name Castelvetrano sounds like '*veteran*' (old)."

'The older man believed that in this way he had accounted for his
[32] forgetting the name. No investigation was made of the motive for the similar failure of the younger man's memory.'

Not only the motives, but also the mechanism governing the forgetting of names, deserve our interest.[2] In a large number of cases a name is forgotten not because the name itself arouses such motives, but because – owing to similarity in sound and to assonance – it touches upon *another* name against which these motives do operate. If the determinants are relaxed in this way, the occurrence of the phenomenon will obviously be made very much easier, as the following examples show.

(12) Reported by Dr Eduard Hitschmann (1913*a*): 'Herr N. wanted to give someone the name of the firm of [Vienna] booksellers Gilhofer and Ranschburg. But however much he thought over it, only the name Ranschburg occurred to him, though he knew the firm perfectly well.

1 [The friend was J. J. Putnam, and Freud's remark occurs in a footnote to a translation which he made of a paper of Putnam's (1910). This footnote (Freud, 1911*j*) is given in full in *RSE*, **17**, 263–4. The phrase quoted from Putnam can be found in another paper of his (1909). The whole episode is discussed in Jones, 1955, 82–3.]

2 [This paragraph and the examples from 12 to 17 inclusive (i.e. down to p. 34) were added in 1917.]

He returned home feeling somewhat dissatisfied, and thought it sufficiently important to ask his brother (who was apparently already asleep) what the first half of the firm's name was. His brother gave him the name without hesitation. Thereupon the word "Gallhof" immediately sprang to Herr N.'s mind as an association to "Gilhofer". Gallhof was the place where a few months before he had gone for a memorable walk with an attractive young lady. As a memento the lady had given him a present which was inscribed "A souvenir of the happy hours at Gallhof ['*Gallhofer Stunden*', literally 'Gallhof hours']". In the course of the days just before the name was forgotten, this present had been badly damaged, seemingly by accident, through N.'s shutting a drawer too hastily. He noticed this with a certain sense of guilt, for he was familiar with the meaning of symptomatic acts. [See Chapter IX.] At the time his feelings towards the lady were somewhat ambivalent: he certainly loved her, but he felt hesitation in the face of her desire that they should get married.'

(13) Reported by Dr Hanns Sachs: 'In a conversation about Genoa and its immediate surroundings, a young man wanted to mention the place called *Pegli*, but could only recall the name with an effort after racking his brains. On the way home he thought of the distressing manner in [33] which so familiar a name had slipped away, and in doing so was led to a word sounding very similar: *Peli*. He knew that there was a South Sea island of that name, whose inhabitants still retained a few remarkable customs. He had read about them recently in an ethnological work and had at the time made up his mind to use the information in support of a hypothesis of his own. It then occurred to him that Peli was also the setting of a novel which he had read with interest and enjoyment – namely *Van Zantens glücklichste Zeit* [*Van Zanten's Happiest Time*] by Laurids Bruun. The thoughts that had occupied his mind almost incessantly during the day centred round a letter he had received that same morning from a lady he was very fond of. This letter gave him reason to fear that he would have to forgo a meeting that had been arranged. After being in a very bad mood all day, he had gone out in the evening resolved not to plague himself any longer with the tiresome thought but to enjoy the social occasion in front of him, on which he in fact set an extremely high value, in as serene a mood as possible. It is clear that his resolution could have been gravely imperilled by the word *Pegli*, as its connection in sound with *Peli* was so close; and Peli in turn, having acquired a personal connection with himself by its ethnological interest, embodied not only Van Zanten's but also his own "happiest time", and therefore the

fears and anxieties as well which he had nursed all day long. It is characteristic that this simple explanation became clear only after a second letter from his friend had transformed his doubt into the happy certainty of seeing her again soon.'

This example may recall what might be described as its geographical neighbour, in which the name of the town of Nervi could not be remembered (Example 1 [p. 20 above]). Thus we see how a pair of words that are similar in sound can have the same effect as a single word that has two meanings.

(14) When war broke out with Italy in 1915 I was able to make the observation upon myself that a whole quantity of Italian place names which at ordinary times were readily available to me had suddenly been withdrawn from my memory. Like so many other Germans I had made it my habit to spend a part of my holidays on Italian soil, and I could not doubt
[34] that this large-scale forgetting of names was the expression of an understandable hostility to Italy which had now replaced my former partiality. In addition to this directly motivated forgetting of names, however, an indirect amnesia could also be detected, which it was possible to trace back to the same influence. I showed a tendency to forget non-Italian place names as well; and on investigating the incidents I found that these names were in some way connected by means of remote similarities of sound with the proscribed enemy names. Thus I tormented myself one day in trying to recall the name of the Moravian town of Bisenz. When it finally came to my mind I at once recognized that this act of forgetting was to be laid to the charge of the Palazzo Bisenzi at Orvieto. The Hotel Belle Arti, where I had stayed on all my visits to Orvieto, is located in this palazzo.[1] The most precious memories had naturally been the most severely damaged by the change in my emotional attitude.

Some examples may also help to remind us of the variety of purposes that can be served by the parapraxis of name-forgetting.

(15) Reported by A. J. Storfer (1914*a*): 'One morning a lady who lived in Basle received news that a friend of her youth, Selma X. of Berlin, who was just then on her honeymoon, was passing through Basle, but staying only one day. The Basle lady hurried straight away to her hotel. When the friends separated, they made an arrangement to meet again in the afternoon and to be with each other up to the time of the Berlin lady's departure.

'In the afternoon the Basle lady *forgot* about the rendezvous. I do not know what determined her forgetting it, yet in this particular situation

1 [The present example is briefly reported by Freud in Lecture IV of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 65 f.]

(a meeting with a *schoolfriend who has just married*) various typical constellations are possible which could determine an inhibition against the repetition of the meeting. The point of interest in this case lies in a *further* parapraxis, which represents an unconscious safeguarding of the first one. At the time when she was to have met her friend from Berlin the Basle lady happened to be in company at another place. The recent marriage of the Viennese opera singer Kurz[1] came up in conversation; the [35]
Basle lady gave vent to some critical remarks (!) about this marriage, but when she wanted to mention the singer by name, she found to her very great embarrassment that she could not think of her first name. (There is, as is well known, a particular tendency to give the first name also, precisely in cases where the surname is a monosyllable.) The Basle lady was all the more put out by her lapse of memory since she had often heard Kurz sing and ordinarily knew her (whole) name perfectly well. Before anyone had mentioned the missing first name the conversation took another direction.

'In the evening of the same day our Basle lady was among a number of people, some of whom were the same as those she had been with in the afternoon. By a coincidence the conversation again turned to the marriage of the Viennese singer; and without any difficulty the lady produced the name "*Selma* Kurz". "Oh dear!" she at once exclaimed, "it's just struck me – I've completely forgotten I had an appointment with my friend Selma this afternoon." A glance at the clock showed that her friend must have left already.'

We are perhaps not ready yet to appreciate all the aspects of this pretty example. The following is a simpler specimen, though here it was not a name but a foreign word that was forgotten, from a motive arising out of the situation. (We can already see that we are dealing with the same processes, whether they apply to proper names, first names, foreign words or sets of words.) Here it was a case of a young man forgetting the English word for '*Gold*' – which is identical to the German word – so as to find an opportunity for carrying out an action he desired.

(16) Reported by Dr Hanns Sachs: 'A young man became acquainted in a pension with an English lady, whom he took a liking to. On the first evening of their acquaintance he was having a conversation with her in her native language, which he knew fairly well; and in the course of it he wanted to use the English word for "*Gold*". In spite of strenuous efforts the word would not come to him. Instead, the French *or*, the Latin *aurum* and the Greek *chrysos* obstinately forced themselves on him as substitutes, so that it needed quite an effort to reject them, though he

1 [The celebrated coloratura soprano.]

[36] knew for certain that they were not related at all to the word he was looking for. In the end the only way he could find of making himself understood was by touching a gold ring on the lady's hand; and he was very much abashed on learning from her that the long-lost word for gold was exactly the same as the German one, namely "gold". The great value of this touching, for which the forgetting gave an opportunity, did not lie merely in the unobjectionable satisfaction of the drive to grasp or
Trieb touch [*Ergreifungs- oder Berührungstriebes*][T] – for there are other opportunities for this which are eagerly exploited by lovers. It lay much more in the way in which it assisted in clarifying the prospects of the courtship. The lady's unconscious would divine the erotic aim of the forgetting, hidden by its mask of innocence, especially if her unconscious was sympathetically drawn to the man she was talking with. The manner in which she treated his touching of her and accepted its motivation could in this way become a means – unconscious for both of them, yet full of significance – of reaching an understanding on the chances of the flirtation just begun.'

(17) From J. Stärcke (1916) I report another interesting observation that concerns the forgetting and subsequent recovery of a proper name. This case is distinguished by the fact that the forgetting of the name was connected with the misquoting of a set of words from a poem, as in the example of the 'Bride of Corinth' [p. 14 above].

'Z., an old jurist and philologist, was describing in company how in his student days in Germany he had known a quite exceptionally stupid student, and had some anecdotes to tell of his stupidity. He could not, however, recall the student's name; he believed it began with a "W", but later took back the idea. He recalled that the stupid student later became a *wine merchant*. He then told another anecdote about the student's stupidity, and once again expressed surprise that his name did not come back to him. "He was such an ass," he then remarked, "that I still don't understand how I succeeded in drumming Latin into his head." A moment later he remembered that the name he was looking for ended in ". . . *man*". At this point we asked him if any other name ending in "man" occurred to him, and he gave "*Erdmann* [earthman]". "Who is that?" "That was another student of those days." His daughter, however,
[37] observed that there was also a Professor Erdmann. Some closer questioning revealed that this Professor Erdmann, who was the editor of a periodical, had recently refused to accept a piece of work submitted by Z., with which he partly disagreed, except in a shortened form; and Z. had been considerably put out. (In addition, I later discovered that, years

before, Z. had very probably expected to become professor in the same department in which Professor Erdmann now lectured. This, then, may have been another reason why the name touched on a sensitive spot.)

'At this point the stupid student's name suddenly came back to him: "Lindeman". Since he had already recalled that the name ended in "man", it was "*Linde* [linden, lime-tree]" that had remained repressed for longer. When he was asked what came to his mind when he thought of "*Linde*", he at first said: "Absolutely nothing." When I urged that something connected with this word would no doubt occur to him, he remarked with an upward gaze and a gesture of his hand in the air: "A linden – well, a linden is a beautiful tree." Nothing further would come to his mind. No-one spoke and everyone went on with their reading or other activity, till a few moments later Z. quoted the following passage in a dreamy voice:

Steht er mit festen
Gefügigen Knochen
Auf der *Erde*,
So reicht er nicht auf,
Nur mit der *Linde*
Oder der *Rebe*
Sich zu vergleichen.[1]

'I gave a cry of triumph. "There's our Erdmann [earthman]," I said. "The man who 'stands on the earth', that is to say the earthman or Erdmann, cannot reach up far enough to bear comparison with the linden (Lindeman) or the vine (wine merchant). In other words, our Lindeman, the stupid student, who later became a wine merchant, was certainly an ass, but our Erdmann is a much greater ass than that, and cannot even be compared with this Lindeman." – Such derisive or abusive language in the unconscious is quite usual; so it seemed to me that the chief cause of the name being forgotten had probably now been found. [38]

'I now asked what the poem was from which the lines were quoted. Z. said it was a poem by Goethe, which he thought began:

Edel sei der Mensch,
Hilfreich und gut![2]

1 [Literally 'If he stands with firm, pliant bones on the *earth*, he does not reach up far enough to bear comparison even with the *linden* or the *vine*.']

2 ['Let Man be noble, helpful and good.']

and which later contained the lines:

> Und hebt er sich aufwärts,
> So spielen mit ihm die Winde.[1]

'The next day I looked up this poem of Goethe's, and it turned out that the case was even prettier (though also more complex) than it had seemed at first.

(*a*) 'The first lines that he quoted run (cf. above):

> Steht er mit festen
> *Markigen* Knochen . . .[2]

"'*Gefügige* Knochen [*pliant* bones]" would be a rather peculiar combination; but I shall not go further into this point.

(*b*) 'The next lines of this stanza run (cf. above):

> . . . Auf der *wohlgegründeten*
> *Dauernden* Erde,
> Reicht er nicht auf,
> Nur mit der *Eiche*
> Oder der Rebe
> Sich zu vergleichen.[3]

'So in the whole poem there is no mention of a linden. The change of "oak" into "linden" had taken place (in his unconscious) only in order to make the play on the words "earth – linden – vine" possible.

(*c*) 'This poem is called "Grenzen der Menschheit [The Limits of Mankind]" and compares the omnipotence of the gods with man's puny strength. But the poem beginning:

> Edel sei der Mensch,
> Hilfreich und gut!

[39] is a different one, appearing some pages further on. Its title is "Das Göttliche [The Divine Nature]", and it too contains thoughts about gods and men. As the matter was not gone into further I can at the most offer an opinion that thoughts about life and death, the temporal and the eternal, and the subject's own frail life and future death also played a part in bringing about the occurrence of this case.'

1 ['And if he raises himself upwards the winds play with him.']

2 ['If he stands with firm, *sturdy* bones . . .']

3 ['. . . on the *firmly based, enduring* earth, he does not reach up far enough to bear comparison even with the *oak* or the vine.']

In some of these examples all the subtleties of psychoanalytic technique have to be called upon in order to explain the forgetting of a name. Anyone who wishes to learn more about such work may be referred to a paper by Ernest Jones of London (1911*a*). It has been translated into German.[1]

(18) Ferenczi has observed that forgetting a name may also make its appearance as a hysterical symptom. In this situation it displays a very different mechanism from that of a parapraxis. The nature of this distinction may be seen from what he says:

'At the moment I am treating a patient, a spinster getting on in years, in whose mind the most familiar and best-known proper names fail to appear, although her memory is otherwise good. In the course of the analysis it has become clear that this symptom is intended by her as a documentation of her ignorance. This demonstrative parade of her ignorance is, however, really a reproach against her parents, who did not let her have any higher education. Her tormenting obsession to clean things ("housewife's psychosis") also comes in part from the same source. What she means by this is something like: "You have turned me into a housemaid."'

I could cite[2] further instances of the forgetting of names and explore the matter much more fully if I were not reluctant to anticipate at this first stage almost all the points of view that will come up for discussion under later topics. But I may perhaps allow myself to summarize in a few sentences the conclusions to be drawn from the analyses that have been reported here:

The mechanism of names being forgotten (or, to be more accurate, the mechanism of names escaping the memory, of being *temporarily* forgotten) consists in the interference with the intended reproduction of the name by an alien train of thought which is not at the time conscious. Between the name interfered with and the interfering complex either a connection exists from the outset, or else such a connection has established itself, often in ways that appear artificial, via superficial (external) associations. [40]

Among the interfering complexes those of personal reference (i.e. the personal, family and professional complexes) prove to have the greatest effect.

A name which has more than one meaning and consequently belongs to more than one group of thoughts (complexes) is frequently interfered

1 [This paragraph was added in 1912. The following example (18) was added in 1920.]

2 [What follows to the middle of the next page dates back to 1907.]

with in its connection with one train of thought owing to its participation in another, stronger complex.

Among the motives for these interferences the purpose of avoiding arousing unpleasure by remembering is conspicuous.

In general two main types of name-forgetting may be distinguished: those cases where the name itself touches on something unpleasant, and those where it is brought into connection with another name which has that effect. Thus names can have their reproduction interfered with on their own account, or because of their closer or remoter associative relations.

A survey of these general propositions shows us why the temporary forgetting of names is the most frequently to be observed of all our parapraxes.

(19) We are however far from having outlined all the characteristics of this phenomenon. There is a further point I wish to make. The forgetting of names is highly contagious. In a conversation between two people it is often sufficient for one of them merely to mention that he has forgotten such and such a name, and the result will be that it slips the other's mind as well. In cases like these, however, where the forgetting is induced, the forgotten name returns more readily.[1] – This 'collective' forgetting, strictly speaking a phenomenon of group psychology, has not yet been made the subject of psychoanalytic study. In a single instance
[41] (but an especially neat one) Reik (1920*a*) has been able to offer a good explanation of this curious phenomenon.

'In a small gathering of university people, which included two women students of philosophy, there was a discussion on the numerous questions raised in the fields of religious studies and the history of civilization by the origin of Christianity. One of the young ladies who took part in the conversation recalled that in an English novel she had read recently she had found an interesting picture of the many religious currents by which that age had been stirred. She added that the novel portrayed the whole of Christ's life from his birth up to his death; but the name of the work refused to come to her mind. (The visual memory she had of the cover of the book and the appearance of the lettering in the title was ultra-clear [cf. footnote 3, pp. 11–12 above].) Three of the men who were present also said that they knew the novel, and they remarked that – strange to relate – they too were unable to produce the name.'

1 [Cf. pp. 27 f. above and 54 below. – The rest of the chapter, with the exception of the last paragraph, was added in 1920.]

The young lady was the only one to subject herself to analysis in order to discover why this name was forgotten. The title of the book was *Ben Hur*, by Lewis Wallace. The ideas that had occurred to her as substitutes for it had been: '*Ecce homo*' – '*Homo sum*' – '*Quo vadis?*' The girl herself realized that she had forgotten the name 'because it contains an expression that I (like any other girl) do not care to use – especially in the company of young men'.[1] In the light of the very interesting analysis, this explanation took on a profounder significance. In the context already alluded to, the translation of '*homo*' (man) also has a disreputable meaning. Reik's conclusion is as follows: 'The young lady treated the word as though by uttering the questionable title in front of young men she would have been acknowledging the wishes which she had rejected as out of keeping with her character and distressing to her. More briefly: saying the words "Ben Hur"[2] was unconsciously equated by her with a sexual offer, and her forgetting accordingly corresponded to the fending off of an unconscious temptation of that kind. We have reason for supposing that similarly unconscious processes had determined the young men's forgetting. Their unconscious understood the real [42] significance of the girl's forgetting and, so to speak, interpreted it. The men's forgetting shows respect for this modest behaviour. . . . It is as if the girl who was talking with them had by her sudden lapse of memory given a clear sign, which the men had unconsciously understood well enough.'

A type of continued forgetting of names occurs also, in which whole chains of names are withdrawn from the memory.[3] If in the attempt to recover a lost name other names closely connected with it are pursued, it frequently happens that these new names, which were to serve as stepping-stones to the other one, disappear in just the same way. The forgetting thus jumps from one name to another, as if to prove the existence of an obstacle which cannot easily be surmounted.

1 ['*Hure*' is the German for 'whore'.]

2 [The German words '*bin Hure*' ('I am a whore') sound not unlike 'Ben Hur'.]

3 [This paragraph dates from 1907.]

IV
CHILDHOOD MEMORIES AND SCREEN MEMORIES[1]

[43] In a second paper, which was published in the *Monatsschrift für Psychiatrie und Neurologie* (1899*a*), I was in a position to demonstrate at an unexpected point the tendentious nature of the workings of our memory. I started from the striking fact that a person's earliest childhood memories seem frequently to have preserved what is indifferent and unimportant, whereas (frequently, though certainly not universally) no trace is found in an adult's memory of impressions dating from that time which are important, impressive and rich in affect. It might be assumed from this – since it is known that the memory makes a selection from among the impressions offered to it – that in childhood the selection is conducted on entirely different principles from those which apply at the time of intellectual maturity. Careful investigation nevertheless shows that such an assumption is unnecessary. The indifferent memories of childhood owe their existence to a process of displacement [*Verschiebungsvorgang*]: they are substitutes, in [mnemic] reproduction, for other impressions which are really significant. The memory of these significant impressions can be developed out of the indifferent ones by means of psychical analysis, but a resistance [*Widerstand*] prevents them from being directly reproduced. As the indifferent memories owe their preservation not to their own content but to an associative relation between their content and another which is repressed [*verdrängten*], they have some claim to be called 'screen memories', the name by which I have described them.

In the paper which I have mentioned I only touched on and in no way exhausted the multiplicity of the relations and meanings of screen
[44] memories. In the example quoted there, of which I gave a detailed analysis,[2] I laid special stress on a peculiarity of the *chronological*

1 [In 1901 and 1904 the title of this chapter was simply 'Screen Memories' ['*Deckerinnerungen*'] and it consisted of the first four paragraphs only. The whole of the remainder was added in 1907, except for one paragraph (on p. 43 below) which dates from 1920, and the final footnote.]

2 [This example, like the one at the end of the present chapter, was in fact derived from Freud's own experience. See the Editors' Note to the paper in question (*RSE*, **3**, 293 f.).]

relation between the screen memory and the content which is screened off [*gedeckten*] by it. In that example the content of the screen memory belonged to one of the earliest years of childhood, while the mental experiences which were replaced by it in the memory and which had remained almost unconscious occurred in the subject's later life. I described this sort of displacement as a *retroactive* or *retrogressive* one. The opposite relation is found perhaps still more frequently: an indifferent impression of recent date establishes itself in the memory as a screen memory, although it owes that privilege merely to its connection with an earlier experience which resistances prevent from being reproduced directly. These would be screen memories that have *pushed ahead* or been *displaced forward*.[1] Here the essential thing with which the memory is occupied *precedes* the screen memory in time. Finally, we find yet a third possibility, in which the screen memory is connected with the impression that it screens not only by its content but also by contiguity in time: these are *contemporary* or *contiguous* screen memories.

How large a part of our store of memory falls into the category of screen memories, and what role they play in various neurotic thought processes, are problems whose significance I neither discussed in my earlier paper nor shall enter into here. My only concern is to emphasize the similarity between the forgetting of proper names accompanied by paramnesia, and the formation of screen memories.

At first sight the differences between the two phenomena are much more striking than any analogies that may be found. The former phenomenon relates to proper names; the latter to whole impressions, things experienced either in reality or in thought. In the former we have a manifest failure of the function of memory; in the latter, an act of memory that strikes us as strange. In the former it is a case of momentary disturbance – for the name that has just been forgotten may have been produced correctly a hundred times before, and from [45] tomorrow may be produced once again; in the latter it is a case of a permanent and constant memory, since the indifferent childhood memories seem to have the power of staying with us through a large part of our life. The problem in these two cases appears to be quite differently focused. In the former it is the forgetting, in the latter the retention which arouses our scientific curiosity. Closer study reveals that in spite of the dissimilarity between the two phenomena in regard to their psychical material and their duration, the points at which they agree far outbalance it. Both have to do with mistakes in remembering: what the

1 [I.e. the *displacement* in their case would have been in a forward direction.]

memory reproduces is not what it should correctly have reproduced, but something else as a substitute. In the case of the forgetting of names the act of memory occurs, though in the form of substitute names; the case of the formation of screen memories has as its basis a forgetting of other more important impressions. In both instances an intellectual feeling gives us information of interference by some disturbing factor; but it takes two different forms. With the forgetting of names we *know* that the substitute names are *false*: with screen memories we are *surprised* that we possess them at all. If, now, psychological analysis establishes that the substitutive formation has come about in the same way in both cases, by means of displacement along a superficial association, it is precisely the dissimilarities between the two phenomena, in regard to their material, their duration and their focal point, which serve to heighten our expectation that we have discovered something of importance and of general validity. This general principle would assert that when the reproducing function fails or goes astray, the occurrence points, far more frequently than we suspect, to interference by a tendentious factor – that is, by a *purpose* which favours one memory while striving to work against another.[1]

The subject of childhood memories seems to me to be of such significance and interest that I should like to devote to it a few additional observations which go beyond the views that I have so far expressed.

[46] How far back into childhood do our memories extend? I am familiar with a few investigations into this question, such as those by V. & C. Henri (1897) and by Potwin (1901). They show that great individual differences exist among the persons examined: a few assign their earliest memories to the sixth month of life, while others remember nothing of their lives up to the end of their sixth or even eighth year. But with what are these differences in retaining childhood memories connected, and what significance attaches to them? Clearly it is not sufficient to assemble the material for answering these points by means of a questionnaire; what is required in addition is that it should be worked over – a process in which the person supplying the information must participate.

In my opinion we take the fact of infantile amnesia – the loss, that is, of the memories of the first years of our life – much too easily; and we fail to look upon it as a strange riddle. We forget how high are the intellectual achievements and how complicated the emotional impulses

1 [In the 1901 and 1904 editions the chapter ended at this point. See footnote 1, p. 38 above.]

of which a child of some four years is capable, and we ought to be positively astonished that the memory of later years has as a rule preserved so little of these mental processes, especially as we have every reason to suppose that these same forgotten childhood achievements have not, as might be thought, slipped away without leaving their mark on the subject's development, but have exercised a determining influence for the whole of his later life. And in spite of this unique efficacy they have been forgotten! This suggests that there are conditions for remembering (in the sense of conscious reproducing) of a quite special kind, which have evaded recognition by us up to now. It may very well be that the forgetting of childhood can supply us with the key to the understanding of those amnesias which lie, according to our more recent discoveries, at the basis of the formation of all neurotic symptoms.[1]

Of the childhood memories that have been retained a few strike us as perfectly understandable, while others seem odd or unintelligible. It is not difficult to correct certain errors regarding both sorts. If the memories that a person has retained are subjected to an analytic enquiry, it is easy to establish that there is no guarantee of their accuracy. Some of the [47]
mnemic images are certainly falsified, incomplete or displaced in time and place. Any such statement by the subjects of the enquiry as that their first recollection comes from about their second year is clearly not to be trusted. Moreover, motives can soon be discovered which make the distortion and displacement of the experience intelligible, but which show at the same time that these mistakes in recollection cannot be caused simply by a treacherous memory. Strong forces from later life have been at work on the capacity of childhood experiences for being remembered – probably the same forces which are responsible for our having become so far removed in general from understanding our years of childhood.

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest [visual] outlines of what they have experienced. Following Charcot's proposal, such people are called *auditifs* and *moteurs* in contrast to the *visuels*. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development[2] is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of

1 [Freud had asserted a connection between infantile amnesia and the psychoneuroses in a letter to Fliess of March 10, 1898 (Freud, 1950*a*, Letter 84). He had discussed the question more fully in the second of his *Three Essays* (1905*d*), *RSE*, 7, 155–6.]

2 [I.e. the development of the distinctions proposed by Charcot.]

memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult *visuels* no longer see themselves.[1] Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood
[48] memories we possess not the genuine memory trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.[2]

Anyone who has investigated a number of people psychologically by the method of psychoanalysis will in the course of his work have collected numerous examples of every kind of screen memory. However, the reporting of these examples is made extraordinarily difficult owing to the nature of the relations, which I have just discussed, between childhood memories and later life. In order to show that a childhood memory is to be regarded as a screen memory, it would often be necessary to present the complete life history of the person in question. Only rarely is it possible to lift a single screen memory out of its context in order to give an account of it, as in the following good example.

A man of twenty-four has preserved the following picture from his fifth year. He is sitting in the garden of a summer villa, on a small chair beside his aunt, who is trying to teach him the letters of the alphabet. He is in difficulties over the difference between *m* and *n* and he asks his aunt to tell him how to know one from the other. His aunt points out to him that the *m* has a whole piece more than the *n* – the third stroke. There appeared to be no reason for challenging the trustworthiness of this childhood memory; it had, however, only acquired its meaning at a later date, when it showed itself suited to represent symbolically another of

1 This statement is based on a number of enquiries I have made.

2 [This analogy between the childhood memories of an individual and the myths and legends of a nation relating to its prehistoric past is developed by Freud in Chapter II of his essay on Leonardo da Vinci (1910*c*), *RSE*, **11**, 78–9. See also below, p. 128.]

the boy's curiosities. For just as at that time he wanted to know the difference between *m* and *n*, so later he was anxious to find out the difference between boys and girls, and would have been very willing for this particular aunt to be the one to teach him. He also discovered then that the difference was a similar one – that a boy, too, has a whole piece more than a girl; and at the time when he acquired this piece of knowledge he [49] called up the recollection of the parallel curiosity of his childhood.

Here is another example, from the later years of childhood.[1] A man who is severely inhibited in his erotic life, and who is now over forty, is the eldest of nine children. At the time that the youngest of his brothers and sisters was born he was fifteen, yet he maintains firmly and obstinately that he had never noticed any of his mother's pregnancies. Under pressure from my scepticism a memory presented itself to him: once at the age of eleven or twelve he had seen his mother hurriedly *unfasten* her skirt in front of the mirror. He now added of his own accord that she had come in from the street and had been overcome by unexpected labour pains. The unfastening [*Aufbinden*] of the skirt was a screen memory for the confinement [*Entbindung*]. We shall come across the use of 'verbal bridges' of this kind in further cases.[2]

I should like now to give a single example of the way in which a childhood memory, which previously appeared to have no meaning, can acquire one as a result of being worked over by analysis. When I began in my forty-third year to direct my interest to what was left of my memory of my own childhood there came to my mind a scene which had for a long while back (from the remotest past, as it seemed to me) come into consciousness from time to time, and which I had good evidence for assigning to a date before the end of my third year.[3] I saw myself standing [50]

1 [This paragraph was added in 1920.]

2 [See below, pp. 95 and 235. – In Freud's interleaved copy of the 1904 edition (cf. Editors' Introduction, p. xvi above) the following notes on screen memories are to be found. 'Dr B—— showed very neatly one Wednesday [i.e. at a meeting of the Vienna Psychoanalytical Society (cf. Jones, 1955, 9)] that fairy tales can be made use of as screen memories in the same kind of way that empty shells are used as a home by the hermit crab. These fairy tales then become favourites, without the reason being known.' – 'From a dream of P.'s it appears that ice is in fact a symbol by antithesis for an erection: i.e. something that becomes hard in the cold instead of – like a penis – in heat (in excitation). The two antithetical concepts of sexuality and death are frequently linked through the idea that death makes things stiff. One of the Henris' informants instanced a piece of ice as a screen memory for his grandmother's death. See my paper on "Screen Memories" [1899*a*; *RSE*, **3**, where the paper by V. & C. Henri (1897) is more fully discussed].']

3 [The important part played by this screen memory in Freud's self-analysis, and the progressive stages in its elucidation, can be followed in two letters which he wrote to Fliess on October 3–4 and October 15, 1897 (Freud, 1950*a*, Letters 70 and 71). At that date Freud was, in fact, in his forty-*second* year. The nurse who figures prominently in the story is also referred to in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 220.]

in front of a cupboard ['*Kasten*'] demanding something and screaming, while my half-brother, my senior by twenty years, held it open. Then suddenly my mother, looking beautiful and slim, walked into the room, as if she had come in from the street. These were the words in which I described the scene, of which I had a plastic picture, but I did not know what more I could make of it. Whether my brother wanted to open or shut the cupboard – in my first translation of the picture I called it a 'wardrobe' ['*Schrank*'] – why I was crying, and what the arrival of my mother had to do with it – all this was obscure to me. The explanation I was tempted to give myself was that what was in question was a memory of being teased by my elder brother and of my mother putting a stop to it. Such misunderstandings of a childhood scene which is preserved in the memory are by no means rare: a situation is recalled, but it is not clear what its central point is, and one does not know on which of its elements the psychical accent is to be placed. Analytic effort led me to take a quite unexpected view [*Auffassung*][T] of the picture. I had missed my mother, and had come to suspect that she was shut up in this wardrobe or cupboard; and it was for that reason that I was demanding that my brother should open the cupboard. When he did what I asked and I had made certain that my mother was not in the cupboard, I began to scream. This is the moment that my memory has held fast; and it was followed at once by the appearance of my mother, which allayed my anxiety or longing. But how did the child get the idea of looking for his absent mother in the cupboard? Dreams which I had at the same time [as the analysis of this memory] contained obscure allusions to a nurse of whom I had other recollections, such as, for example, that she used to insist on my dutifully handing over to her the small coins I received as presents – a detail which can itself claim to have the value of a screen memory for later experiences.[1] I accordingly resolved that this time I
[51] would make the problem of interpretation easier for myself and would ask my mother, who was by then grown old, about the nurse. I learnt a variety of details, among them that this clever but dishonest person had carried out considerable thefts in the house during my mother's confinement and had been taken to court on a charge preferred by my half-brother. This information threw a flood of light on the childhood scene, and so enabled me to understand it. The sudden disappearance of the nurse had not been a matter of indifference to me: the reason why I had turned in particular to this brother, and had asked him where she

1 [More details about this can be found in the two letters to Fliess referred to in footnote 3, p. 43 above.]

was, was probably because I had noticed that he played a part in her disappearance; and he had answered in the elusive and punning fashion that was[1] characteristic of him: 'She's "boxed up" ["*eingekastelt*"].' At the time, I understood this answer in a child's way [i.e. literally], but I stopped asking any more questions as there was nothing more to learn. When my mother left me a short while later, I suspected that my naughty brother had done the same thing to her that he had done to the nurse and I forced him to open the cupboard ['*Kasten*'] for me. I now understand, too, why in the translation of this visual childhood scene my mother's slimness was emphasized: it must have struck me as having just been restored to her. I am two and a half years older than the sister who was born at that time, and when I was three years old my half-brother and I ceased living in the same place.[2]

1 [In the editions of 1907, 1910 and 1912: 'that is even today'.]

2 [*Footnote added* 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him – namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the *deeper* trend of thought, the affect was in the [52] wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer. – [Freud returned repeatedly to the subject of childhood memories. In his study on Leonardo da Vinci (1910*c*), *RSE*, **11**, 61 ff., and his paper on a memory of Goethe's (1917*b*), ibid., **17**, 139 ff., he applied his clinical observations to historical characters. – Some discussion of the processes of 'normal' forgetting can be found on pp. 117–18 and in footnote 3, pp. 235–6 below.]

V

SLIPS OF THE TONGUE[1]

[53] The common [linguistic] material which we use for talking in our native language appears to be protected against being forgotten; but it succumbs all the more frequently to another disturbance, which is known as a 'slip of the tongue'. The slips of the tongue that we observe in normal people give an impression of being the preliminary stages of the so-called 'paraphasias' that appear under pathological conditions.[2]

This is a subject on which I find myself in the exceptional position of being able to acknowledge the value of a previous work. In 1895 Meringer & C. Mayer published a study on 'Slips in Speaking and Reading'. Their lines of approach differ widely from my own. One of the authors, who acts as spokesman in the text, is in fact a philologist, and it was his linguistic interests which led him to attempt to discover the rules that govern the making of slips of the tongue. He hoped to be able to conclude from these rules that there exists 'a certain mental mechanism, in which the sounds of a word, or of a sentence, and the [whole] words as well, are mutually linked and connected in a quite peculiar way' (10).[3]

The examples of slips of the tongue collected by the authors are first grouped by them in purely descriptive categories. They are classed as *transpositions* (e.g. 'the Milo of Venus' instead of 'the Venus of Milo');
[54] *pre-sonances* or *anticipations* (e.g. 'es war mir auf der Schwest . . . auf der Brust so schwer'[4]); *post-sonances* or *perseverations* (e.g. 'ich fordere Sie *auf*, *auf* das Wohl unseres Chefs *auf*zustossen' instead of

1 [*Das Versprechen*.[T] With the exception of two paragraphs on p. 48, and Example 8 on p. 55 f. below, the whole of the earlier portion of this chapter (up to p. 58) dates back to 1901.]

2 [Freud had discussed 'paraphasia' as a symptom of organic brain disorders in his book on aphasia (1891*b*, 13 ff.; *NSW*, **4**); but he had also pointed out there that the *symptom* of paraphasia in such disorders 'does not differ from the incorrect use and the distortion of words which the healthy person can observe in himself in states of fatigue or divided attention or under the influence of disturbing affects'.]

3 [Page references in this chapter, unless otherwise specified, are to Meringer & Mayer (1895).]

4 [The intended phrase was: 'it lay so heavily on my breast (*Brust*).' The substituted '*Schwest*' is a non-existent word. This instance is further discussed and explained below, pp. 70–1.]

'*an*zustossen');[1] *contaminations* (e.g. 'er setzt sich auf den Hinterkopf', combined from 'er setzt sich einen Kopf auf' and 'er stellt sich auf die Hinterbeine');[2] and *substitutions* (e.g. 'ich gebe die Präparate in den Briefkasten' instead of 'Brütkasten').[3] There are in addition to these main categories a few others which are less important (or less significant from our own point of view). In the above arrangement into groups it makes no difference whether the transposition, distortion, amalgamation, etc., is concerned with single sounds in a word, with syllables, or with complete words forming part of the intended sentence.

To explain the various kinds of slips of the tongue he had observed, Meringer postulates that different spoken sounds have a different psychical valency. When we innervate the first sound in a word or the first word in a sentence, the excitatory process [*Erregungsvorgang*][T] already extends to the later sounds and the following words, and insofar as these innervations are simultaneous with one another they can exercise a modifying influence on one another. The excitation of the sound that is psychically more intense anticipates other excitations or perseverates after them, and in this way disturbs the less valent process of innervation. The question has therefore to be decided which sounds in a word have the highest valency. Here is Meringer's view: 'If we want to know which sound in a word has the highest intensity, we must observe ourselves when we are searching for a forgotten word, e.g. for a name. Whichever [sound] is the first to come back into consciousness is in every case the one that had the greatest intensity before the word was forgotten' (160). 'The sounds which are of high valency are the initial sound in the root syllable, and the initial sound in the word, and the accentuated vowel or vowels' (162). *Erregung* [55]

I cannot help contradicting him here. Whether the initial sound of the name is one of the elements of highest valency in a word or not, it is certainly untrue that in a forgotten word it is the first to return to consciousness. The rule stated above is therefore inapplicable. If we observe ourselves while searching for a forgotten name, we are comparatively often obliged to express a conviction that it begins with a particular letter. This conviction proves to be unfounded just as often as not. Indeed, I should like to assert that in the majority of cases the initial sound which we announce is a wrong one. In our example of 'Signorelli'

1 ['I call on you to *hiccough to* the health of our Principal' instead of '*drink to*'. This instance is referred to again below, p. 71.]

2 ['He stands on the back of his head' (a meaningless phrase) combined from 'He is obstinate' (literally 'he puts on a head') and 'He gets on his hind legs'.]

3 ['I put the preparation into the letterbox' instead of 'incubator', literally 'hatching-box'.]

[p. 2 above], in fact, the substitute names had lost the initial sound and the essential syllables: it was precisely the less valent pair of syllables – *elli* – which returned to memory[1] in the substitute name Botticelli.

How little attention[2] is paid by the substitute names to the initial sound of the missing name may be learnt, for instance, from the following case:

One day I found it impossible to recall the name of the small country of which *Monte Carlo* is the chief town. The substitute names for it ran: *Piedmont*, *Albania*, *Montevideo*, *Colico*. *Albania* was soon replaced in my mind with *Montenegro*; and it then occurred to me that the syllable 'Mont' (pronounced 'Mon') was found in all the substitute names except the last. Thus it was easy for me, starting from the name of Prince Albert [the ruling Prince], to find the forgotten name *Monaco*. *Colico* gives a pretty close imitation of the sequence of syllables and the rhythm of the forgotten name.[3]

If we allow ourselves to suppose that a mechanism similar to that which has been demonstrated for the forgetting of names could also play a part in the phenomena of slips of the tongue, we are led to form a more
[56] deeply based judgement of instances of the latter. The disturbance in speaking which is manifested in a slip of the tongue can in the first place be caused by the influence of another component of the same speech – by an anticipatory sound, that is, or by a perseveration – or by another formulation of the ideas contained within the sentence or context that it is one's intention to utter. This is the type to which all the above examples borrowed from Meringer & Mayer belong. The disturbance could, however, be of a second kind, analogous to the process in the Signorelli case; it could result from influences *outside* this word, sentence or context, and arise out of elements which are not intended to be uttered and of whose excitation we only learn precisely through the actual disturbance. What these two ways in which slips of the tongue arise have in common would be the simultaneity of the interfering excitation; what differentiates them would be the position of the excitation inside or outside the sentence or context. The difference does not at first appear great insofar as it concerns certain deductions that can be made from the symptomatology of slips of the tongue. It is clear, however, that

1 [In the editions before 1924: 'to consciousness'.]

2 [This paragraph and the next were added in 1907.]

3 [This example was used later by Freud in Lecture VI of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 97–8. He states there (in a slightly different and perhaps more lucid account of the episode) that the replacement of *Albania* with *Montenegro* was probably due to the contrast between black and white; and that it was thoughts connected with *Munich* – which is also *Monaco* in Italian – which had caused him to forget the name.]

only in the former case is there any prospect of drawing conclusions from the phenomena of slips of the tongue about a mechanism which links sounds and words with one another so that they mutually influence their articulation – conclusions, that is, such as the philologist hoped to arrive at from studying slips of the tongue. In the case of interference from influences *outside* the same sentence or context of what is being said, it would be above all a matter of getting to know what the interfering elements are – after which the question would arise whether the mechanism of this disturbance, too, can reveal the supposed laws of speech formation.

Meringer & Mayer cannot be said to have overlooked the possibility that disturbances of speech may be the result of 'complicated psychical influences', of elements outside the same word, sentence or sequence of spoken words. They were bound to observe that the theory which asserts that sounds are of unequal psychical valency is strictly speaking only adequate for explaining sound disturbances, together with sound anticipations and perseverations. Where word disturbances cannot be reduced to sound disturbances (as, for instance, in substitutions and contaminations of words), they have not hesitated to look *outside* the intended [57]
context for the cause of the slip – a procedure which they justify by some good examples. I quote the following passages:

'Ru. was speaking of occurrences which, within himself, he pronounced to be "*Schweinereien* [disgusting, literally piggish]". He tried, however, to express himself mildly, and began: "But then facts came to '*Vorschwein*' . . ."[1] Mayer and I were present and Ru. confirmed his having thought "*Schweinereien*". The fact of this word which he thought being betrayed in "Vorschwein" and suddenly becoming operative is sufficiently explained by the similarity of the words.' (62)

'Just as in contaminations, so also – and probably to a much higher degree – in substitutions an important role is played by "floating" or "wandering" speech images. Even if they are beneath the threshold of consciousness they are still near enough to be operative, and can easily be brought into play by any resemblance they may have to the complex that is to be spoken. When this is so they cause a deviation in the train of words or cut across it. "Floating" or "wandering" speech images are often, as we have said, stragglers following after speech processes which have recently terminated (perseverations).' (73)

'Resemblance can also cause a deviation when another, similar word lies a short way below the threshold of consciousness, *without a decision*

1 [Ru. intended to say 'came to "*light*"' and should have used the word 'Vor*schein*'. Instead, he used the meaningless word 'Vor*schwein*'.]

to speak it having been reached. This is the case with substitutions. – Thus I hope that my rules will of necessity be confirmed when they are tested. But for this it is necessary (if the speaker is someone else) *that we should obtain a clear notion of everything that was in the speaker's thoughts*.[1] Here is an instructive case. Li., a schoolmaster, said in our presence: "Die Frau würde mir Furcht ein*l*agen."[2] I was taken aback, for the *l* struck me as inexplicable. I ventured to draw the speaker's attention to his slip in saying "ein*l*agen" for "ein*j*agen", upon which he at once replied: "Yes, the reason was that I thought: I should not be 'in der *Lage* [in a position]', etc."

[58] 'Here is another case. I asked R. von Schid. how his sick horse was getting on. He replied: "Ja, das *draut* . . . dauert vielleicht noch einen Monat."[3] I could not understand the "*draut*", with an *r*, for the *r* in "*dauert*" could not possibly have had this result. So I drew his attention to it, whereupon he explained that his thought had been: "das ist eine *traurige* Geschichte [it's a *sad* story]." Thus the speaker had two answers in his mind and they had been intermixed.' (97)

It is pretty obvious that the consideration of 'wandering' speech images which lie below the threshold of consciousness and are not intended to be spoken, and the demand for information about everything that had been in the speaker's mind, are procedures which constitute a very close approach to the state of affairs in our 'analyses'. We too are looking for unconscious material; and we even look for it along the same path, except that, in proceeding from the ideas that enter the mind of the person who is being questioned to the discovery of the disturbing element, we have to follow a longer path, through a complicated series of associations.

I shall dwell for a moment on another interesting process, to which Meringer's examples bear witness. The author himself holds that it is some sort of similarity between a word in the sentence intended to be spoken and another word not so intended which permits the latter to make itself felt in consciousness by bringing about a distortion, a composite figure, or a compromise formation (contamination):

jagen,	dauert,	Vorschein
lagen,	traurig,	. . . schwein.

1 My italics.

2 [He intended to say: 'The lady would strike (*einjagen*) terror into me.' But instead of '*einjagen*' he said '*einlagen*', which is a non-existent verb – though '*Lage*' is a familiar noun meaning 'position'.]

3 [What he intended to say was: 'Well, it will last (*dauert*) another month perhaps.' Instead of '*dauert*' he used the meaningless word '*draut*'.]

Now in my *Interpretation of Dreams* (1900*a*) I have demonstrated the part played by the work of *condensation* [*Verdichtungsarbeit*][T] in forming what is called the manifest dream content out of the latent dream thoughts. A similarity of any sort between two elements of the unconscious material – a similarity between the things themselves or between their verbal presentations [*Wortvorstellungen*][T] – is taken as an opportunity for creating a third, which is a composite or compromise idea. In the dream content this third element represents both its components; and it is as a consequence of its originating in this way that it so frequently has various contradictory characteristics. The formation of substitutions and contaminations which occurs in slips of the tongue is accordingly a beginning of the work of condensation which we find taking a most vigorous share in the construction of dreams.[1]

Verdichtung

[59]

In a short essay designed for a wider circle of readers Meringer (1900) has claimed that a special practical significance attaches to particular cases in which one word is put for another – viz. to those cases in which a word is replaced with another that has the opposite meaning. 'You probably still recall', he writes, 'the way in which the president of the lower house of the Austrian parliament *opened* the sitting a short while ago: "Gentlemen: I take notice that a full quorum of members is present and herewith declare the sitting *closed*!" His attention was only drawn by the general merriment and he corrected his mistake.[2] In this particular case the explanation no doubt was that the president secretly *wished* he was already in a position to close the sitting, from which little good was to be expected. But this accompanying idea, as frequently happens, broke through, at least partially, and the result was "closed" instead of "open" – the opposite, that is, of what was intended to be expressed. Now extensive observations have taught me that words with opposite meanings are, quite generally, very often interchanged; they are already associated in our linguistic consciousness, they lie very close to each other and it is easy for the wrong one to be evoked.'[3]

It cannot be said that in all cases where words are replaced with their opposites it is as easy as in this instance of the president to show the probability of the slip being a consequence of a contradiction arising in the speaker's mind against the uttered sentence. We found an analogous

1 [Cf. Section A of Chapter VI of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 248 ff.]

2 [This example was later quoted by Freud in Lecture II of his *Introductory Lectures* (1916–17*a*), ibid., **15**, 31, and again in his posthumously published paper 'Some Elementary Lessons in Psycho-Analysis' (1940*b*), ibid., **23**, 265 f., which was written in 1938.]

3 [Cf. Freud's own later paper on 'The Antithetical Meaning of Primal Words' (1910*e*), ibid., **11**, 145 f.]

[60] mechanism in our analysis of the *aliquis* example [p. 8 above]. There the internal contradiction expressed itself in a word being forgotten, instead of its being replaced with its opposite. But in order to soften the distinction we may note that the word *aliquis* is in fact incapable of having an opposite like 'to close' and 'to open', and that 'to open' is a word that cannot be forgotten as it is too familiar a part of our vocabulary.

If the last examples of Meringer & Mayer show that the disturbance of speech can arise, on the one hand, from the influence of anticipatory or perseverating sounds and words of the same sentence which are intended to be spoken, and, on the other hand, from the effect of words outside the intended sentence *whose excitation would not otherwise have been revealed*, the first thing we shall want to know is whether the two classes of slips of the tongue can be sharply divided, and how an example of one class can be distinguished from a case of the other. At this point in the discussion one must however bear in mind the views expressed by Wundt, who deals with the phenomena of slips of the tongue in the course of his comprehensive discussion of the laws of the development of speech.

According to him, a feature that is never missing from these and other related phenomena is the activity of certain psychical[1] influences. 'First of all, they have a positive determinant in the form of the uninhibited stream of *sound associations* and *word associations* evoked by the spoken sounds. In addition there is a negative factor in the form of the suppression or relaxation of the inhibitory effects of the will on this current, and of the attention which is also active here as a function of the will. Whether this play of association manifests itself by a coming sound being anticipated, or by the preceding sounds being reproduced, or by a habitually practised sound being intercalated between others, or finally by quite different words, which stand in an associative relation to the sounds that are spoken, having an effect upon them – all these indicate only differences in the direction and at the most in the scope of the associations taking place, and not differences in their general nature. In some cases, too, it may be doubtful to which form a certain disturbance is to be assigned, or whether it would not be more justifiable, *in* [61] *accordance with the principle of the complication of causes*,[2] to trace it back to a concurrence of several motive forces [*Motive*][T].' (Wundt, 1900, 380–1.) [Cf. below, p. 70.]

1 [This word is, in fact, italicized by Wundt (1900, 380).]

2 My italics. [Freud was no doubt regarding this as equivalent to his own concept of 'overdetermination'. (Cf. 1895*d*; *RSE*, **2**, 189 *n*. 1.)]

I consider these observations of Wundt's fully justified and very instructive. Perhaps it would be possible to emphasize more definitely than Wundt does that the positive factor favouring the slip of the tongue (the uninhibited stream of associations) and the negative factor (the relaxation of the inhibiting attention) invariably achieve their effect in combination, so that the two factors become merely different ways of regarding the same process. What happens is that, with the relaxation of the inhibiting attention – in still plainer terms, *as a result of* this relaxation – the uninhibited stream of associations comes into action.

Among the slips of the tongue that I have collected myself, I can find hardly one in which I should be obliged to trace the disturbance of speech simply and solely to what Wundt [1900, 392] calls the 'contact effect of sounds'. I almost invariably discover a disturbing influence in addition which comes from something *outside* the intended utterance; and the disturbing element is either a single thought that has remained unconscious, which manifests itself in the slip of the tongue and which can often be brought to consciousness only by means of searching analysis, or it is a more general psychical motive force which is directed against the entire utterance.

(1) My daughter had made an ugly face when she took a bite at an apple, and I wanted to quote to her:

> Der Affe gar possierlich ist,
> Zumal wenn er vom Apfel frisst.[1]

But I began: 'Der Apfe . . .' [a non-existent word]. This looks like a contamination of '*Affe* [ape]' and '*Apfel* [apple]' (a compromise formation), or it might be regarded as an anticipation of the word 'Apfel' that was in preparation. The circumstances were, however, more precisely as follows. I had already begun the quotation once before and had not made a slip of the tongue the first time. I only made a slip when [62]
I repeated it. The repetition was necessary because the person I was addressing had had her attention distracted from another quarter and she had not been listening to me. I must include the fact of the repetition, together with my impatience to have done with my sentence, among the motives of the slip which made its appearance as a product of condensation.

(2) My daughter said: 'I am writing to Frau Schresinger . . .' The lady's name is Schlesinger. This slip of the tongue is probably connected with a

1 [The ape's a very comic sight
When from an apple he takes a bite.]

trend towards making articulation easier, for an *l* is difficult to pronounce after a repeated *r*. I must add, however, that my daughter made this slip a few minutes after I had said '*Apfe*' for '*Affe*'. Now slips of the tongue are in a high degree contagious, like the forgetting of names [p. 35 f. above] – a peculiar fact which Meringer & Mayer have noticed in the case of the latter. I cannot suggest any reason for this psychical contagiousness.

(3) 'I shut up like a *Tassenmescher* [a non-existent word] – I mean *Taschenmesser* [pocket-knife]', said a woman patient at the start of the hour of treatment. Here again a difficulty in articulation (cf. 'Wiener Weiber Wäscherinnen waschen weisse Wäsche' [Viennese washer-women wash white washing], 'Fischflosse' [fish-fin] and similar tongue-twisters) could serve as an excuse for her interchanging the sounds. When her attention was drawn to her slip, she promptly replied: 'Yes, that's only because you said "*Ernscht*" today.' I had, in fact, received her with the remark: 'Today we shall really be in earnest ["*Ernst*"]' (because it was going to be the last session before the holidays), and had jokingly broadened '*Ernst*' into '*Ernscht*'.[1] In the course of the hour she repeatedly made further slips of the tongue, and I finally observed that she was not merely imitating me but had a special reason for dwelling in her unconscious on the word '*Ernst*' in its capacity as a name ['Ernest'].[2]

[63] (4) 'I've got such a cold, I can't *durch die Ase natmen* – I mean, *Nase atmen*',[3] the same patient happened to say another time. She knew immediately how she had come to make the slip. 'Every day I get on the tram in Hasenauer Street, and while I was waiting for one to come along this morning it struck me that if I was French I should say "*Asenauer*", as the French always drop their aitches at the beginning of a word.' She then brought a series of reminiscences about French people of her acquaintance, and came in a very roundabout manner to a memory of having played the part of Picarde in the short play *Kurmärker und Picarde*[4] when she was a girl of fourteen, and of having spoken broken German in the part. The chance arrival at her boarding house of a guest from Paris had awoken the whole series of memories. The interchanging

1 [An uneducated way of pronouncing the word.]

2 In fact she turned out to be under the influence of unconscious thoughts about pregnancy and contraception. By the words 'shut up like a pocket-knife', which she uttered consciously as a complaint, she wanted to describe the position of a child in the womb. The word '*Ernst*' in my opening remark had reminded her of the name (S. Ernst) of a well-known Viennese firm in the Kärntnerstrasse which used to advertise the sale of contraceptives.

3 [She meant to say: 'I can't breathe through my nose.' Her actual last two words, '*Ase natmen*', have no meaning.]

4 [A *Singspiel* by the Berlin dramatist Louis Schneider (1805–78).]

of the sounds was therefore the result of a disturbance by an unconscious thought from an entirely different context.

(5) A slip of the tongue had a similar mechanism in the case of another woman patient, whose memory failed her in the middle of reproducing a long-lost recollection of childhood. Her memory would not tell her what part of her body had been grasped by a prying and lascivious hand. Immediately afterwards she called on a friend with whom she discussed summer residences. When she was asked where her cottage at M. was situated she answered: 'on the *Berglende* [hill-thigh]' instead of *Berglehne* [hill-side].

(6) When I asked another woman patient at the end of the session how her uncle was, she answered: 'I don't know, nowadays I only see him *in flagranti*.' Next day she began: 'I am really ashamed of myself for having given you such a stupid answer. You must of course have thought me a very uneducated person who is always getting foreign words mixed up. I meant to say: *en passant*.' We did not as yet know the source of the foreign phrase which she had wrongly applied. In the same session, however, while continuing the previous day's topic, she brought up a reminiscence in which the chief role was played by being caught *in flagranti*. The slip of the tongue of the day before had therefore [64] anticipated the memory which at the time had not yet become conscious.

(7) At a certain point in the analysis of another woman patient I had to tell her that I suspected her of having been ashamed of her family during the period we were just then concerned with, and of having reproached her father with something we did not yet know about. She remembered nothing of the kind and moreover declared it was unlikely. However, she continued the conversation with some remarks about her family: 'One thing must be granted them: they are certainly unusual people, they all possess *Geiz* [greed] – I meant to say "*Geist* [intelligence]".' And this was in fact the reproach which she had repressed from her memory. It is a frequent occurrence for the idea one wants to withhold to be precisely the one which forces its way through in the form of a slip of the tongue. We may compare Meringer's case of 'zum Vorschwein gekommen' [p. 49 above]. The only difference is that Meringer's speaker wanted to keep back something that was in his consciousness, whereas my patient did not know what was being kept back, or, to put it in another way, did not know she was keeping something back and what that something was.

(8)[1] The next example of a slip of the tongue is also to be traced back to something intentionally withheld. I once met two ladies in the

1 [This example was added in 1917. It had previously been used by Freud in Lecture IV of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 56.]

Dolomites who were dressed up in walking clothes. I accompanied them part of the way, and we discussed the pleasures and also the trials of spending a holiday in that way. One of the ladies admitted that spending the day like that entailed a good deal of discomfort. 'It is certainly not at all pleasant', she said, 'if one has been tramping all day in the sun and has perspired right through one's blouse and chemise.' In this sentence she had to overcome a slight hesitation at one point. Then she continued: 'But then when one gets "nach *Hose*" and can change . . .' No interpellation, I fancy, was necessary in order to explain this slip. The lady's intention had obviously been to give a more complete list of her clothes: blouse, chemise and *Hose* [drawers]. Reasons of propriety led her to suppress any mention of the third article of linen. But in the next sentence,
[65] with its different subject matter, the suppressed word emerged against her will, in the form of a distortion of the similar word 'nach *Hause* [home]'.

(9) 'If you want to buy carpets,' a lady said to me, 'you must go to Kaufmann [a proper name, also meaning "merchant"] in the Matthäusgasse [Matthew Street]. I think I can give you a recommendation there.' 'At Matthäus . . .,' I repeated, 'I mean Kaufmann's.' My repeating one name in the other's place looks like a result of my thoughts being distracted. They really were distracted by what the woman said, for she diverted my attention to something much more important to me than carpets. As a matter of fact, the house in which my wife lived when she was my fiancée was in the Matthäusgasse. The entrance to the house was in another street, and I now noticed that I had forgotten its name and could only make it conscious in a roundabout way. The name Matthäus, which I was lingering over, was therefore a substitute name for the forgotten street name. It was more suitable for this purpose than the name Kaufmann, for Matthäus is exclusively a personal name, while Kaufmann is not, and the forgotten street also bears the name of a person: Radetzky.

(10) The following case could just as appropriately be included in the chapter below on 'Errors' [Chapter X], but I quote it here since the phonetic relations, which were the basis of one word being put in place of another, are quite unusually clear. A woman patient told me a dream: A child had resolved to kill itself by means of a snake-bite. It carried out its resolution. She watched it writhing in convulsions, and so on. She had now to find the impressions of the previous day which the dream had taken as its starting point. She immediately recalled that on the previous evening she had listened to a public lecture on first aid for

snake-bites. If an adult and a child were bitten at the same time, the child's injury should be attended to first. She also remembered what the lecturer had prescribed by way of treatment. It would very much depend, he had said, on what kind of snake caused the bite. I interrupted at this point and asked: Surely he must have said that we have very few poisonous kinds in these parts and he must have told you which are the dangerous ones? 'Yes, he particularly mentioned the "*Klapperschlange* [rattlesnake]".' My laughter drew her attention to her having said something wrong. She did not correct the *name*, but took back her [66]
statement: 'Yes, of course, they aren't found here; he was talking of the viper. How can I have got the idea of the rattlesnake?' I suspected it was due to interference by the thoughts which had hidden behind her dream. Suicide by means of a snake-bite could hardly be anything other than an allusion to the beautiful Cleopatra [in German: '*Kleopatra*']. The great similarity between the sound of the two words, the occurrence in both of the same letters 'Kl . . . p . . . r' in the same order, and of the same stressed 'a', was unmistakable. The close connection between the names '*Klapper*schlange' and '*Kleopatra*' resulted in her judgement being momentarily restricted, so that she saw no objection to asserting that the lecturer had given his audience in Vienna instructions on how to treat rattlesnake bites. In the ordinary way she knew as well as I did that that species of snake is not among the fauna of our country. We will not blame her for her equal lack of hesitation in transferring the rattlesnake to Egypt, for it is usual for us to lump together everything which is non-European and exotic, and I had myself to reflect for a moment before declaring that the rattlesnake is confined to the New World.

The continuation of the analysis brought further confirmation. On the previous day the dreamer had for the first time inspected the Mark *Antony* monument by Strasser, which stood in the vicinity of her home.[1] This then was the second exciting cause of the dream (the first having been the lecture on snake-bites). In the continuation of the dream she was rocking a child in her arms. This scene reminded her of Gretchen.[2] Further ideas which occurred to her brought reminiscences of *Arria und Messalina*.[3] From the fact that the names of so many plays made their appearance in the dream thoughts we may already have a suspicion that in her earlier years the dreamer had cherished a secret passion for the

1 [A bronze group in Vienna representing the Triumph of Mark Antony by the Austrian sculptor Artur Strasser (1854–1927).]

2 [In Goethe's *Faust*.]

3 [A tragedy by the Viennese playwright Adolf Wilbrandt (1837–1911).]

profession of actress. The beginning of the dream – 'A child had resolved to put an end to its life by means of a snake-bite' – had in fact no other
[67] meaning than that when she was a child she had made up her mind to become a famous actress one day. Finally, from the name 'Messalina' the path of thoughts branched off which led to the essential content of the dream. Certain recent events had made her apprehensive that her only brother might make a socially unsuitable marriage, a *mésalliance* with a non-*Aryan*.

(11)[1] I will reproduce here an entirely innocent example (or perhaps one whose motives were insufficiently elucidated), because it displays a transparent mechanism.

A German who was travelling in Italy needed a strap to tie up his damaged trunk. For 'strap' ['*Riemen*'] the dictionary gave him the Italian word '*coreggia*'. It will be easy, he thought, to remember the word by thinking of the painter *Correggio*. After that he went into a shop and asked for '*una ribera*'.

He had apparently not been successful in replacing the German word with the Italian one in his memory, but his efforts were nevertheless not entirely unsuccessful. He knew he had to keep in mind the name of a painter, and in this way he hit upon the name not of the painter who sounded much the same as the Italian word, but of another one who resembled the German word '*Riemen*'.[2] I could of course have quoted the present case just as appropriately as an example of the forgetting of a name rather than of a slip of the tongue.

When I was collecting slips of the tongue for the first edition of this book I proceeded by subjecting to analysis every case I was able to observe, and accordingly included the less impressive ones. Since then a number of other people have undertaken the amusing task of collecting and analysing slips of the tongue, and have thus enabled me to select from a richer material.

(12) A young man said to his sister: 'I've completely fallen out with the D.s now. We're not on speaking terms any longer.' 'Yes indeed!' she answered, 'they're a fine *Lippschaft*.'[3] She meant to say '*Sippschaft* [lot, crew]', but in the slip she compressed two ideas: viz. that her brother had himself once begun a flirtation with the daughter of this family, and that this daughter was said to have recently become involved in a serious and irregular *Liebschaft* [love affair].

1 [This example and the following one (No. 12) were added in 1907.]

2 [Ribera, the well-known seventeenth-century Spanish painter.]

3 [A non-existent word.]

(13)[1] A young man addressed a lady in the street in the following words: [68]
'If you will permit me, madam, I should like to "*begleit-digen*" you.' It was obvious what his thoughts were: he would like to '*begleiten* [accompany]' her, but was afraid his offer would '*beleidigen* [insult]' her. That these two conflicting emotional impulses found expression in one word – in the slip of the tongue, in fact – indicates that the young man's real intentions were at any rate not of the purest, and were bound to seem, even to himself, insulting to the lady. But while he attempted to conceal this from her, his unconscious played a trick on him by betraying his real intentions. But on the other hand he in this way, as it were, anticipated the lady's conventional retort: 'Really! What do you take me for? How dare you *insult* me!' (Reported by O. Rank.)

I will next quote a number of examples[2] from an article by Stekel, entitled 'Unconscious Admissions', in the *Berliner Tageblatt* of January 4, 1904.

(14) 'An unpleasant part of my unconscious thoughts is disclosed by the following example. I may start by stating that in my capacity as a doctor I never consider my remuneration but only have the patient's interest in mind: that goes without saying. I was with a woman patient to whom I was giving medical attention in a period of convalescence after a serious illness. We had been through hard days and nights together. I was happy to find her improved; I painted a picture for her benefit of the delights of a stay in Abbazia, and concluded by saying: "If, as I hope, you will *not* leave your bed soon. . . ." This obviously owed its origin to an egoistic motive in the unconscious, namely that I should be able to continue treating this well-to-do patient some time longer – a wish that is entirely foreign to my waking consciousness and which I would indignantly repudiate.'

(15) Here is another example from Stekel. 'My wife was engaging a French governess for the afternoons, and after agreement had been reached on the terms, wanted to retain her testimonials. The Frenchwoman asked to be allowed to keep them, giving as her reason: *Je cherche encore pour les après-midis*, *pardon*, *pour les avant-midis* [I am [69]
still looking for work in the afternoons – I mean, in the forenoons]. She obviously had the intention of looking round elsewhere and perhaps finding better terms – an intention which she in fact carried out.'

(16) From Stekel: 'I had to give a stiff lecture to a wife; and her husband, at whose request I did it, stood outside the door listening. At the

1 [This example was added in 1912. Freud later alluded to it in Lectures II and III of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 30 and 38.]

2 [These examples (Nos. 14–20) were added in 1907.]

end of my sermon, which had made a visible impression, I said: "Goodbye, sir." To any well-informed person I was thus betraying the fact that my words were addressed to the husband and that I had spoken them for his benefit.'

(17) Stekel reports of himself that at one time he had two patients from Trieste in treatment whom he always used to address the wrong way round. 'Good morning, Herr Peloni', he would say to Askoli, and 'Good morning, Herr Askoli' to Peloni. He was at first inclined not to attribute any deeper motive to this confusion but to explain it as being due to the numerous points of resemblance between the two gentlemen. However, it was easy for him to convince himself that the interchanging of the names corresponded in this case to a kind of boastfulness: he was able in this way to let each of his Italian patients know that he was not the only visitor from Trieste who had come to Vienna in search of his medical advice.

(18) Stekel reports that during a stormy general meeting he said: 'We shall now *streiten* [quarrel]' (instead of '*schreiten* [proceed]') 'to point four on the agenda.'

(19) A professor declared in his inaugural lecture: 'I am not *geneigt* [inclined]' (instead of '*geeignet* [qualified]') 'to describe the services of my most esteemed predecessor.'[1]

(20) To a lady whom he suspected of having Graves' disease Stekel said: 'You are about a *Kropf* [goitre]' (instead of '*Kopf* [head]') 'taller than your sister.'

(21)[2] Stekel reports: 'Someone wanted to describe the relationship of two friends and to bring out the fact that one of them was Jewish. He said: "They lived together like Castor and Pollak."[3] This was certainly not said as a joke; the speaker did not notice the slip himself until I drew his attention to it.'

[70] (22) Occasionally a slip of the tongue takes the place of a detailed characterization. A young woman who wore the breeches in her home told me that her sick husband had been to the doctor to ask what diet he ought to follow for his health. The doctor, however, had said that a special diet was not important. She added: 'He can eat and drink what *I* want.'[4]

1 [Quoted by Freud in Lecture II of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 30.]

2 [This and the following example (No. 22) were added in 1910.]

3 [Castor and Pollux were the 'heavenly twins' of Greek mythology. Pollak was a common Jewish name in Vienna.]

4 [Quoted by Freud in Lecture II of his *Introductory Lectures* (1916–17*a*), ibid., **15**, 32.]

The following[1] two examples given by Reik (1915*a*) have their origin in situations where slips of the tongue occur especially easily – situations in which more must be kept back than can be said.

(23) A gentleman was offering his condolences to a young lady whose husband had recently died, and he intended to add: 'You will find consolation in *devoting* [*widmen*] yourself entirely to your children.' Instead he said '*widwen*'.[2] The suppressed thought referred to consolation of another kind: a young and pretty widow [*Witwe*] will soon enjoy fresh sexual pleasures.

(24) At an evening party the same gentleman was having a conversation with the same lady about the extensive preparations being made in Berlin for Easter, and asked: 'Have you seen today's display [*Auslage*] at Wertheim's?[3] The place is completely *decollated*.' He had not dared to express his admiration for the beautiful lady's *décolletage*, while the word '*Auslage*' ['display'] was used unconsciously in two senses.

The same condition applies to another case, observed by Dr Hanns Sachs, of which he has tried to give an exhaustive account:

(25) 'A lady was telling me about a common acquaintance. The last time she saw him, he was, she said, as elegantly dressed as ever: in particular he was wearing strikingly beautiful brown *Halbschuhe* [low shoes]. When I asked where she had met him she replied: "He rang at the door of my house and I saw him through the blinds, which were down. But I didn't open the door or give any other sign of life, as I didn't want him to know I was already back in town." While I was listening to her I had an idea that she was concealing something from me, most probably the fact that her reason for not opening the door was that she was not alone and [71]
not properly dressed to receive visitors; and I asked her somewhat ironically: "So you were able to admire his *Hausschuhe* [house shoes] – *Halbschuhe* [low shoes], I mean – through the blinds when they were drawn?" In *Hausschuhe* I was giving expression to the thought of her *Hauskleid* [literally house dress, i.e. *négligée*] which I had refrained from uttering. There was on the other hand a temptation to get rid of the word "*Halb* [half]" for the reason that it was precisely this word which contained the core of the forbidden answer: "You are only telling me *half* the truth and are hiding the fact that you were *half*-dressed." The slip of the tongue was encouraged by the additional circumstance that we had been talking directly before about this particular gentleman's married

1 [This paragraph and Nos. 23–6 were added in 1917.]

2 [A non-existent word.]

3 [A well-known department store.]

life, about his *häuslich* [domestic] happiness; this no doubt helped to determine the displacement [of "*Haus*"] on to him. Finally, I must confess that envy on my part may perhaps have contributed to my placing this elegant gentleman in the street in house shoes; only recently I myself bought a pair of brown low shoes, which are certainly not "strikingly beautiful" any longer.'

Times of war like the present produce numerous slips of the tongue which there is not much difficulty in understanding.

(26) 'What regiment is your son with?' a lady was asked. She replied: 'With the 42nd Murderers' ['*Mörder*' – instead of '*Mörser*', 'Mortars'].

(27)[1] Lieutenant Henrik Haiman writes from the front (1917): 'While I was reading an absorbing book, I was torn away to act temporarily as reconnaissance telephone operator. When the artillery post gave the signal to test the line I reacted with: "Duly tested and in order; *Ruhe*."[2] According to regulations the message should have run: "Duly tested and in order; *Schluss* [end (of message)]." My aberration is to be explained by my annoyance at being interrupted while I was reading.'

[72] (28)[3] A sergeant instructed his men to give their people at home their correct addresses, so that '*Gespeckstücke*' should not go astray.[4]

(29) The following exceedingly fine example, which is also significant in view of its most unhappy background, I owe to Dr L. Czeszer, who observed it while he was living in neutral Switzerland during the war and who analysed it exhaustively. I quote his letter verbatim with some inessential omissions:

'I am taking the liberty of sending you an account of a slip of the tongue of which Professor M. N. of O. University was the victim in one of the lectures that he gave on the psychology of feelings during the summer term which has just ended. I must start by saying that these lectures took place in the aula of the university before a great crowd of interned French prisoners of war as well as of students, most of whom were French-Swiss whose sympathies lay strongly on the side of the *Entente*. In the town of O., as in France itself, "*boche*" is the name in universal and exclusive use for the Germans. But in public announcements, and in lectures and the like, senior public servants, professors

1 [This example was added in 1919.]

2 ['Quiet'; often used as an exclamation: 'Silence!']

3 [This example, and Nos. 30 and 31, were added in 1920; No. 29 was added in 1919.]

4 [He meant to say '*Gepäckstücke*' ('parcels'). '*Gespeckstücke*' is a non-existent word; but '*Speckstücke*' would mean 'bits of bacon'. The vowel after the 'p' has practically the same sound in each case (whether written 'e' or 'ä').]

and other persons in responsible positions make an effort, for the sake of neutrality, to avoid the ominous word.

'Professor N. was in the middle of discussing the practical significance of affects, and intended to quote an example illustrating how an affect can be deliberately exploited in such a way that a muscular activity which is uninteresting in itself becomes charged with pleasurable feelings, and so made more intense. He accordingly told a story – he was, of course, speaking in French – which had just then been reproduced in the local papers from a German one. It concerned a German schoolmaster who had put his pupils to work in the garden, and in order to encourage them to work with greater intensity invited them to imagine that with every clod of earth that they broke up they were breaking a French skull. Every time the word for "German" came up in the course of his story N. of course said "*allemand*" quite correctly and not "*boche*". But when he came to the point of the story he gave the schoolmaster's words in the following form: *Imaginez-vous qu'en chaque moche vous écrasez le crâne d'un Français*. That is to say, instead of *motte* [the French word for "clod"] – *moche*! [73]

'One can see very clearly how this scrupulous scholar took a firm grip on himself at the beginning of his story, to prevent himself from yielding to habit – perhaps even to temptation – and from permitting a word that had actually been expressly proscribed by a federal decree to fall from the rostrum of the university aula! And at the precise moment at which he had successfully said "*instituteur allemand* [German schoolmaster]" with perfect correctness for what was the last time, and was hurrying with an inward sigh of relief to the conclusion, which seemed to offer no pitfalls – the word which had been suppressed with so much effort caught hold of the similar-sounding "*motte*", and the damage was done. Anxiety about committing a political indiscretion, perhaps a suppressed desire to employ the usual word in spite of everything – the word that everyone expected – and the resentment of one who was born a republican and a democrat at every restriction on the free expression of opinion – all these interfered with his main intention of giving a punctilious rendering of the illustration. The interfering trend was known to the speaker and he had, as we cannot but suppose, thought of it directly before he made the slip of the tongue.

'Professor N. did not notice his slip: at least he did not correct it, which is something one usually does quite automatically. On the other hand the slip was received by the mainly French audience with real satisfaction and its effect was exactly as though it had been an intentional play upon

words. I myself followed this seemingly innocent occurrence with real inner excitement. For although I had for obvious reasons to forgo asking the professor the questions prompted by the psychoanalytic method, I nevertheless took his slip of the tongue as conclusive evidence of the correctness of your theory about the determining of parapraxes and the deep-lying analogies and connections between slips of the tongue and jokes.'

(30) The following slip of the tongue, which was reported by an Austrian officer, Lieutenant T., on his return home, also had its origin among the melancholy impressions of wartime:

'For several months of the time that I was a prisoner of war in Italy I
[74] was one of two hundred officers accommodated in a small villa. During this time one of our number died of influenza. The impression made by this event was naturally a deep one, for the circumstances in which we found ourselves, the lack of medical assistance and the helplessness of our condition at the time made it more than probable that an epidemic would break out. – We had laid out the dead man in a cellar room. In the evening, after I had taken a walk around our house with a friend, we both expressed a wish to see the dead body. The sight which greeted me on entering the cellar (I was the one in front) startled me violently, for I had not expected to find the bier so near the entrance and to be confronted at such close quarters with a face transformed by the play of the candlelight into something set in movement. While the effects of this scene were still on us we continued our walk around the house. When we came to a place from where there was a view of the park bathed in the light of a full moon, a brightly lit meadow and beyond it a thin veil of mist, I described the picture that it conjured up; it was as if I saw a ring of elves dancing under the fringe of the neighbouring pine-trees.

'The next afternoon we buried our dead comrade. The course of our walk from our prison to the cemetery of the small neighbouring village was both bitter and humiliating for us; for a mocking, jeering crowd made up of shouting half-grown lads and rough, noisy villagers took advantage of the occasion to give open vent to their emotions, which were a mixture of curiosity and hatred. My feeling that even in this defenceless condition we could not escape insults and my disgust at the demonstration of coarseness overwhelmed me with bitterness until the evening. At the same hour as on the previous day and with the same companion, I began to walk along the gravel path around our house, just as I had done before; and as we passed by the grating of the cellar behind which the dead body had lain I was seized by the memory of the

impression which the sight of it had made on me. At the place where the brightly lit park once more lay before me, in the light of the same full moon, I stopped and said to my companion: "We could sit down here in the *grave* ['*Grab*'] – grass ['*Gras*'] and *sink* ['*sinken*'] a serenade." My attention was not caught until I made the second slip; I had corrected the first one without having become conscious of the meaning it contained. I now reflected on them and put them together: "in the grave – to sink!" [75]
The following pictures flashed through my mind with lightning rapidity: elves dancing and hovering in the moonlight; our comrade lying on his bier, the impression of movement; some scenes from the burial, the sensation of the disgust I had felt and of the disturbance of our mourning; the memory of some conversations about the infectious illness that had appeared, and the forebodings expressed by several of the officers. Later I remembered that it was the date of my father's death; in view of my usually very poor memory for dates I found this striking.

'Subsequent reflection brought home to me the sameness of the external circumstances on the two evenings: the same time of day and lighting conditions, the identical place and companion. I recalled my uneasy feelings when there had been an anxious discussion of the possibility of the influenza spreading; and I remembered at the same time my inner prohibition against letting myself be overcome by fear. I also became conscious of the significance attaching to the order of the words "we could – in the grave – sink",[1] and I realized that only the initial correction of "grave" into "grass", which had taken place unobtrusively, had led to the second slip ("sink" for "sing") in order to ensure that the suppressed complex should have its full expression.

'I may add that I suffered at the time from alarming dreams about a very close relative. I repeatedly saw her ill and once actually dead. Just before I was taken prisoner I had received news that the influenza was raging with particular virulence in her part of the world, and I had expressed my lively fears to her about it. Since then I had been out of touch with her. Some months later I received news that she had fallen victim to the epidemic a fortnight before the episode I have described!'

(31) The next example of a slip of the tongue throws a flash of light on one of those painful conflicts which fall to the lot of a doctor. A man whose illness was in all probability a fatal one, though the diagnosis had not as yet been confirmed, had come to Vienna to await the solution to his problem, and had begged a friend whom he had known since his

1 ['*Wir könnten ins Grab sinken*' – 'we could sink in the grave'. The order of the words, on which the present point turns, is different in English and in German.]

[76] youth, and who had become a well-known physician, to undertake his treatment. This the friend had with some reluctance finally agreed to do. It was intended that the sick man should stay in a nursing home and the doctor proposed that it should be the 'Hera' sanatorium. 'Surely', objected the patient, 'that is a home for a special type of case only (a maternity home).' 'Oh no!' replied the doctor hastily, 'in the "Hera" they can *umbringen* [put an end to] – I mean, *unterbringen* [take in] – every type of patient.' He then violently disputed the interpretation of his slip. 'Surely you won't believe I have hostile impulses against you?' A quarter of an hour later, as the doctor was going out with the lady who had undertaken to nurse the invalid, he said: 'I can't find anything, and I still don't believe in it. But if it should be so, I am in favour of a strong dose of morphia and a peaceful finish.' It emerged that his friend had stipulated that he (the doctor) should shorten his sufferings by means of a drug as soon as it was confirmed that he was past helping. Thus the doctor had in fact undertaken to put an end to his friend.

(32)[1] Here is a quite especially instructive slip of the tongue which I should not like to omit, although according to my authority it is some twenty years old. 'A lady once advanced the following opinion at a social gathering – and the words show that they were uttered with fervour and under the pressure of a host of secret impulses: "Yes, a woman must be pretty if she is to please men. A man is much better off; as long as he has his *five* straight [*fünf gerade*] limbs he needs nothing more!" This example allows us a good view of the intimate mechanism of a slip of the tongue that results from *condensation* or from a *contamination* (cf. p. 46 f.). It is plausible to suppose that we have here a fusion of two turns of phrase with similar meanings:

as long as he has his *four straight limbs*
as long as he has his *five wits* about him.

Or the element *straight* ['*gerade*'] may have been common to two intended expressions which ran:

as long as he has his *straight* limbs
to treat all *five*(*s*) as *even numbers*[2]

[77] 'There is nothing in fact to prevent us from assuming that *both* turns of phrase, the one about his five wits and the one about "the even number five", played their separate parts in causing first a number, and then the mysterious five instead of the simple four, to be introduced into the

1 [This example was added in 1910.]

2 ['Alle *fünf gerade* sein lassen.' The German '*gerade*' means both 'straight' and 'even'. The meaning of the phrase, literally translated in the text, is: 'To close one's eyes to irregularities.']

sentence dealing with the straight limbs. But this fusion would certainly not have come about if, in the form that appeared in the slip of the tongue, it had not had a good meaning of its own – one expressing a cynical truth which could not of course be admitted to undisguised, coming as it did from a woman. – Finally, we should not omit to draw attention to the fact that the lady's remark, as worded, could pass just as well for a capital joke as for an amusing slip of the tongue. It is simply a question of whether she spoke the words with a conscious or an unconscious intention. In our case the way the speaker behaved certainly ruled out any notion of conscious intention and excluded the idea of its being a joke.'

How closely[1] a slip of the tongue can approximate to a joke is shown in the following case, reported by Rank (1913*b*), in which the woman responsible for the slip actually ended by herself treating it as a joke and laughing at it.

(33) 'A recently married man, whose wife was concerned about preserving her girlish appearance and only with reluctance allowed him to have frequent sexual intercourse, told me the following story which in retrospect [*nachträglich*] both he and his wife found extremely funny. After a night in which he had once again disobeyed his wife's rule of abstinence, he was shaving in the morning in the bedroom which they shared, while his wife was still in bed; and, as he had often done to save trouble, he made use of his wife's powder-puff which was lying on the bedside table. His wife, who was extremely concerned about her complexion, had several times told him not to, and therefore called out angrily: "There you go again, powdering *me* [*mich*] with *your* [*deiner*] puff!" Her husband's laughter drew her attention to her slip (she had meant to say: "you are powdering *yourself* [*dich*] again with my [*meiner*] puff") and she herself ended by joining in his laughter. "To powder" ["*pudern*"] is an expression familiar to every Viennese for "to copulate"; and a powder-puff is an obvious phallic symbol.'

(34)[2] In the following example, too – supplied by Storfer – it might be thought that a joke was intended: [78]

Frau B., who was suffering from an affection of obviously psychogenic origin, was repeatedly recommended to consult a psychoanalyst, Dr X. She persistently declined to do so, saying that such treatment could never be of any value, as the doctor would wrongly trace everything back to

1 [This paragraph and Example 33 were added in 1917.]

2 [Added in 1924.]

sexual things. A day finally came, however, when she was ready to follow the advice, and she asked: 'Nun gut, wann *ordinärt* also dieser Dr X.?'[1]

(35)[2] The connection between jokes and slips of the tongue is also shown in the fact that in many cases a slip of the tongue is nothing other than an abbreviation:

On leaving school, a girl had followed the ruling fashion of the time by taking up the study of medicine. After a few terms she had changed over from medicine to chemistry. Some years later she described her change of mind in the following words: 'I was not on the whole squeamish about dissecting, but when I once had to pull the fingernails off a dead body, I lost my pleasure in the whole of – *chemistry*.'

(36)[3] At this point I insert another slip of the tongue which it needs little skill to interpret. In an anatomy lesson the professor was endeavouring to explain the nasal cavities, which are notoriously a very difficult department of enterology. When he asked whether his audience had understood his presentation of the subject, he received a general reply in the affirmative. Thereupon the professor, who was known for his high opinion of himself, commented: 'I can hardly believe that, since, even in Vienna with its millions of inhabitants, those who understand the nasal cavities can be counted *on one finger*, I mean on the fingers of one hand.'

[79] (37) On another occasion the same professor said: 'In the case of the female genitals, in spite of many *Versuchungen* [temptations] – I beg your pardon, *Versuche* [experiments] . . .'

(38)[4] I am indebted to Dr Alfred Robitsek of Vienna for drawing my attention to two slips of the tongue which were recorded by an old French writer. I reproduce them without translating them:

Brantôme (1527–1614), *Vies des dames galantes*, 'Discours second': 'Si ay-je cogneu une très-belle et honneste dame de par le monde, qui, devisant avec un honneste gentilhomme de la cour des affaires de la guerre durant ces civiles, elle luy dit: "J'ay ouy dire que le roy a faict rompre tous les c . . . de ce pays là." Elle vouloit dire *les ponts*. Pensez que, venant de coucher d'avec son mary, ou songeant à son amant, elle avoit encor ce nom frais en la bouche; et le gentilhomme s'en eschauffa en amours d'elle pour ce mot.

1 [What she meant to say was: 'All right, then, when does this Dr X. have his consulting hours?' She should have used the word '*ordiniert*' for 'has his consulting hours'. Instead, she said '*ordinärt*', which is a non-existent word. '*Ordinär*', however, means 'common', 'vulgar'.]

2 [Added in 1920.]

3 [This example and the following one (No. 37) were added in 1912. They were quoted by Freud in Lectures III and II of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 37 and 30.]

4 [Added in 1910.]

'Une autre dame que j'ai cogneue, entretenant une autre grand' dame plus qu'elle, et luy louant et exaltant ses beautez, elle luy dit après: "Non, madame, ce que je vous en dis, ce n'est point pour vous *adultérer*"; voulant dire *adulater*, comme elle le rhabilla ainsi: pensez qu'elle songeoit à adultérer.'[1]

(39)[2] There are of course more modern examples as well of sexual *doubles entendres* originating in a slip of the tongue. Frau F. was describing her first hour in a language course. 'It is very interesting; the teacher is a nice young Englishman. In the very first hour he gave me to understand "*durch die Bluse*" [through the blouse] – I mean, "*durch die Blume*" [literally 'through flowers', i.e. 'indirectly'] that he would rather take me [80]
for individual tuition.' (From Storfer.)

In the psychotherapeutic procedure[3] which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations [*Einfällen*][T], a thought content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another – that they have put them into a series which implies a recurrence of the same type in their emotional life. – To give another example:[4] a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than me.'

1 ['Thus I knew a very beautiful and virtuous lady of the world who, discoursing with a virtuous gentleman of the court on the affairs of the war during those civil disturbances, said to him: "I have heard tell that the king had a breach made in all the c . . . of that region." She meant to say the "*bridges*" ["*ponts*", which rhymes with the missing French word]. One may suppose that, having just lain with her husband, or thinking of her lover, she had this word freshly on her tongue; and the gentleman was fired with love of her on account of this word.

'Another lady whom I knew, entertaining another lady of higher rank than herself, and praising her and extolling her beauties, she said after to her: "No, madame, what I say to you is not in order to *adulterate* you"; meaning to say *adulate*, as she clad the word thus anew, one may suppose that she was thinking of [adultery and of] adulteration.']

2 [Added in 1924.]

3 [Except where otherwise indicated, the whole of what follows down to p. 73 dates back to 1901.]

4 [This example was inserted in 1907.]

I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. – At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view.

What I find, therefore, both in grosser disturbances of speech and in those more subtle ones which can still be subsumed under the heading of 'slips of the tongue', is that it is not the influence of the 'contact effects of the sounds' [p. 53 above] but the influence of thoughts that lie outside the intended speech which determines the occurrence of the slip and provides an adequate explanation of the mistake. It is not my wish to
[81] throw doubt on the laws governing the way in which sounds modify one another; but by themselves these laws do not seem to me to be sufficiently effective to disturb the process of correct speaking. In the cases that I have studied and explored in some detail these laws represent no more than the preformed mechanism which a more remote psychical motive makes use of for its convenience, though without becoming subject to the sphere of influence of these [phonetic] relations. *In a large number of substitutions* [p. 46 f.] *resulting from slips of the tongue such phonetic laws are completely disregarded*. In this respect I find myself in full agreement with Wundt, who assumes as I do that the conditions governing slips of the tongue are complex and extend far beyond the contact effects of the sounds.

If I accept these 'remoter psychical influences' (as Wundt calls them [cf. above, p. 52] as established, there is nothing, on the other hand, to prevent me at the same time from allowing that, in situations where speaking is hurried and attention is to some extent diverted, the conditions governing slips of the tongue may easily be confined within the limits defined by Meringer & Mayer.[1] For some of the examples collected by these authors a more complicated explanation nevertheless seems more plausible. Take, for instance, one of those quoted above [pp. 46–7]:

'Es war mir auf der *Schwest* . . .
Brust so schwer.'

Was what happened here simply that the sound '*schwe*' forced back the equally valent sound '*bru*' by 'anticipating' it? The idea can hardly be

1 [I.e. may be confined to phonetic factors. Cf. p. 46 above.]

dismissed that the sounds making up '*schwe*' were further enabled to obtrude in this manner because of a special relation. That could only be the association *Schwester* [sister] – *Bruder* [brother]; perhaps also *Brust der Schwester* [sister's breast], which leads one on to other groups of thoughts. It is this invisible helper behind the scenes which lends the otherwise innocent '*schwe*' the strength to produce a mistake in speaking.

There are other slips of the tongue where we may assume that the true disturbing factor is some similarity in sound to obscene words and meanings. Deliberate distortion and deformation of words and expressions, which is so dear to vulgar minds, has the sole purpose of exploiting innocent occasions for hinting at forbidden topics; and this playing with words is so frequent that there would be nothing remarkable in its occurring even when not intended and against one's wishes. To this category no doubt belong such examples as *Eischeissweibchen* (for *Eiweissscheibchen*),[1] *Apopos Fritz* (for *à propos*),[2] *Lokuskapitäl* (for *Lotuskapitäl*),[3] etc.; and perhaps also the *Alabüsterbachse* (*Alabasterbüchse*)[4] of St Mary Magdalen.[5] – 'Ich fordere Sie auf, auf das Wohl unseres Chefs *auf*zustossen' [see p. 46 f. above] can hardly be anything other than an unintentional parody which is perseveration of an intended one. If I were the principal who was being honoured at the ceremony to which the speaker contributed this slip, I should probably [82] [83]

1 [A meaningless term, literally 'egg-shit-female', for 'small slices of white of egg'.]

2 ['Apopos' is a non-existent word; but 'Popo' is the nursery word for 'buttocks'.]

3 [A meaningless word, literally 'W.C. capital', for 'lotus capital', an architectural term.]

4 [A non-existent word (though the middle part of it 'Büste' means 'breast'), for 'alabaster box'.]

5 Making slips of the tongue was a symptom of a woman patient of mine which persisted until it was traced back to the childhood joke of replacing '*ruinieren* [ruin]' with '*urinieren* [urinate]'. – [*Added* 1924:] The temptation to employ the artifice of a slip of the tongue for enabling improper and forbidden words to be freely used forms the basis of Abraham's observations on parapraxes 'with an overcompensating purpose' (Abraham, 1922*b*). A woman patient was very liable to duplicate the first syllable of proper names by stammering. She changed the name 'Protagoras' to 'Protragoras', shortly after having said 'A-lexander' instead of 'Alexander'. Enquiry revealed that in childhood she had been especially fond of the vulgar joke of repeating the syllables 'a' and 'po' when they occurred at the beginnings of words, a form of amusement which quite commonly leads to stammering in children. ['*A-a*' and '*Popo*' are the German nursery words for 'faeces' and 'buttocks'.] On approaching the name 'Protagoras' she became aware of the risk that she might omit the 'r' in the first syllable and say 'Po-potagoras'. As a protection against this danger she held on firmly to this 'r', and inserted another 'r' in the second syllable. She acted in the same way on other occasions, distorting the words '*Parterre* [ground floor]' and '*Kondolenz* [condolence]' so as to avoid '*Pater* (father)' and '*Kondom* [condom]' which were closely linked to them in her associations. Another of Abraham's patients confessed to an inclination to say 'Angora' every time for 'angina' – very probably because of a fear of being tempted to replace 'angina' with 'vagina'. These slips of the tongue owed their existence therefore to the fact that a defensive trend had retained the upper hand instead of the distorting one; and Abraham justly draws attention to the analogy between this process and the formation of symptoms in obsessional neurosis.

reflect on the cleverness of the Romans in permitting the soldiers of a general who was enjoying a triumph openly to express in the form of satirical songs their inner criticisms of the man who was being honoured. – Meringer relates that he himself once said to someone, who by reason of being the eldest member of the company was addressed familiarly by the honorific title of '*Senexl*'[1] or '*altes* [old] *Senexl*': '*Prost* [Your health!], *Senex altesl!*' He was himself shocked at this mistake (Meringer & Mayer, 1895, 50). We can perhaps interpret his emotion if we reflect how close 'Altesl' comes to the insulting phrase 'alter Esel' ['old ass']. There are powerful internal punishments for any breach of the respect due to age (that is, reduced to childhood terms, of the respect due to the father).

I hope that readers will not overlook the difference in value between these interpretations [*Deutungen*], of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies *outside* the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no-one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no-one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name [p. 9 above], and to our surprise at the tenacity of an apparently indifferent memory [p. 39 f.]; and it invariably indicates that some motive has contributed to the occurrence of the interference.

The twisting round of a name when it is intentional amounts to an insult; and it might well have the same significance in a whole number of
[84] cases where it appears in the form of an unintentional slip of the tongue. The person who, as Mayer reports, said 'Freuder' on one occasion instead of 'Freud' because he had shortly before mentioned Breuer's name (Meringer & Mayer, 1895, 38), and who another time spoke of the 'Freuer-Breudian' method of treatment (ibid., 28), was probably a professional colleague – and one who was not particularly enthusiastic about that method. In the chapter below on slips of the pen [*Verschreiben*] I

1 [This is the affectionate Austrian form of diminutive applied to the Latin 'senex', 'old man'.]

shall report an instance of the distortion of a name which certainly cannot be explained in any other way [p. 102].[1]

In these cases the disturbing factor which intervenes is a criticism [85] which has to be set aside since at the moment it does not correspond to the speaker's intention.

Conversely,[2] replacing one name with another, assuming someone else's name, identification by means of a slip over a name, must signify an appreciative feeling which has for some reason to remain in the background for the time being. An experience of this kind from his schooldays is described by Sándor Ferenczi:

'When I was in the first form at the *Gymnasium* [secondary school] I had, for the first time in my life, to recite a poem in public (i.e. in front of the whole class). I was well prepared and was dismayed at being interrupted at the very start by a burst of laughter. The teacher subsequently told me why I had met with this strange reception. I gave the title of the poem "Aus der Ferne [From Afar]" quite correctly, but instead of attributing it to its real author I gave my own name. The poet's name is Alexander (Sándor [in Hungarian]) Petöfi. The exchange of names was helped by our having the same first name; but the real cause

1 [*Footnote added* 1907:] It can in fact be observed that members of the aristocracy in particular are prone to distort the names of the doctors they consult. We may conclude from this that inwardly they despise them, in spite of the courtesy they habitually show them. – [*Added* 1912:] I quote here some pertinent observations on the forgetting of names which come from an account of our subject written in English by Dr Ernest Jones, at that time in Toronto (Jones, 1911*b*, [488]):

'Few people can avoid feeling a twinge of resentment when they find that their name has been forgotten, particularly if it is by someone with whom they had hoped or expected it would be remembered. They instinctively realize that if they had made a greater impression on the person's mind he would certainly have remembered them again, for the name is an integral part of the personality. Similarly, few things are more flattering to most people than to find themselves addressed by name by a great personage where they could hardly have anticipated it. Napoleon, like most leaders of men, was a master of this art. In the midst of the disastrous campaign of France, in 1814, he gave an amazing proof of his memory in this direction. When in a town near Craonne he recollected that he had met the mayor, De Bussy, over twenty years ago in the La Fère regiment; the delighted De Bussy at once threw himself into his service with extraordinary zeal. Conversely there is no surer way of affronting someone than by pretending to forget his name; the insinuation is thus conveyed that the person is so unimportant in our eyes that we cannot be bothered to remember his name. This device is often exploited in literature. In Turgenev's *Smoke* the following passage occurs. "'So you still find Baden entertaining, M'sieu – Litvinov.' Ratmirov always uttered Litvinov's surname with hesitation, every time, as though he had forgotten it, and could not at once recall it. In this way, as well as by the lofty flourish of his hat in saluting him, he meant to insult his pride." The same author in his *Fathers and Sons* writes: "The Governor invited Kirsanov and Bazarov to his ball, and within a few minutes invited them a second time, regarding them as brothers, and calling them Kisarov." Here the forgetting that he had spoken to them, the mistake in the names, and the inability to distinguish between the two young men, constitute a culmination of disparagement. Falsification of a name has the same significance as forgetting it; it is only a step towards complete amnesia.' [Quoted by Freud in German; here given in the original English.]

2 [The next four paragraphs were added in 1910.]

was undoubtedly the fact that at that time I identified myself in my secret wishes with the celebrated hero-poet. Even consciously my love and admiration for him bordered on idolatry. The whole wretched ambition complex is of course to be found as well behind this parapraxis.'

A similar identification by means of an exchange of names was reported to me by a young doctor. He had timidly and reverently introduced himself to the famous Virchow[1] as 'Dr Virchow'. The professor turned to him in surprise and asked: 'Ah! is your name Virchow too?' I do not know how the ambitious young man justified the slip of the tongue he had made – whether he relied upon the flattering excuse that he felt himself so small beside the great name that his own could not fail to slip away from him, or whether he had the courage to admit that he hoped one day to become as great a man as Virchow, and to beg the professor not to treat him so contemptuously on that account. One of these two
[86] thoughts – or perhaps both of them simultaneously – may have confused the young man while he was introducing himself.

From motives of an extremely personal nature I must leave it open whether a similar interpretation is applicable to the following case as well. At the International Congress at Amsterdam in 1907 my theory of hysteria was the subject of lively discussion.[2] In a diatribe against me one of my most vigorous opponents repeatedly made slips of the tongue which took the form of putting himself in my place and speaking in my name. For example, he said: 'It is well known that Breuer and *I* have proved . . .' where he could only have meant '. . . Breuer and *Freud* . . .' My opponent's name bears not the least resemblance to my own. This example, together with many other cases where a slip of the tongue results in one name replacing another, may serve to remind us that such slips can entirely dispense with the assistance afforded by similarity in sound [cf. p. 70 f. above] and can come about with no more support than is provided by hidden factors in the subject matter.

In other, far more significant, cases[3] it is self-criticism, internal opposition to one's own utterance, that obliges one to make a slip of the tongue and even to substitute the opposite of what one had intended. One then observes in astonishment how the wording of an assertion cancels out its

1 [The celebrated pathologist (1821–1902).]

2 [The First International Congress of Psychiatry and Neurology, Amsterdam, September, 1907. The 'opponent' was Aschaffenburg. See Jones (1955, 126).]

3 [The first part of this paragraph, down to the words 'mode of mimetic expression', dates back to 1901. The next two and a half sentences were added in 1907, and the final section (beginning: 'Or take the following case') in 1920.]

own intention, and how the slip has exposed an inner insincerity.[1] The slip of the tongue here becomes a mode of mimetic expression – often, indeed, for the expression of something one did not wish to say: it becomes a mode of self-betrayal. This was the case, for instance, when a man who did not care for what is called normal sexual intercourse in his relations with women broke into a conversation about a girl who was said to be a flirt [*Kokett*], with the words: 'If she had to do with me, she'd soon give up her *koëttieren* [a non-existent word].' There is no doubt [87] that it can only have been another word, namely '*koitieren*' [to have coitus], whose influence was responsible for making this change in the word that was intended, '*kokettieren*' [to flirt, coquette]. – Or take the following case: 'We have an uncle who for months past had been very much offended because we never visited him. We took his move to a new house as an occasion for paying him a long overdue visit. He seemed very glad to see us, and as we were leaving he said with much feeling: "I hope from now on I shall see you still *more seldom* than in the past."'

When the linguistic material happens to be favourable,[2] it often causes slips of the tongue to occur which have the positively shattering result of a revelation, or which produce the full comic effect of a joke. – This is the case in the following example observed and reported by Dr Reitler:

'"That smart new hat – I suppose you '*aufgepatzt*' [instead of '*aufgeputzt*' (trimmed)] it yourself?" said one lady in a voice of admiration to another. She could proceed no further with her intended praise; for the criticism she had silently felt that the hat's trimmings ["*Hutaufputz*"] were a "*Patzerei* [botch]" had been indicated much too clearly by the unfriendly slip of the tongue for any further phrases of conventional admiration to sound convincing.'[3]

The criticism contained in the following example[4] is milder but nonetheless unambiguous:

1 Slips of the tongue of this type are used, for instance, by Anzengruber [the Viennese dramatist (1839–89)] in his *Der G'wissenswurm* to expose the character of the hypocritical legacy hunter.

2 [This and the following paragraph were added in 1907.]

3 [Quoted by Freud in Lecture II of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 32. – In the editions of 1910 and 1912 only, the following paragraphs appeared in the text at this point.

'The same is to be found in a case reported by Dr Ferenczi:

'"Come *geschminkt* [painted, i.e. with make-up on]' (instead of '*geschwind* [quickly]'), said one of my [Hungarian] women patients to her German-speaking mother-in-law. By this slip she gave away precisely what she wanted to conceal from her: namely, her irritation at the old lady's vanity."

'It is by no means rare for someone who is not speaking his mother tongue to exploit his clumsiness for the purpose of making highly significant slips of the tongue in the language that is foreign to him.']

4 [Added in 1920.]

[88] 'A lady who was visiting an acquaintance became very impatient and weary at her tedious and long-winded conversation. When at last she succeeded in tearing herself away and taking her leave she was detained by a fresh deluge of words from her companion, who had meanwhile accompanied her into the front hall and now forced her, as she was on the very point of departing, to stand at the door and listen once more. At last she interrupted her hostess with the question: "Are you at home in the front hall [*Vorzimmer*]?" It was not till she saw the other's astonished face that she noticed her slip of the tongue. Weary of being kept standing so long in the front hall she had meant to break off the conversation by asking: "Are you at home in the mornings [*Vormittag*]?", and her slip betrayed her impatience at the further delay.'

The next example,[1] which was witnessed by Dr Max Graf, is a warning that one should keep a watch on oneself.

'At the general meeting of the "Concordia", the Society of Journalists, a young member who was invariably hard-up made a violently aggressive speech, and in his excitement spoke of the "*Vorschussmitglieder* [lending members]" (instead of "*Vorstandsmitglieder* [officers]" or "*Ausschussmitglieder* [committee members]"). The latter have the authority to sanction loans, and the young speaker had in fact put in an application for a loan.'

We have seen[2] from the example of '*Vorschwein*' [p. 49 above] that a slip of the tongue can easily occur if an effort has been made to suppress insulting words. In this way one gives vent to one's feelings:

A photographer who had made a resolution to refrain from zoological terms in dealing with his clumsy employees, addressed an apprentice – who tried to empty out a large dish that was full to the brim and in doing so naturally spilt half the contents on the floor – in the following words: 'But, man, *schöpsen Sie*[3] some of it off first.' And soon after this, in the course of a tirade against a female assistant who had nearly spoilt
[89] a dozen valuable plates by her carelessness, he said: 'Are you so *hornverbrannt*. . . . ?'[4]

1 [This was added in 1907; it was later quoted by Freud in Lecture III of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 46.]

2 [This and the following paragraph were added in 1920.]

3 [He meant to say 'draw', which would have been '*schöpfen Sie*'. Instead, he used '*schöpsen Sie*', which is meaningless. The word '*Schöps*', however, means 'sheep' or 'silly fellow'.]

4 [Here he meant to say '*hirnverbrannt*', 'idiotic', literally 'with your brain (*Hirn*) burnt up'. The word he used instead, a non-existent term, would mean 'with your horn (*Horn*) burnt up'. The word '*Hornvieh*', literally 'horned cattle', is used in the sense of 'fool'.]

The next example[1] shows how a slip of the tongue resulted in a serious self-betrayal. Certain details in it justify its repetition in full from the account given by Brill in the *Zentralblatt für Psychoanalyse*, Volume II.[2]

'I went for a walk one evening with Dr Frink, and we discussed some of the business of the New York Psychoanalytic Society. We met a colleague, Dr R., whom I had not seen for years and of whose private life I knew nothing. We were very pleased to meet again, and on my invitation he accompanied us to a café, where we spent two hours in lively conversation. He seemed to know some details about me, for after the usual greetings he asked after my small child and told me that he heard about me from time to time from a mutual friend and had been interested in my work ever since he had read about it in the medical press. To my question as to whether he was married he gave a negative answer, and added: "Why should a man like me marry?"

'On leaving the café, he suddenly turned to me and said: "I should like to know what you would do in a case like this: I know a nurse who was named as co-respondent in a divorce case. The wife sued the husband and named her as co-respondent, and *he* got the divorce."[3] I interrupted him, saying: "You mean *she* got the divorce." He immediately corrected himself, saying: "Yes, of course, *she* got the divorce", and continued to tell how the nurse had been so affected by the divorce proceedings and the scandal that she had taken to drink, had become very nervous, and so on; and he wanted me to advise him how to treat her.

'As soon as I had corrected his mistake I asked him to explain it, but I [90] received the usual surprised answers: had not everyone a right to make a slip of the tongue? it was only an accident, there was nothing behind it, and so on. I replied that there must be a reason for every mistake in speaking, and that, had he not told me earlier that he was unmarried, I would be tempted to suppose he himself was the hero of the story; for in that case the slip could be explained by his wish that he had obtained the divorce rather than his wife, so that he should not have (by our matrimonial laws) to pay alimony, and so that he could marry again in New York State. He stoutly denied my conjecture, but the exaggerated emotional reaction which accompanied it, in which he showed marked signs of agitation followed by laughter, only strengthened my suspicions.

1 [Added in 1912.]

2 In the *Zentralblatt* the paper was ascribed in error to Ernest Jones. [The version given here is the one to be found in Brill (1912), slightly modified.]

3 [In the German version of Brill's paper the following footnote appeared at this point:] 'By our laws a divorce cannot be obtained unless it is proved that one party has committed adultery; and in fact the divorce is granted only to the innocent party.'

To my appeal that he should tell the truth in the interests of science, he answered: "Unless you wish me to lie you must believe that I was never married, and hence your psychoanalytic interpretation is all wrong." He added that someone who paid attention to every triviality was positively dangerous. Then he suddenly remembered that he had another appointment and left us.

'Both Dr Frink and I were still convinced that my interpretation of his slip of the tongue was correct, and I decided to corroborate or disprove it by further investigation. Some days later I visited a neighbour, an old friend of Dr R., who was able to confirm my explanation in every particular. The divorce proceedings had taken place some weeks before, and the nurse was cited as co-respondent. Dr R. is today thoroughly convinced of the correctness of the Freudian mechanisms.'

The self-betrayal is equally unmistakable in the following case,[1] reported by Otto Rank:

'A father who was without any patriotic feelings, and who wished to educate his children so that they too should be free from what he regarded as a superfluous sentiment, was criticizing his sons for taking part in a patriotic demonstration; when they protested that their uncle had also taken part in it, he replied: "*He* is the one person you should not imitate: he is an *idiot*." On seeing his children's look of astonishment at their father's unusual tone, he realized that he had made a slip of the tongue, and added apologetically: "I meant to say '*patriot*', of course.'"

[91] Here is a slip of the tongue[2] which was interpreted as a self-betrayal by the other party to the conversation. It is reported by Stärcke, who adds a pertinent comment, though it goes beyond the task of interpreting the slip.

'A woman dentist promised her sister that she would have a look some time to see if there was *Kontakt* [contact] between two of her molars (that is, to see if the lateral surfaces of the molars were touching each other so that no fragments of food could lodge in between). Her sister finally complained about having to wait so long for this inspection, and jokingly said: "She's probably treating a colleague at the moment, but her sister has to go on waiting." The dentist eventually examined her, found there was in fact a small cavity in one of the molars, and said: "I didn't think it was in such a bad way – I thought it was merely that you had no *Kontant* [ready money] – I mean *Kontakt*." "You see?" laughed

1 [Added in 1912.]

2 [This example and the two following ones (i.e. to the top of p. 80) were added in 1917.]

her sister; "your greed is the only reason why you made me wait so much longer than your paying patients!"

'(Obviously I should not add my own associations to hers or base any conclusions on them, but when I heard of this slip of the tongue it at once sprang to my mind that these two pleasant and gifted young ladies are unmarried and have in fact very little to do with young men, and I asked myself whether they would have more *contact* with young people if they had more *ready money*.)' [Cf. J. Stärcke, 1916.]

In the following example, too, reported by Reik (1915*a*), the slip of the tongue amounts to a self-betrayal:

'A girl was to become engaged to a young man whom she did not care for. To bring the two young people closer together, their parents arranged a meeting which was attended by the parties to the intended match. The young girl possessed sufficient self-control to prevent her suitor, who behaved in a very oncoming manner towards her, from detecting her antipathy to him. But when her mother asked her how she liked the young man, she answered politely: "Well enough. He's most *liebenswidrig*!"'[1]

Equally self-revealing is the following, which Rank (1913*b*) describes as [92]
a 'witty slip of the tongue'.

'A married woman, who enjoyed hearing anecdotes and who was said not to be altogether averse to extra-marital affairs if they were reinforced by adequate gifts, was told the following time-honoured story, not without design on his part, by a young man who was eager to obtain her favours. One of two business friends was trying to obtain the favours of his partner's somewhat prudish wife. In the end she consented to grant them to him in exchange for a present of a thousand gulden. When, therefore, her husband was about to start on a journey, his partner borrowed a thousand gulden from him and promised to pay them back next day to his wife. He then, of course, paid the sum to the wife, implying that it was the reward for her favours; and she supposed she had been caught at last when her husband on his return asked for the thousand gulden and thus found insult added to injury. When the young man reached the point in his story at which the seducer says: "I'll *repay* the money to your wife tomorrow", his listener interrupted with the highly revealing words: "Let me see, haven't you *repaid* me that – I'm sorry – I mean *told*[2] me that already?" She could hardly have given a

1 [She intended to say '*liebenswürdig*', 'agreeable' (literally 'worthy of love'). The word she actually used, '*liebenswidrig*', would mean literally 'repelling to love'.]

2 [There is no resemblance between the two German words for 'repaid' and 'told'.]

clearer indication, without actually putting it into words, of her willingness to offer herself on the same terms.'

A good example[1] of this kind of self-betrayal, which did not lead to serious consequences, is reported by Tausk (1917) under the title of 'The Faith of our Fathers'. 'As my fiancée was a Christian', Herr A. related, 'and was unwilling to adopt the Jewish faith, I myself was obliged to be converted from Judaism to Christianity so that we could marry. I did not change my religion without some internal resistance, but I felt it was justified by the purpose behind it, the more so because it involved abandoning no more than an outward adherence to Judaism, not a religious conviction (which I had never had). Notwithstanding this, I always continued later on to acknowledge the fact of my being a Jew, and few of my acquaintances know I am baptized. I have two sons by this
[93] marriage, who were given Christian baptism. When the boys were sufficiently old they were told of their Jewish background, so as to prevent them from being influenced by anti-Semitic views at their school and from turning against their father for such a superfluous reason. Some years ago I and my children, who were then at their primary school, were staying with the family of a teacher at the summer resort in D. One day while we were sitting at tea with our otherwise friendly hosts, the lady of the house, who had no inkling of her summer guests' Jewish ancestry, launched some very sharp attacks on the Jews. I ought to have made a bold declaration of the facts in order to set my sons the example of "having the courage of one's convictions", but I was afraid of the unpleasant exchanges that usually follow an avowal of this sort. Besides, I was alarmed at the possibility of having to leave the good lodgings we had found and of thus spoiling my own and my children's in any case limited holiday period, should our hosts' behaviour towards us take an unfriendly turn because of the fact that we were Jews. As, however, I had reason to expect that my sons, in their candid and ingenuous way, would betray the momentous truth if they heard any more of the conversation, I tried to get them to leave the company by sending them into the garden. I said: "Go into the garden, *Juden* [Jews]", quickly correcting it to "*Jungen* [youngsters]". In this way I enabled the "courage of my convictions" to be expressed in a parapraxis. The others did not in fact draw any conclusions from my slip of the tongue, since they attached no significance to it; but I was obliged to learn the lesson that the "faith of our fathers" cannot be disavowed with impunity if one is a son and has sons of one's own.'

1 [Added in 1919.]

The effect produced by the following slip of the tongue,[1] which I would not report had not the magistrate himself made a note of it for this collection during the court proceedings, is anything but innocent:

A soldier charged with housebreaking stated in evidence: 'Up to now I've not been discharged from military *Diebsstellung*;[2] so at the moment I'm still in the army.'

A slip of the tongue[3] has a more cheering effect during psychoanalytic [94] work, when it serves as a means of providing the doctor with a confirmation that may be very welcome to him if he is engaged in a dispute with the patient. I once had to interpret a patient's dream in which the name 'Jauner' occurred. The dreamer knew someone of that name, but it was impossible to discover the reason for his appearing in the context of the dream; I therefore ventured to suggest that it might be merely because of his name, which sounds like the term of abuse '*Gauner*' [swindler]. My patient hastily and vigorously contested this; but in doing so he made a slip of the tongue which confirmed my guess, since he confused the same letters once more. His answer was: 'That seems to me too *jewagt* [instead of "*gewagt* (far-fetched)"].'[4] When I had drawn his attention to his slip, he accepted my interpretation.

If one of the parties involved in a serious argument makes a slip of the tongue which reverses the meaning of what he intended to say, it immediately puts him at a disadvantage with his opponent, who seldom fails to make the most of his improved position.

This makes it clear[5] that people give slips of the tongue and other parapraxes the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxes. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a *lapsus linguae* and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines

1 [Added in 1920.]

2 [He meant to say '*Dienststellung*', 'service', literally 'service [*Dienst*] position [*Stellung*]'. Instead, he said '*Diebsstellung*', which would mean literally 'thief position'.]

3 [This paragraph and the following one were added in 1907. The 'Jauner' slip was also quoted by Freud in his late paper on 'Constructions in Analysis' (1937*d*), *RSE*, **23**, 240.]

4 [In vulgar speech, particularly in North Germany, 'g' at the beginning of a word is often pronounced like the German 'j' (English 'y') instead of like the hard English 'g'.]

5 [This paragraph and the two following ones were added in 1910.]

in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite
[95] meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that *it would be unfair and unjust to speak of a coterie of responsible advisers round our Emperor . . .*' (loud cries of 'irresponsible') '*. . . irresponsible advisers*. Forgive the *lapsus linguae*.' (Laughter.)

In this case, as a result of the accumulation of negatives, Prince Bülow's sentence was somewhat obscure; sympathy for the speaker and consideration for his difficult position prevented this slip from being put to any further use against him. A year later another speaker in the same place was not so fortunate. He wished to appeal for a demonstration *with no reserves* [*rückhaltlos*] in support of the Emperor, and in doing so was warned by a bad slip of the tongue that other emotions were to be found within his loyal breast. 'Lattmann (German National Party): On the question of the address our position is based on the standing orders of the Reichstag. According to them the Reichstag is entitled to tender such an address to the Emperor. It is our belief that the united thoughts and wishes of the German people are bent on achieving a *united demonstration* in this matter as well, and if we can do so in a form that takes the Emperor's feelings fully into account, then we should do so *spinelessly* ["*rückgratlos*"] as well.' (Loud laughter which continued for some minutes.) 'Gentlemen, I should have said not "*rückgratlos*" but "*rückhaltlos* [unreservedly]"' (laughter), 'and at this difficult time even our Emperor accepts a manifestation by the people – one made without reserve – such as we should like to see.'[1]

The [Social-Democratic paper] *Vorwärts* of November 12, 1908, did not miss the opportunity of pointing to the psychological significance of this slip of the tongue: 'Probably never before in any parliament has a member, through an involuntary self-accusation, characterized his own attitude and that of the parliamentary majority towards the Emperor so exactly as did the anti-Semitic Lattmann, when, speaking with solemn emotion on the second day of the debate, he slipped into an admission that he and his friends wished to express their opinion to the Emperor *spinelessly*. Loud laughter from all sides drowned the remaining words
[96] of this unhappy man, who thought it necessary explicitly to stammer out by way of apology that he really meant "*unreservedly*".'

1 [Freud later alluded to this slip in Lecture IV of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 55.]

I will add a further instance,[1] in which the slip of the tongue assumed the positively uncanny characteristics of a prophecy. Early in 1923 there was a great stir in the world of finance when the very young banker X. – probably one of the newest of the '*nouveaux riches*' in W., and at any rate the richest and youngest – obtained possession, after a short struggle, of a majority of the shares of the —— Bank; and as a further consequence, a remarkable general meeting took place at which the old directors of the bank, financiers of the old type, were not re-elected, and young X. became president of the bank. In the valedictory speech which the managing director Dr Y. went on to deliver in honour of the old president, who had not been re-elected, a number of the audience noticed a distressing slip of the tongue which occurred again and again. He continually spoke of the *expiring* [*dahinscheidend*] president instead of the *outgoing* [*ausscheidend*] president. As it turned out, the old president who was not re-elected died a few days after this meeting. He was, however, over eighty years old! (From Storfer.)

A good example of a slip of the tongue[2] whose purpose is not so much to betray the speaker as to give the listener in the theatre his bearings is to be found in [Schiller's] *Wallenstein* (*Piccolomini*, Act I, Scene 5); and it shows us that the dramatist, who here availed himself of this device, was familiar with the mechanism and meaning of slips of the tongue. In the preceding scene Max Piccolomini has ardently espoused the Duke's [Wallenstein's] cause, and has been passionately describing the blessings of peace, of which he has become aware in the course of a journey while escorting Wallenstein's daughter to the camp. As he leaves the stage, his father [Octavio] and Questenberg, the emissary from the court, are plunged in consternation. Scene 5 continues:

QUESTENBERG Alas, alas! and stands it so?
What friend! and do we let him go away
In this delusion – let him go away?
Not call him back immediately, not open
His eyes upon the spot?
OCTAVIO (*recovering himself out of a deep study*) [97]
He has now open'd mine,
And I see more than pleases me.
QUEST. What is it?
OCT. Curse on this journey!
QUEST. But why so? What is it?

1 [Added in 1924.]
2 [Added in 1907.]

OCT. Come, come along, friend! I must follow up
The ominous track immediately. Mine eyes
Are open'd now, and I must use them. Come!
(*Draws Q. on with him*)
QUEST. What now? *Where* go you then?
OCT. To her herself.
QUEST. To —
OCT. (*correcting himself*) To the Duke. Come let us go.

[Coleridge's translation.]

The small slip of saying 'to her' instead of 'to him' is meant to reveal to us that the father has seen through his son's motive for espousing the Duke's cause, while the courtier complains that he is 'talking absolute riddles' to him.[1]

Another example[2] in which a dramatist makes use of a slip of the tongue has been discovered by Otto Rank (1910*c*) in Shakespeare. I quote Rank's account:

'A slip of the tongue occurs in Shakespeare's *Merchant of Venice* (Act III, Scene 2), which is from the dramatic point of view extremely subtly motivated and which is put to brilliant technical use. Like the slip in *Wallenstein* to which Freud has drawn attention, it shows that dramatists have a clear understanding of the mechanism and meaning of this kind of parapraxis and assume that the same is true of their audience. Portia, who by her father's will has been bound to the choice of a husband by lot, has so far escaped all her unwelcome suitors by a fortunate chance. Having at last found in Bassanio the suitor who is to her liking, she has cause to fear that he too will choose the wrong casket. She would very much like to tell him that even so he could rest assured of her love; but she is prevented by her vow. In this internal conflict the poet makes her say to the suitor she favours:

I pray you tarry; pause a day or two,
Before you hazard: for, in choosing wrong,
[98] I lose your company; therefore, forbear awhile:
There's something tells me (*but it is not love*)
I would not lose you . . .
. . . I could teach you
How to choose right, but then I am forsworn;
So will I never be; so may you miss me;

1 [Octavio realizes that his son's motive springs from love of the Duke's daughter. – This example and the next were quoted by Freud in Lecture II of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 33–5.]

2 [Added in 1912.]

> But if you do you'll make me wish a sin,
> That I have been forsworn. Beshrew your eyes,
> They have o'erlooked me, and divided me;
> *One half of me is yours*, *the other half yours*, –
> *Mine own*, *I would say*; but if mine, then yours,
> And so all yours.

'The thing of which she wanted to give him only a very subtle hint, because she should really have concealed it from him altogether, namely, that even before he made his choice she was *wholly* his and loved him – it is precisely this that the poet, with a wonderful psychological sensitivity, causes to break through openly in her slip of the tongue; and by this artistic device he succeeds in relieving both the lover's unbearable uncertainty and the suspense of the sympathetic audience over the outcome of his choice.'[1]

In view of the interest that is lent to our theory of slips of the tongue by support of this nature from great writers, I feel justified in citing a third such instance which has been reported by Ernest Jones[2] (1911*b*, 496):

'In a recently published article Otto Rank drew our attention to a pretty instance of how Shakespeare caused one of his characters, Portia, to make a slip of the tongue which revealed her secret thoughts to an attentive member of the audience. I propose to relate a similar example from *The Egoist*, the masterpiece of the greatest English novelist, George Meredith. The plot of the novel is, shortly, as follows: Sir Willoughby Patterne, an aristocrat greatly admired by his circle, becomes engaged to a Miss Constantia Durham. She discovers in him an intense egoism, which he skilfully conceals from the world, and to escape the marriage she elopes with a Captain Oxford. Some years later Patterne [99]
becomes engaged to a Miss Clara Middleton, and most of the book is taken up with a detailed description of the conflict that arises in her mind on also discovering his egoism. External circumstances, and her conception of honour, hold her to her pledge, while he becomes more and more distasteful in her eyes. She partly confides in his cousin and secretary, Vernon Whitford, the man whom she ultimately marries; but from loyalty to Patterne and other motives he stands aloof.

'In a soliloquy about her sorrow Clara speaks as follows: "'If some noble gentleman could see me as I am and not disdain to aid me! Oh! to

1 [In reproducing this in Lecture II of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 34–5, Freud added a further comment of his own.]

2 [This example – also added in 1912 – appears in Freud's book in a German translation. We here give the original English.]

be caught out of this prison of thorns and brambles. I cannot tear my own way out. I am a coward. A beckoning of a finger[1] would change me, I believe. I could fly bleeding and through hootings to a comrade . . . Constantia met a soldier. Perhaps she prayed and her prayer was answered. She did ill. But, oh, how I love her for it! His name was Harry Oxford . . . She did not waver, she cut the links, she signed herself over. Oh, brave girl, what do you think of me? But I have no Harry Whitford; I am alone . . .' The sudden consciousness that she had put another name for Oxford struck her a buffet, drowning her in crimson."

'The fact that both men's names end in "ford" evidently renders the confounding of them more easy, and would by many be regarded as an adequate cause for this, but the real underlying motive for it is plainly indicated by the author. In another passage the same *lapsus* occurs, and is followed by the spontaneous hesitation and sudden change of subject that one is familiar with in psycho-analysis and in Jung's association experiments when a half-conscious complex is touched. Sir Willoughby patronisingly says of Whitford: "'False alarm. The resolution to do anything unaccustomed is quite beyond poor old Vernon.'" Clara replies: "'But if Mr Oxford – Whitford . . . your swans, coming sailing up the lake, how beautiful they look when they are indignant! I was going to
[100] ask you, surely men witnessing a marked admiration for someone else will naturally be discouraged?' Sir Willoughby stiffened with sudden enlightenment."

'In still another passage, Clara by another *lapsus* betrays her secret wish that she was on a more intimate footing with Vernon Whitford. Speaking to a boy friend, she says: "'Tell Mr Vernon – tell Mr Whitford.'"'[2]

The view[3] of slips of the tongue which is advocated here can meet the test even in the most trivial examples. I have repeatedly been able to show that the most insignificant and obvious errors in speaking have their meaning and can be explained in the same way as the more striking instances. A woman patient who was acting entirely against my wishes in planning a short trip to Budapest, but who was determined to have her

1 Note by the [German] translator [J. Theodor von Kalmár]: I had originally proposed to translate the English words 'beckoning of a finger' by '*leiser Wink*' ['slight hint'] till I realized that by suppressing the word 'finger' I was robbing the sentence of a psychological subtlety.

2 [*Footnote added* 1920:] Other instances of slips of the tongue which the writer intends to be taken as having a meaning and usually as being self-revealing can be found in Shakespeare's *Richard II* (Act II, Scene 2), and in Schiller's *Don Carlos* (Act II, Scene 8; a slip made by Princess Eboli). There would doubtless be no difficulty in extending this list.

3 [This paragraph was added in 1907; the one which follows dates back to 1901.]

own way, justified herself by telling me that she was going for only three days; but she made a slip of the tongue and actually said 'only three *weeks*'. She was betraying the fact that, to spite me, she would rather spend three weeks than three days there in the company which I considered unsuitable for her. – One evening I wanted to excuse myself for not having fetched my wife home from the theatre, and said: 'I was at the theatre at ten past ten.' I was corrected: 'You mean ten *to* ten.' Of course I meant ten *to* ten. *After* ten o'clock would have been no excuse. I had been told that the theatre bills said the performance ended before ten. When I reached the theatre I found the entrance hall in darkness and the theatre empty. The performance had in fact ended earlier and my wife had not waited for me. When I looked at the clock it was only five to ten. But I decided to make my case out more favourable when I got home and to say it had been ten to ten. Unfortunately, my slip of the tongue spoilt my plan and revealed my disingenuousness, by making me confess more than there was to confess.

This leads on to those speech disturbances which cannot any longer be [101]
described as slips of the tongue because what they affect is not the individual word but the rhythm and execution of a whole speech: disturbances like, for instance, stammering and stuttering caused by embarrassment. But here too, as in the former cases, it is a question of an internal conflict, which is betrayed to us by the disturbance in speech. I really do not think that anyone would make a slip of the tongue in an audience with his sovereign, in a serious declaration of love or in defending his honour and name before a jury – in short, on all those occasions in which a person is heart and soul engaged. Even in forming an appreciation of an author's style we are permitted and accustomed to apply the same elucidatory principle which we cannot dispense with in tracing the origins of individual mistakes in speech. A clear and unambiguous manner of writing shows us that here the author is at one with himself; where we find a forced and involved expression which (to use an apt phrase) is aimed at more than one target, we may recognize the intervention of an insufficiently worked-out, complicating thought, or we may hear the stifled voice of the author's self-criticism.[1]

1 [*Footnote added* 1910:] Ce que l'on conçoit bien s'énonce clairement
Et les mots pour le dire arrivent aisément.

[What is well thought out presents itself with clarity,
And the words to express it come easily.]
Boileau: *Art poétique*.

[The editors of the *Oeuvres complètes de Freud* point out that the above lines from Boileau were slightly misquoted in all previous German and English editions. – In a letter to Fliess of September 21, 1899 (Freud, 1950*a*, Letter 119) Freud applied a criticism of this precise kind to what he felt was his own unsatisfactory style in *The Interpretation of Dreams* (1900*a*). The passage can be found quoted in *RSE*, **4**, xxi–xxii.]

Since this book first appeared[1] friends and colleagues who speak other languages have begun to turn their attention to slips of the tongue which they have been able to observe in countries where their language is spoken. As was to be expected they have found that the laws governing parapraxes are independent of the linguistic material; and they have
[102] made the same interpretations that have been exemplified here in instances coming from speakers of the German language. Of countless examples I include only one:

Brill (1909) reports of himself: 'A friend described to me a nervous patient and wished to know whether I could benefit him. I remarked: "I believe that in time I could remove all his symptoms by psycho-analysis because it is a *durable* case" – wishing to say "*curable*"!'[2]

In conclusion,[3] for the benefit of readers who are prepared to make a certain effort and to whom psychoanalysis is not unfamiliar, I will add an example which will enable them to form some picture of the mental depths into which the pursuit even of a slip of the tongue can lead. It has been reported by Jekels (1913*a*).

'On December 11, a lady of my acquaintance addressed me (in Polish) in a somewhat challenging and overbearing manner, as follows: "Why did I say today that I have twelve fingers?" At my request she gave an account of the scene in which the remark was made. She had got ready to go out with her daughter to pay a visit, and had asked her daughter – a case of dementia praecox then in remission – to change her blouse; and this she in fact did, in the adjoining room. On re-entering, the daughter found her mother busy cleaning her nails, and the following conversation ensued:

'Daughter: "There! I'm ready now and you're not!"

'Mother: "Yes, but you have only one blouse and I have *twelve nails*."

'Daughter: "What?"

[103] 'Mother (impatiently): "Well, of course I have; after all, I have *twelve fingers*."

1 [This paragraph and the example that follows were added in 1912.]

2 [This example is given in English in the original. – In the 1912 edition only, the following passage appeared in the text at this point: 'An extremely instructive instance of the way in which a simple slip of the tongue may be made use of in a psychoanalysis has been reported by Stekel (1910):

'"A patient suffering from agoraphobia said during the analysis: 'If I start on a subject I keep "*dablei*" [for "*dabei*", "at it"] with some obstinacy.' When his attention had been drawn to his slip, he went on: 'I have done what children do and said "l" instead of "r" – "blei" instead of "brei"', so making a second slip of the tongue.

'"This slip was obviously of great significance. The syllables 'bei – brei – blei' [in German: 'at', 'broth', 'lead'] carried important associations."']

3 [The rest of the chapter was added in 1917.]

'A colleague who heard the story at the same time as I did asked what occurred to her in connection with *twelve*. She answered equally quickly and definitely: "Twelve means nothing to me – it is not the date of anything (of importance)."

'To *finger* she gave the following association after a little hesitation: "Some of my husband's family were born with six fingers on their feet (Polish has no specific word for 'toe'). When our children were born they were immediately examined to see if they had six fingers." For external reasons the analysis was not continued that evening.

'Next morning, December 12, the lady visited me and told me with visible excitement: "What do you suppose has happened? For about the last twenty years I have been sending congratulations to my husband's elderly uncle on his birthday, which is today, and I have always written a letter on the 11th. This time I forgot about it and had to send a telegram just now."

'I myself remembered, and I reminded the lady, how positive she had been the evening before in dismissing my colleague's question about the number twelve – which was in fact very well fitted to remind her of the birthday – by remarking that the twelfth was not a date of importance to her.

'She then admitted that this uncle of her husband's was a wealthy man from whom she had in fact always expected to inherit something, quite especially in her present straitened financial circumstances. Thus, for instance, it was he, or rather his death, that had immediately sprung to her mind a few days before when an acquaintance of hers had predicted from cards that she would receive a large sum of money. It flashed through her mind at once that the uncle was the only person from whom money could possibly come to her or her children; and this same scene also instantly reminded her of the fact that this uncle's wife had once promised to remember the lady's children in her will. But in the meanwhile she had died intestate; had she perhaps given her husband appropriate instructions?

'The death wish against the uncle must clearly have emerged with very great intensity, for she said to the friend who made the prophecy: "You [104] encourage people to make away with others." In the four or five days that elapsed between the prophecy and the uncle's birthday she was constantly looking at the obituary columns in the newspapers from the town where the uncle lived. Not surprisingly, therefore, in view of the intensity of her wish for his death, the event and the date of the birthday he was about to celebrate were so strongly suppressed that not only was a resolution which had been carried out for years forgotten in

consequence, but even my colleague's question failed to bring them to consciousness.

'In the slip "twelve fingers" the suppressed "twelve" had broken through and had helped to determine the parapraxis. I say "*helped* to determine", for the striking association to "finger" leads us to suspect the existence of some further motivations. It also explains why the "twelve" had falsified precisely this most innocent phrase, "ten fingers". The association ran: "Some members of my husband's family were born with six fingers on their feet." Six toes are a sign of a particular abnormality. Thus six fingers mean *one* abnormal child and twelve fingers *two* abnormal children. And that was really the fact in this case. The lady had married at a very early age; and the only legacy left her by her husband, a highly eccentric and abnormal person who took his own life shortly after their marriage, were two children whom the doctors repeatedly pronounced to be abnormal and victims of a grave hereditary taint derived from their father. The elder daughter recently returned home after a severe catatonic attack; soon afterwards, the younger daughter, now at the age of puberty, also fell ill from a serious neurosis.

'The fact that the children's abnormality is here linked with the death wish against the uncle, and is condensed with this far more strongly suppressed and psychically more powerful element, enables us to assume the existence of a second determinant for the slip of the tongue, namely a *death wish against the abnormal children*.

'But the special significance of twelve as a death wish is already indicated by the fact that the uncle's birthday was very intimately associated in the lady's mind with the idea of his death. For her husband had taken his life on the 13th – one day, that is, after the uncle's birthday; and the
[105] uncle's wife had said to the young widow: "Yesterday he was sending his congratulations, so full of warmth and kindness – and today . . . !"

'I may add that the lady had real enough reasons as well for wishing her children dead; for they brought her no pleasure at all, only grief and severe restrictions on her independence, and she had for their sake renounced all the happiness that love might have brought her. On this occasion she had in fact gone to exceptional lengths to avoid putting the daughter with whom she was going to pay the visit in a bad mood; and it may be imagined what demands this makes on anyone's patience and self-denial where the case is one of dementia praecox, and how many angry impulses have to be suppressed in the process.

'The meaning of the parapraxis would accordingly be:

'"The uncle shall die, these abnormal children shall die (the whole of this abnormal family, as it were), and I will get their money."

'This parapraxis bears, in my view, several indications of an unusual structure:

'(*a*) Two determinants were present in it, condensed in a single element.

'(*b*) The presence of the two determinants was reflected in the doubling of the slip of the tongue (twelve nails, twelve fingers).

'(c) It is a striking point that one of the meanings of "twelve", viz. the twelve fingers which expressed the children's abnormality, stood for an indirect form of representation; the psychical abnormality was here represented by the physical abnormality, and the highest part of the body by the lowest.'

VI
MISREADINGS AND SLIPS OF THE PEN[1]

[106] When we come to mistakes in reading and writing, we find that our general approach and our observations in regard to mistakes in speaking hold good here too – not surprisingly, in view of the close kinship between these two functions. I shall confine myself here to reporting a few carefully analysed examples, and shall make no attempt to cover every aspect of the phenomena.

(A) Misreadings

(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* [an illustrated weekly] (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: 'A Wedding Celebration in the *Odyssee* [Odyssey].' It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: 'A Wedding Celebration on the *Ostsee* [Baltic].' How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome*[2] . . ., which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called 'Analysis and Principles of Dream Phenomena'. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest. In
[107] Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also

1 ['*Verlesen und Verschreiben*.' The earlier portion of this chapter, up to p. 95, dates back to 1901.]

2 ['Experimental investigations of music phantoms.' These 'music phantoms' are, according to Ruths, a 'group of psychical phenomena which make an [involuntary] appearance in the brains of many people while they are listening to music'.]

realized that the scene in which Odysseus appears before Nausicaä was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der grüne Heinrich* which explains this episode in the *Odyssey* as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.[1] I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority.

(2) How did I come to read in a newspaper one day: '*Im Fass* [in a tub] across Europe', instead of '*Zu Fuss* [on foot]'? Solving this problem caused me prolonged difficulties. The first associations [*Einfälle*], it is true, indicated that it must have been the tub of Diogenes that I had in mind; and I had recently been reading about the art of the age of Alexander in a history of art. From there it was easy to recall Alexander's celebrated remark: 'If I were not Alexander I should like to be Diogenes.' I also had some dim recollection of a certain Hermann Zeitung[2] who had set out on his travels packed in a trunk. But the train of associations declined to run on further, and I did not succeed in rediscovering the page in the history of art on which the remark had caught my eye. It was not till months later that the problem, which I had meanwhile set aside, suddenly sprang to my mind once more; and this time it brought its solution with it. I recalled the comment of a newspaper article on the strange means of *transport* [*Beförderung*] that people were then choosing in order to go to Paris for the International Exhibition [of 1900]; and the passage, I believe, went on with a joking account of how one gentleman intended to get himself rolled in a tub to Paris by another gentleman. Needless to say, the only motive of these people would be to draw attention to themselves by such folly. Hermann Zeitung was in fact the name [108]
of the man who had provided the first instance of such extraordinary methods of transport. It then struck me that I once treated a patient whose pathological anxiety about reading newspapers was to be explained as a reaction against his pathological *ambition* to see himself in print and to read of his fame in the newspapers. Alexander of Macedon was undoubtedly one of the most ambitious men that ever lived. He even complained that he would find no Homer to sing of his exploits. But how could I possibly have *failed to recall* that there is another Alexander who is closer to me, that Alexander is the name of my younger

1 *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 218–19.

2 ['*Zeitung*', here a proper name, is also the German for 'newspaper'.]

brother?[1] I now immediately found the objectionable thought about this other Alexander that had had to be repressed, and what it was that had given rise to it at the present time. My brother is an authority on matters connected with tariffs and *transport*, and at a certain date he was due to receive the title of professor for his work in teaching at a commercial college. Several years ago my own name had been suggested at the university for the same *promotion* [*Beförderung*], without my having obtained it.[2] At the time, our mother expressed her surprise that her younger son was to become a professor before her elder. This had been the situation when I was unable to solve my mistake in reading. Subsequently my brother too met with difficulties; his prospects of becoming professor sank even lower than my own. But at that point the meaning of the misreading suddenly became clear to me; it was as though the fading of my brother's prospects had removed an obstacle. I had behaved as if I was reading of my brother's appointment in the newspaper and was saying to myself: 'How curious that a person can appear in the newspaper (i.e. can be appointed professor) on account of such stupidities (which is what his profession amounts to)!' Afterwards I had no difficulty in finding the passage about Hellenistic art in the age of Alexander, and to my [109] astonishment convinced myself that in my previous search I had repeatedly read parts of the same page and had each time passed over the relevant sentence as if I was under the dominance of a negative hallucination. However, this sentence did not contain anything at all to enlighten me – anything that would have deserved to be forgotten. I suspect that the symptom consisting of my failure to find the passage in the book was only formed with the purpose of leading me astray. I was intended to search for a continuation of the train of thought in the place where my enquiries encountered an obstacle – that is, in some idea connected with Alexander of Macedon; in this way I was to be more effectively diverted from my brother of the same name. In fact, the device was entirely successful; all my efforts were directed towards rediscovering the lost passage in the history of art.

1 [According to Ernest Jones (1953, 21), the name 'Alexander' had been chosen at Freud's own suggestion – his brother was ten years younger than him – and on the specific ground of Alexander the Great's military prowess and generosity.]

2 [This question is repeatedly discussed in connection with Freud's dreams in *The Interpretation of Dreams* (1900*a*). See, for instance, *RSE*, **4**, 121 ff. He received the appointment ultimately, in 1902, the year following the first publication of this paragraph.]

In this case the ambiguity of the word '*Beförderung*' ['transport' and 'promotion'] forms the associative bridge between the two complexes,[1] the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

(3) One day I received a letter from the neighbourhood of Vienna which brought me a piece of news that shocked me. I immediately called my wife and broke the news to her that '*die* arme [the poor][2] Wilhelm M.' had fallen very seriously ill and been given up by the doctors. There must, however, have been a false ring about the words I chose to express my sorrow, for my wife grew suspicious, asked to see the letter and [110]
declared she was certain it could not read as I had said it did, since no-one called a wife by her husband's first name, and in any case the lady who wrote the letter knew the wife's first name perfectly well. I obstinately defended my assertion and referred to the very common use of visiting cards on which a woman styles herself by her husband's first name. I was finally compelled to pick up the letter, and what we in fact read in it was '*der*[3] arme W. M.', or rather something even plainer: 'der arme *Dr* W. M.', which I had entirely overlooked. My mistake in reading therefore amounted to a kind of convulsive attempt to shift the sad news from the husband to the wife. The title that stood between the article, adjective and name did not fit in well with my requirement that the wife should be the one referred to. For this reason it was simply done away with in the process of reading. My motive for falsifying the message was not, however, that my feelings for the wife were less warm than those I had for her husband, but that the poor man's fate had excited my fears for another person in close contact with me. This person shared with him what I knew to be one of the determinants of the illness.

1 [In 1901 and 1904: 'circles of thoughts'. The word 'complexes' replacing this in the 1907 edition marks the beginning of Jung's influence on Freud. – For the similar use of verbal bridges in the construction of dreams, jokes and neurotic symptoms see *RSE*, **5**, 305 *n*. 1. See also p. 235 *n*. 2 below.]

2 [The use of '*die*', the feminine form of the definite article, implied that the person concerned was a woman.]

3 [The masculine form of the definite article.]

(4)[1] There is one misreading which I find irritating and laughable and to which I am prone whenever I walk through the streets of a strange town on my holidays. On these occasions I read every shop sign that resembles the word in any way as 'Antiquities'. This betrays the questing spirit of the collector.

(5)[2] Bleuler relates in his important book *Affektivität, Suggestibilität, Paranoia* (1906*a*, 121): 'Once while I was reading I had an intellectual feeling that I saw my name two lines further down. To my astonishment I only found the word "*Blutkörperchen* [blood corpuscles]". I have analysed many thousands of misreadings in the peripheral as well as the central visual field; but this is the grossest instance. Whenever I imagined I saw my name, the word that gave rise to the notion usually resembled my name much more, and in most cases every single letter of my name had to be found close together before I could make such an error. In this case, however, the delusion of reference and the illusion
[111] could be explained very easily: what I had just read was the end of a comment on a type of bad style found in scientific works, from which I did not feel free.'

(6)[3] Hanns Sachs reports having read: 'The things that strike other people are passed over by him in his "*Steifleinenheit* [pedantry]".' 'This last word', Sachs proceeds, 'surprised me, and on looking more closely I discovered that it was "*Stilfeinheit* [elegance of style]". The passage occurred in the course of some remarks by an author whom I admired, which were in extravagant praise of a historian whom I do not find sympathetic because he exhibits the "German professorial manner" in too marked a degree.'

(7)[4] Dr Marcell Eibenschütz (1911) describes an instance of misreading in the course of his philological studies. 'I was engaged in studying the literary tradition of the *Book of Martyrs*, a Middle High German legendary which I had undertaken to edit in the series of "German Mediaeval Texts" published by the Prussian Akademie der Wissenschaften. Very little was known about the work, which had never seen print. There was a single essay on it in existence, by Joseph Haupt (1872, 101 ff.). Haupt based his work not on an old manuscript but on a copy of the principal source, Manuscript C (Klosterneuburg). This copy had been made at a comparatively recent date (in the nineteenth

1 [Added 1907.]
2 [Added 1910.]
3 [Added 1919.]
4 [Added 1912.]

century). It is preserved in the Hofbibliothek [Imperial Library]. At the end of the copy the following subscription[1] is to be found:

'"Anno Domini MDCCCL in vigilia exaltacionis sancte crucis ceptus est iste liber et in vigilia pasce anni subsequentis finitus cum adiutorio omnipotentis per me Hartmanum de Krasna tunc temporis ecclesie niwenburgensis custodem."[2]

'Now in his essay Haupt quotes this subscription in the belief that it comes from the writer of C himself, and supposes C to have been written in 1350 – a view involving a consistent misreading of the date 1850 in Roman numerals – in spite of his having copied the subscription perfectly correctly and in spite of its having been printed perfectly correctly (i.e. as MDCCCL) in the essay, in the passage referred to. [112]

'Haupt's information proved the source of much embarrassment to me. In the first place, being an entire novice in the world of scholarship, I was completely dominated by Haupt's authority, and for a long time I read the date given in the subscription lying in front of me – which was perfectly clearly and correctly printed – as 1350 instead of 1850, just as Haupt had done. I did this even though no trace of any subscription could be found in the original Manuscript C, which I used, and though it further transpired that no monk by the name of Hartman had lived at Klosterneuburg at any time in the fourteenth century. And when at last the veil fell from before my eyes I guessed what had happened; and further investigation confirmed my suspicion. The subscription so often referred to is in fact to be found *only* in the copy used by Haupt, and is the work of its copyist, P. Hartman Zeibig, who was born at Krasna in Moravia, was Master of the Augustinian choir at Klosterneuburg, and who as sacrist of the monastery made a copy of Manuscript C and appended his name in the ancient fashion at the end of his copy. The mediaeval phraseology and the old orthography of the subscription doubtless played their part in inducing Haupt always to read 1350 instead of 1850, alongside his *wish* to be able to tell his readers as much as possible about the work he was discussing, and therefore also *to date Manuscript C*. (This was the motive for the parapraxis.)'

(8)[3] In Lichtenberg's *Witzige und satirische Einfälle* [1853] a remark occurs which is no doubt derived from a piece of observation and which comprises virtually the whole theory of misreading: 'He had read

1 [I.e. signature or explanatory paragraph at the end of a document.]

2 ['This book was begun on the Eve of Holy Cross Day in the Year of Our Lord 1850, and was finished on Easter Sunday in the following year; it was made, with the aid of the Almighty, by me, Hartman of Krasna, at that time sacrist of Klosterneuburg.']

3 [Added 1910.]

Homer so much that he always read "*Agamemnon*" instead of "*angenommen* [supposed]".'[1]

For in a very large number of cases[2] it is the reader's preparedness that
[113] alters the text and reads into it something which he is expecting or with which he is occupied. The only contribution towards a misreading which the text itself need make is that of affording some sort of resemblance in the verbal image, which the reader can alter in the sense he requires. Merely glancing at the text, especially with uncorrected vision, undoubtedly increases the possibility of such an illusion, but it is certainly not a necessary precondition for it.

(9) I have an impression that no parapraxis was so greatly encouraged by war conditions – which brought us all such constant and protracted preoccupations – as this particular one of misreading. I have been able to observe a large number of instances of it, but unfortunately I have kept records of only a few of them. One day I picked up a midday or evening paper and saw in large print: '*Der Friede von Görz* [The Peace of Gorizia].' But no, all it said was: '*Die Feinde vor Görz* [The Enemy before Gorizia].' It is easy for someone who has two sons fighting at this very time in that theatre of operations to make such a mistake in reading. – Someone else found an 'old *Brotkarte* [bread card]' mentioned in a certain context; when he looked at this more attentively, he had to replace it with 'old *Brokate* [brocades]'. It is perhaps worth mentioning that at a particular house, where this man is often a welcome guest, it is his habit to make himself agreeable to the mistress by handing his bread cards over to her. – An engineer, whose equipment had never stood up for long to the dampness in a tunnel that was under construction, was astonished to read a laudatory advertisement of goods made of '*Schundleder* [shoddy leather]'. But tradesmen are not usually so candid; what was being recommended was '*Seehundleder* [sealskin]'.

The reader's profession or present situation, too, determines the outcome of his misreading. A philologist, whose most recent, and excellent, works had brought him into conflict with his professional colleagues, read '*Sprachstrategie* [language strategy]' in mistake for '*Schachstrategie* [chess strategy]'. – A man who was taking a walk in a strange town just when the action of his bowels was timed to occur by a course of medical treatment read the word 'Closet House' on a large sign on the first storey of a tall shop building. His satisfaction on seeing it was mixed with a

1 [Also quoted by Freud in his book on *Jokes* (1905*c*), *RSE*, **8**, 82, and in Lecture II of his *Introductory Lectures* (1916–17*a*), ibid., **15**, 35 and 62.]

2 [This paragraph and Examples 9 and 10 were added in 1917.]

certain surprise that the obliging establishment should be in such an unusual place. The next moment, however, his satisfaction vanished; a more correct reading of the words on the sign was 'Corset House'.[1] [114]

(10) In a second group of cases the part which the text contributes to the misreading is a much larger one. It contains something which rouses the reader's defences – some information or imputation distressing to him – and which is therefore corrected by being misread so as to fit in with a repudiation or with the fulfilment of a wish. In such cases we are of course obliged to assume that the text was first correctly understood and judged by the reader before it underwent correction, although his consciousness learnt nothing of this first reading. Example (3) above [p. 95] is of this kind; and I include here a further, highly topical one given by Eitingon (1915), who was at the military hospital at Igló at the time.

'Lieutenant X., who is in our hospital suffering from a traumatic war neurosis, was one day reading me a poem by the poet Walter Heymann, who fell in battle at so early an age. With visible emotion he read the last lines of the final stanza as follows.

> Wo aber steht's geschrieben, frag' ich, dass von allen
> Ich übrig bleiben soll, ein andrer für mich fallen?
> Wer immer von euch fällt, der stirbt gewiss für mich;
> Und ich soll übrig bleiben? *warum denn nicht*?[2]
>
> [But where is it decreed, I ask, that out of all
> I should alone be left, my fellow for me fall?
> Whoever of you falls, for me that man doth die;
> And I – am I alone to live? *Why should not I*?]

'My surprise caught his attention, and in some confusion he read the line correctly:

> Und ich soll übrig bleiben? warum denn *ich*?
>
> [And I – am I alone to live then? Why should *I*?]

'I owe to Case X. some analytic insight into the psychical material of these "traumatic war neuroses", and in spite of the circumstances prevailing in a war hospital with a large number of patients and only a few doctors – circumstances so unfavourable to our way of working – it was [115]

1 [First quoted by Freud in Lecture IV of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 62.]

2 From 'Den Ausziehenden' ['To Those who are Going Forth'] in *Kriegsgedichte und Feldpostbriefe* [War Poems and Letters from the Front] by Walter Heymann.

then possible for me to see a little way beyond the shell explosions which were so highly esteemed as the "cause" of the illness.

'In this case, too, were to be seen the severe tremors which give pronounced cases of these neuroses a similarity that is so striking at the first glance, as well as apprehensiveness, tearfulness, and a proneness to fits of rage, accompanied by convulsive infantile motor manifestations, and to vomiting ("at the least excitement").

'The psychogenic nature of this last symptom in particular – above all in its contribution to the secondary gain from the illness – must have impressed everyone. The appearance in the ward of the hospital commandant who from time to time inspected the convalescent cases, or a remark made by an acquaintance in the street – "You look in really excellent form, you're certainly fit now" – is enough to produce an immediate attack of vomiting.

'"Fit . . . go back to service . . . why should I?"'

(11)[1] Dr Hanns Sachs (1917) has reported some other cases of 'war' misreading:

'A close acquaintance of mine had repeatedly declared to me that when his turn came to be called up he would not make any use of his specialist qualifications, which were attested by a diploma; he would waive any claim based on them for being found suitable employment behind the lines and he would enlist for service at the front. Shortly before the call-up date in fact arrived, he told me one day in the curtest way, and without giving any further reason, that he had submitted the evidence of his specialist training to the proper authorities and as a result would shortly be assigned to a post in industry. Next day we happened to meet in a post office. I was standing up at a desk and writing; he came in, looked over my shoulder for a while and then said: "Oh! the word at the top there's '*Druckbogen* [printer's proofs]' – I'd read it as '*Drückeberger* [shirker]'."'

(12) 'I was sitting in a tram and reflecting on the fact that many of the friends of my youth who had always been taken as frail and weakly were
[116] now able to endure the most severe hardships – ones which would quite certainly be too much for me. While in the middle of this disagreeable train of thought, I read, only half-attentively, a word in large black letters on a shop sign that we were passing: "Iron Constitution". A moment later it struck me that this word was an inappropriate one to be found on the board of a business firm; I turned round hastily and catching another glimpse of the sign saw that it really read: "Iron Construction".' (Sachs, ibid.)

1 [The remainder of this section (Examples 11–13) was added in 1919.]

(13) 'The evening papers carried a Reuter message, which subsequently proved to be incorrect, to the effect that Hughes had been elected President of the United States. This was followed by a short account of the supposed President's career, in which I came across the information that Hughes had completed his studies at *Bonn* University. It struck me as strange that this fact had received no mention in the newspaper discussions during all the weeks before the day of the election. On taking a second look I found that all the text in fact contained was a reference to *Brown* University [at Providence, Rhode Island, USA]. The explanation of this gross case, in which the misreading had called for a fairly violent twist, depended – apart from my haste in reading the newspaper – chiefly upon my thinking it desirable that the new President's sympathy for the Central European Powers, as the basis for good relations in the future, should be based on personal motives as well as political ones.' (Sachs, ibid.)

(*B*) *Slips of the Pen*

(1)[1] On a sheet of paper containing short daily notes mainly of a business kind I was surprised to find, among some entries correctly dated 'September', the wrongly written date 'Thursday, October 20'. It is not difficult to explain this anticipation – and to explain it as the expression of a wish. A few days before, I had returned fresh from my holiday travels, and I felt ready for plenty of professional work; but there were not yet many patients. On my arrival I had found a letter from a patient to say she was coming on October 20. When I made an entry for the same day of the month in September I may well have thought: 'X. should have [117] been here already; what a waste of a whole month!', and with that thought in mind I brought the date forward a month. In this case the disturbing thought can scarcely be called an objectionable one; and for this reason I knew the solution to the slip of the pen as soon as I had noticed it. – In the autumn of the following year I made another slip of the pen which was precisely analogous and had a similar motive. – Ernest Jones [1911*b*] has made a study of slips like these in writing dates; in most cases they could be clearly recognized as having been motivated [*als motivierte erkannt*].

1 [Example 1, apart from the penultimate and final sentences (added in 1907 and 1912, respectively), and Example 2 date back to 1901.]

(2) I had received the proofs of my contribution to the *Jahresbericht für Neurologie und Psychiatrie*,[1] and I had naturally to revise the names of authors with particular care, since they are of various nationalities and therefore usually cause the compositor very great difficulty. I did in fact find some foreign-sounding names which were still in need of correction; but strangely enough there was one name which the compositor had corrected by *departing from* my manuscript. He was perfectly right to do so. What I had, in fact, written was 'Buckrhard', which the compositor guessed should be 'Burckhard'. I had actually praised the useful treatise which an obstetrician of that name had written on the influence of birth upon the origin of children's palsies, and I was not aware of having anything to hold against him; but he has the same name as a writer in Vienna who had annoyed me by an unintelligent review of my *Interpretation of Dreams*.[2] It is just as if in writing the name Burckhard, meaning the obstetrician, I had had a hostile thought about
[118] the other Burckhard, the writer;[3] for distorting names is very often a form of insulting their owners, as I have mentioned above [p. 72] in discussing slips of the tongue.

(3)[4] This assertion is very neatly confirmed by a self-observation of Storfer's (1914*a*), in which the author exposes with commendable frankness the motives that prompted him to recollect the name of a supposed rival wrongly and then to write it down in a distorted form:

'In December, 1910, I saw a book by Dr Eduard *Hitschmann* in the window of a bookshop in Zürich. Its subject was Freud's theory of the neuroses and it was new at the time. Just then I was at work on the manuscript of a lecture on the basic principles of Freud's psychology, which I was shortly to give before a university society. In the introductory part of the lecture which I had already written, I had referred to the historical development of Freud's psychology from his

1 [*Annual Review of Neurology and Psychiatry*. Freud wrote the abstracts and reviews for the section 'Cerebrale Kinderlähmung' [Cerebral Palsy] in the first three volumes of this annual; the contribution here referred to appeared in the third (1899) volume (Freud, 1900*b*). They are included in *NSW*, **3**.]

2 [Max Burckhard. His review appeared in *Die Zeit* on January 6 and 13, 1900. A comment on it by Freud can be found in his letter to Fliess of January 8, 1900 (1950*a*, Letter 127).]

3 Compare the scene in *Julius Caesar*, Act III, Scene 3:

CINNA: Truly, my name is Cinna.
A CITIZEN: Tear him to pieces; he's a conspirator.
CINNA: I am Cinna the poet . . .
I am not Cinna the conspirator.
ANOTHER CITIZEN: It is no matter, his name's Cinna; pluck but his name out of his heart, and turn him going.

[In the original this footnote is wrongly attached to the end of the sentence.]

Ink blots

Ink blots

The encircled ink blots appear in a letter Freud wrote to his fiancée Martha Bernays on August 9, 1882, in great agitation due to unfounded jealousy. Within the circle he wrote: 'Here the pen fell out of my hand and wrote this secret sign. Please forgive, and don't ask for an interpretation.' Twenty years before *The Psychopathology of Everyday Life*, this was the first indication that Freud recognized that hidden motives might lie behind a slip.

researches in an applied field, to certain consequent difficulties in giving a comprehensive account of its basic principles, and also to the fact that no general account of them had yet appeared. When I saw the book (whose author was till then unknown to me) in the shop window, I did not at first think of buying it. Some days later, however, I decided to do so. The book was no longer in the window. I asked the bookseller for it and gave the author's name as "Dr Eduard *Hartmann*". The bookseller corrected me: "I think you mean *Hitschmann*", and brought me the book.

'The unconscious motive for the parapraxis was obvious. I had so to speak given myself the credit for having written a comprehensive account of the basic principles of psychoanalytic theory, and obviously regarded Hitschmann's book with envy and annoyance since it took some of the credit away from me. I told myself, on the lines of *The Psychopathology of Everyday Life*, that the changing of the name was an act of unconscious hostility. At the time I was satisfied with this explanation.

'Some weeks later I noted down this parapraxis. On this occasion I [119] raised the further question of why Eduard Hitschmann had been altered precisely to Eduard *Hart*mann. Could I have been brought to the name of the well-known philosopher[1] merely because it was similar to the other one? My first association was the memory of a pronouncement which I once heard from Professor Hugo von Meltzl, an enthusiastic admirer of Schopenhauer, and which ran roughly as follows: "Eduard von Hartmann is a botched Schopenhauer, a Schopenhauer turned inside out." The affective trend by which the substitutive formation for the forgotten name was determined was therefore: "No, there will probably not be much in this Hitschmann and his comprehensive account; he probably stands to Freud as Hartmann does to Schopenhauer."

'I had, as I say, noted down this case of [psychologically] determined forgetting with the forgotten word replaced with a substitute.

'Six months later I came upon the sheet of paper on which I had made the note. I then observed that instead of Hitschmann I had throughout written *Hintsch*mann.'[2]

(4)[3] Here is what seems to be a more serious slip of the pen; I might perhaps equally well have included it among 'bungled actions' [Chapter VIII]:

1 [Eduard von Hartmann (1842–1906), author of *Philosophie des Unbewussten* (*Philosophy of the Unconscious*).]

2 ['*Hintsch*' is a dialect word for 'asthma' or, more generally, 'pest'.]

3 [This example dates back to 1901.]

I intended to draw the sum of 300 Kronen from the Post Office Savings Bank, which I wanted to send to an absent relative for purposes of medical treatment. At the same time I noticed that my account stood at 4,380 Kronen and decided to bring it down on this occasion to the round sum of 4,000 Kronen which was not to be touched in the near future. After I had duly written out the cheque and cut off the figures corresponding to the sum,[1] I suddenly noticed that I had not asked for 380 Kronen as I intended, but for exactly 438 Kronen, and I took alarm at
[120] the unreliability of my conduct. I soon realized that my alarm was not called for; I was not now any poorer than I had been before. But it took me a good deal of reflection to discover what influence had disturbed my first intention, without making itself known to my consciousness. To begin with I started on the wrong line; I tried subtracting 380 from 438, but I had no idea afterwards what to do with the difference. Finally, a thought suddenly struck me which showed me the true connection. Why, 438 was *ten per cent* of the total account, 4,380 Kronen! Now a ten per cent discount is given by *booksellers*. I recalled that a few days earlier I had picked out a number of medical books in which I was no longer interested in order to offer them to a bookseller for precisely 300 Kronen. He thought the price I was asking was too high, and promised to give me a definite answer within the next few days. If he accepted my offer he would replace the exact sum which I was to spend on the invalid. There is no doubt that I regretted this expenditure. My affect on perceiving my error can be understood better as a fear of growing poor as a result of such expenditures. But both these feelings, my regret at the expenditure and my anxiety over becoming poor that was connected with it, were entirely foreign to my consciousness; I did not have a feeling of regret when I promised the sum of money, and would have found the reason for it laughable. I should probably not have believed myself in any way capable of such an impulse had I not become fairly familiar, through my psychoanalytic practice with patients, with the part played by the repressed in mental life [*Seelenleben*], and had I not had a dream a few days before which called for the same solution.[2]

1 [In Austria at that time, withdrawals from the Post Office Savings Bank involved cutting off portions of a sheet of paper printed with columns of digits: the point at which the cut was made indicated the number of Kronen to be withdrawn.]

2 This is the one which I took as the specimen dream in my short work *On Dreams* (1901*a*). [The dream in question is discussed at many points in the course of that work, which was published very shortly before the publication of the parapraxis in the text above. The episode at the root of both the parapraxis and the dream can be found mentioned in *RSE*, **5**, 593. Another episode related to the same dream is mentioned below, on p. 119.]

(5)[1] I quote the following case from Wilhelm Stekel,[2] and can also vouch for its authenticity:

'A simply incredible example of a slip of the pen and misreading occurred in the editing of a widely read weekly periodical. The proprietors in question had been publicly described as "venal"; and an article in defence and vindication was clearly called for. One was in fact prepared: it was written with great warmth and feeling. The editor-in-chief read the article, while the author naturally read it several times in manuscript and then once more in galley-proof; everyone was perfectly satisfied. Suddenly the printer's reader came forward and pointed out a small mistake which had escaped everyone's notice. There it was, plainly enough: "Our readers will bear witness to the fact that we have always acted in the most *self-seeking* manner for the good of the community." It is obvious that it should have read: "in the most *unself-seeking* manner". But the true thoughts broke through the emotional statement with elemental force.'[3] [121]

(6)[4] A reader of the *Pester Lloyd*,[5] Frau Kata Lévy of Budapest, recently came across a similar unintended display of candour in a telegram from Vienna which appeared in the paper on October 11, 1918:

'In view of the complete mutual confidence which has prevailed between ourselves and our German allies throughout the war, it may be taken for certain that the two Powers would reach a unanimous decision in all circumstances. It is unnecessary to state specifically that active and *interrupted* cooperation between the allied diplomatists is taking place at the present stage as well.'

Only a few weeks later it was possible to express one's opinion more frankly about this 'mutual confidence', and there was no longer any need to take refuge in a slip of the pen (or misprint).

(7)[6] An American living in Europe who had left his wife on bad terms felt that he could now effect a reconciliation with her, and asked her to come across the Atlantic and join him on a certain date. 'It would be fine,' he wrote, 'if you could come on the *Mauretania* as I did.' He did not, however, dare to send the sheet of paper which had this sentence on it. He preferred to write it out again. For he did not want her to notice [122]

1 [Added 1907.]

2 [In 1907 and 1910 only: 'my colleague Wilhelm Stekel'.]

3 [Also mentioned by Freud in Lecture IV of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 55.]

4 [Added 1919.]

5 [The well-known Budapest German-language daily.]

6 [Added 1920.]

how he had had to correct the name of the ship. He had first written '*Lusitania*'.

This slip of the pen needs no explanation: its interpretation is perfectly plain. But a happy chance enables a further point to be added. Before the war his wife paid her first visit to Europe after the death of her only sister. If I am not mistaken, the *Mauretania* is the surviving sister-ship of the *Lusitania*, which was sunk in the war.

(8)[1] A doctor had examined a child and was making out a prescription for it, which included the word '*alcohol*'. While he was occupied in doing so the child's mother pestered him with stupid and unnecessary questions. He privately determined not to let this make him angry, and actually succeeded in keeping his temper, but made a slip of the pen in the course of the interruptions. Instead of *alcohol* the word *achol*[2] could be read on the prescription.

(9)[3] The following example, which Ernest Jones [1911*b*, 501] reports about A. A. Brill, has a similar subject matter, and I therefore insert it here. Although by custom a total abstainer, he allowed himself to be persuaded by a friend to drink a little wine. Next morning an acute headache gave him cause to regret having yielded in this way. He had occasion to write the name of a patient called *Ethel*; instead he wrote *Ethyl*.[4] It was no doubt of some relevance that the lady in question used to drink more than was good for her.

(10)[5] Since a slip of the pen on the part of a doctor who is writing a prescription possesses a significance which goes far beyond the practical importance of ordinary parapraxes [cf. p. 153 ff. below], I take the opportunity of reporting in full the only analysis published up to now of such a slip made by a doctor:

From Dr Eduard Hitschmann (1913*b*): 'A colleague tells me that several times over a period of years he had made an error in prescribing a certain drug for women patients of an advanced age. On two occasions he pre-
[123] scribed ten times the correct dose; only later did he suddenly realize this and was obliged, in the greatest anxiety in case he had harmed his patient and put himself in a very unpleasant position, to take the most hurried steps to recall the prescription. This singular symptomatic act deserves to be clarified by a more precise description of the individual instances and by an analysis.

1 [Added 1910.]

2 Approximately [in classical Greek]: 'No choler [anger].'

3 [Added 1912.]

4 I.e. ethyl alcohol [the chemical name for ordinary alcohol].

5 [Added 1917.]

'First instance: In treating a poor woman bordering on extreme old age who was suffering from spastic constipation the doctor prescribed belladonna suppositories ten times too strong. He left the out-patients' department, and his error suddenly sprang to his mind about an hour later while he was at home reading the paper and having lunch; he was overcome by anxiety, rushed first to the out-patients' department to obtain the patient's address and hastened from there to her home, which was a long way off. He was delighted to find that the old woman had not yet had the prescription made up, and he returned home much relieved. The excuse that he gave himself on this occasion was the not unjustified one that the talkative head of the out-patients' department had looked over his shoulder while he was writing the prescription and had distracted him.

'Second instance: The doctor was obliged to tear himself away from a consultation with a flirtatious and provocatively attractive patient in order to pay a professional visit to an elderly spinster. He took a taxi, not having much time to spare for the visit; for he was due to keep a secret rendezvous with a girl he was in love with, at a certain time, near her house. Here, too, belladonna was indicated because of troubles analogous to those in the first instance. Once again he made the mistake of prescribing a quantity ten times too strong. The patient raised a question that was of some interest but irrelevant to the matter in hand; the doctor, however, showed impatience, though his words denied it, and left the patient, so that he appeared at the rendezvous in very good time. Some twelve hours later, at about seven o'clock in the morning, the doctor woke up; the thought of his slip of the pen and a feeling of anxiety came almost simultaneously to his consciousness, and he sent a hasty message to the patient in the hope that the medicine had not yet been collected from the chemist's, and asked for the prescription to be sent back in order to be revised. On receiving it, however, he found that the prescription had already been made up; with a somewhat stoical resignation and an optimism born of experience he went to the chemist, where the dispenser reassured him by explaining that he had naturally (or perhaps by mistake too?) made up the drug in a smaller dose. [124]

'Third instance: The doctor wanted to prescribe a mixture of *Tinct. belladonnae* and *Tinct. opii* in a harmless dose for his old aunt, his mother's sister. The prescription was immediately taken to the chemist by the maid. A very short time later it occurred to the doctor that instead of "tincture" he had written "extract", and immediately afterwards the chemist telephoned to question him about the error. The doctor gave as

an excuse the untruthful explanation that he had not completed the prescription – it had been carried off from his table with unexpected suddenness, so it was not his fault.

'These three errors in making out prescriptions have the following striking points of resemblance. Up to now it has only happened to the doctor with this one drug; each time it involved a woman patient of advanced years, and each time the dose was *too strong*. From the brief analysis it emerged that the doctor's relation to his mother must have been of decisive importance. For he recalled that on one occasion – one, moreover, which most probably occurred *before* these symptomatic acts – he had made out the same prescription for his mother, who was also an old woman; he had ordered a dose of 0.03, although he was more familiar with the usual dose of 0.02. This, as he told himself, was in order to give her radical help. His frail mother reacted to the drug with congestion in the head and an unpleasant dryness of the throat. She complained of this, alluding half-jokingly to the risks that could come from a consultation with a son. There were, in fact, other occasions when his mother, who was, incidentally, a doctor's daughter, raised similar critical and half-jocular objections to drugs recommended at various times by her doctor son, and spoke of being poisoned.

'So far as the present writer can fathom this son's relations with his
Instinkt mother, there is no doubt that he is an instinctively [*instinktiv*]^{T} affectionate child, but his mental estimate of his mother and his personal respect for her are by no means exaggerated. He shares a household with
[125] a brother a year younger than himself and with his mother, and has felt for years that this arrangement was inhibiting his erotic freedom. We have, of course, learnt from psychoanalytic experience that such reasons are readily misused as an excuse for an internal [incestuous] attachment. The doctor accepted the analysis, being fairly well satisfied with the explanation, and laughingly suggested that the word "*belladonna*" (i.e. beautiful woman) could also have an erotic reference. He had also occasionally used the drug himself in the past.'

In my judgement serious parapraxes like the present ones are brought about in exactly the same way as the innocent ones that we normally investigate.

(11)[1] The next slip of the pen, reported by Sándor Ferenczi, will be thought quite especially innocent. It can be understood as being an act of condensation, resulting from impatience (compare the slip of the tongue, 'Der Apfe', above, p. 53); and this view might have been

1 [This example and No. 12 were added in 1919.]

maintained if a penetrating analysis of the occurrence had not revealed a stronger disturbing factor:

'"I am reminded of the *Anektode*",[1] I once wrote in my notebook. Naturally I meant "*Anekdote* [anecdote]"; actually it was the one about a gipsy who had been sentenced to death [*Tode*], and who asked as a favour to be allowed himself to choose the tree from which he was to be hanged. (In spite of a keen search he failed to find any suitable tree.)'

(12) On the other hand, there are times when the most insignificant slip in writing can serve to express a dangerous secret meaning. An anonymous correspondent reports:

'I ended a letter with the words: "Herzlichste Grüsse an Ihre Frau Gemahlin und *ihren* Sohn."[2] Just before I put the sheet in the envelope I noticed the error I had made in the first letter of "ihren" and corrected it. On the way home from my last visit to this married couple the lady who was with me had remarked that the son bore a striking resemblance to a family friend and was in fact undoubtedly his child.'

(13)[3] A lady sent her sister a message of good wishes on the occasion of her taking up residence in a new and spacious house. A friend who was present noticed that the writer had put the wrong address on the letter. She had not even addressed it to the house that her sister had just left, but to her first house which she had moved into immediately after her marriage and had given up long before. This friend drew the lady's attention to the slip. 'You're right', she was forced to confess; 'but how did the idea come into my head? Why did I do it?' 'I think', said her friend, 'you probably grudge her the fine large home which will now be hers, while you feel yourself cramped for space; and therefore you put her back in her first home where she was no better off than you are.' 'I certainly grudge her her new home', the other frankly admitted, and added: 'What a pity one's always so petty in such things!' [126]

(14)[4] Ernest Jones [1911*b*, 499] reports the following slip of the pen, which was supplied to him by A. A. Brill:

'A patient wrote to him [Dr Brill] on the subject of his sufferings, which he tried to attribute to worry about his financial affairs induced by a cotton crisis: "My trouble is all due to that d——d frigid wave; there isn't even any seed." (By "wave" he meant of course a trend in the money

1 [A non-existent word; but the last part of it, '*Tode*', means 'death'.]

2 ['Warmest greetings to your wife and her son.' The German possessive adjective '*ihr*', as spelt with a small 'i', means 'her'; when spelt with a capital 'I', it means 'your'.]

3 [Added 1910.]

4 [Examples 14–16 were added in 1912.]

market.) What he really wrote, however, was not "wave" but "wife". In the bottom of his heart he cherished half-avowed reproaches against his wife on account of her sexual anaesthesia and childlessness, and he dimly realized, with right, that his life of enforced abstinence played a considerable part in the genesis of his symptoms.'

(15) Dr R. Wagner (1911) relates of himself:

'In reading through an old lecture notebook I found that I had made a small slip in the hurry of taking down the notes. Instead of "*Epithel* [epithelium]", I had written "*Edithel*". If we stress the first syllable we have the diminutive form of a girl's name.[1] The retrospective analysis is simple enough. At the time I made the slip I was only very superficially acquainted with the lady of this name; it was not till much later that our
[127] relations became intimate. The slip of the pen is therefore a neat indication of the breakthrough of the unconscious attraction I felt to her at a time when I myself actually had no inkling of it, and my choice of the diminutive form at the same time showed the nature of the accompanying feelings.'

(16) From Frau Dr von Hug-Hellmuth (1912):

'A doctor prescribed "*Leviticowasser* [Levitical water]" for a woman patient instead of "*Levicowasser*".[2] This error, which gave a chemist a welcome opportunity for passing adverse comments, may very well be viewed in a milder light if one looks out for the possible motivations arising from the unconscious and is prepared at any rate to concede them a certain plausibility – even though they are merely the subjective conjectures of someone who is not closely acquainted with the doctor. In spite of his habit of using somewhat harsh language to scold his patients for their far-from-rational diet – to read them a lecture ["*die Leviten lesen*"], so to speak – the doctor enjoyed great popularity, so that his waiting room was crowded before and during his consulting hour; and this provided a justification for his wish that the patients he had seen should dress as quickly as possible – "*vite*, *vite*" [French for "quickly, quickly"]. If I remember correctly, his wife was French by birth: this lends some support to my seemingly rather bold assumption that he used *French* in his wish for greater speed from his patients. It is in any case a habit of many people to draw on foreign words to express such wishes: my own father hurried us along as children on our walks by calling out "*avanti gioventù*" [Italian for "forward, youth"] or "*marchez au pas*"

1 [In Austria 'l' is the most common diminutive termination.]

2 [A mineral water from the arsenical and chalybeate springs of Levico, a health resort in South Tyrol.]

[French for "forward march"]; while a very elderly physician, with whom I was in treatment for a throat complaint as a girl, used to try to inhibit my movements, which seemed much too hasty to him, by murmuring a soothing "*piano, piano*" [Italian for "gently, gently"]. Thus I can very easily imagine that the other doctor had the same habit too, and so made the slip of writing "*Leviticowasser*" instead of "*Levicowasser*".'

The same paper contains other examples recalled from its author's youth ('*frazösisch*' instead of '*französisch*', and a slip in writing the name 'Karl').

(17)[1] I have to thank Herr J. G., who also contributed an example [128]
mentioned above[2] for the following account of a slip of the pen. In content it is identical to a notorious bad joke, but in this case the intention of making a joke could be definitely ruled out:

'While I was a patient in a (lung) sanatorium I learnt to my regret that the same illness which had forced me to seek treatment in an institution had been diagnosed in a close relative of mine. In a letter to my relative I recommended him to go to a specialist, a well-known professor, with whom I was myself in treatment, and of whose authority in medical matters I was fully satisfied, while having at the same time every reason to deplore his discourteousness: for, only a short time before, this same professor had refused to write me a testimonial which it was very important for me to have. In his reply to my letter my relative drew my attention to a slip of the pen which, since I immediately recognized the cause of it, gave me particular amusement. In my letter I had used the following phrase: "and so I advise you to *in*sult Professor X. without delay". I had, of course, intended to write "*con*sult". I should perhaps point out that my knowledge of Latin and French rules out the possibility of explaining it as a mistake due to ignorance.'

(18)[3] Omissions in writing have naturally a claim to be considered in the same light as slips of the pen. Dattner (1911) has reported a curious instance of a 'historical parapraxis'. In one of the sections of the law dealing with the financial obligations of Austria and Hungary, settled in the 'Compromise' of 1867 between the two countries, the word 'actual' was left out of the Hungarian translation; and Dattner makes it plausible to suppose that the unconscious desire of the Hungarian parliamentary

1 [Added 1920.]

2 [This other example seems actually to appear *below*, on p. 193.]

3 [Added 1912.]

draftsmen to grant Austria the least possible advantages played a part in causing the omission.[1]

[129] We have every reason to suppose,[2] too, that the very frequent repetitions of the same word in writing and copying – 'perseverations' – are likewise not without significance. If the writer repeats a word he has already written, this is probably an indication that it was not so easy for him to get away from it: that he could have said more at that point but had omitted to do so, or something of the kind. Perseveration in copying seems to be a substitute for saying 'I too'. I have had lengthy medico-legal 'opinions' before me which show perseverations on the copyist's part at particularly important passages. The interpretation I should have liked to give them would be that, bored with his impersonal role, the copyist was introducing his own gloss: 'just my case' or 'it's just the same with us'.

(19) Furthermore, there is nothing to prevent our treating misprints as 'writing mistakes' on the compositor's part, and our regarding them as being in a very great measure [psychologically] motivated. I have not set about making a systematic collection of such parapraxes, which could be very amusing and instructive. In the work which I have already referred to a number of times, Jones [1911*b*, 503–4] has devoted a special section to misprints.

The distortions[3] found in the text of telegrams can also at times be understood as writing mistakes on the telegraphist's part. In the summer holidays I received a telegram from my publishers, the text of which was unintelligible to me. It ran: 'Vorräte erhalten, Einladung X. dringend.' ['Provisions received, invitation X. urgent.'] The solution to the riddle starts from the name X. mentioned in it. X. was the author of a book to which I was to write an '*Einleitung* [introduction]'. This '*Einleitung*' was what had been turned into the '*Einladung* [invitation]'. I was then able to recall that some days earlier I had sent my publishers a '*Vorrede* [preface]' to another book; so this was the acknowledgement of its arrival. The true text had very probably run: 'Vorrede erhalten, Einleitung X. dringend.' ['Preface received, introduction X. urgent.'] We may assume that it had fallen victim to a revision by the telegraphist's hunger complex, in the course of which, moreover, the two halves of the

[130] sentence became linked more closely than the sender had intended. It is,

1 [Dattner's article gives a detailed account of the intricate way in which the omission of the word would have damaged Austria financially.]

2 [This paragraph and the next one were added in 1917.]

3 [This paragraph was added in 1920, and the reference to Silberer's paper in 1924.]

incidentally, a pretty instance of the 'secondary revision' that can be seen at work in most dreams.[1]

The possibility of 'tendentious misprints' has been discussed by Herbert Silberer (1922).

(20)[2] From time to time other writers have drawn attention to misprints the tendentiousness of which cannot easily be challenged. See, for example, Storfer's paper 'The Political Demon of Misprints' (1914) and his short note (1915) which I reprint here:

'A political misprint is to be found in the issue of *März* for April 25 of this year. A dispatch from Argyrokastron reported some remarks made by Zographos, the leader of the insurgent Epirotes in Albania (or, if that is preferred, the President of the Independent Government of the Epirus). It included the following phrase: "Believe me: a self-governing Epirus would be in the most fundamental interest of Prince Wied. He could fall down ['*sich stürzen*', a misprint for '*sich stützen*', 'support himself'] on it." Even without this fatal misprint the Prince of Albania is no doubt well aware that the acceptance of the support ["*Stütze*"] offered him by the Epirotes would mean his downfall ["*Sturz*"]'.

(21) I myself recently read an article in one of our Vienna daily papers, the title of which – 'The Bukovina under *Rumanian* Rule' – would have at least to be called premature, since at the time Rumania had not yet disclosed herself as an enemy. From the content of the article it was quite clear that the word should have been 'Russian', not 'Rumanian'; yet the censor, too, seems to have found the phrase so little surprising that even he overlooked this misprint.

It is hard[3] to avoid suspecting a 'political' misprint on coming across the following 'literal' misprint in a circular from the celebrated (formerly the Imperial and Royal) printing firm of Karl Prochaska in Teschen:

'By a decree of the Entente Powers, fixing the frontier at the River Olsa, not only Silesia but Teschen as well have been divided into two [131]
parts, of which one *zuviel*[4] to Poland and the other to Czecho-Slovakia.'

Theodor Fontane was once obliged to take up arms in an amusing way against a misprint which was only too full of meaning. On March 29, 1860, he wrote to the publisher Julius Springer:

1 Cf. [Section I of] the chapter on the dream-work in my *Interpretation of Dreams* [1900*a*; *RSE*, **5**, 437 ff.].

2 [Examples 20 and 21 were added in 1917.]

3 [This example and the following one were added in 1924.]

4 ['Too much.' The word should have been the similarly pronounced '*zufiel*', 'fell to the share of'. The German-Austrian compositor objected to the distribution of what had been part of the Habsburg Empire.]

'Dear Sir,

'I seem to be fated not to see my modest wishes fulfilled. A glance at the proof sheets[1] which I enclose will tell you what I mean. What is more, I have been sent only *one* set of proofs, although I need two, for reasons which I have already given. And my request that the first set should be returned to me for further revision – *with special regard to the English words and phrases* – has not been carried out. I set great store by this. For instance, on page 27 of the present sheets a scene between John Knox and the Queen contains the words: "worauf Maria aasrief".[2] In the face of such a fulminating mistake, it would be a relief to know that it has really been removed. The unfortunate "*aas*" for "*aus*" is made all the worse by there being no doubt that she (the queen) must really have called him that to herself.

'Yours faithfully,
'Theodor Fontane.'

Wundt (1900, 374) gives an explanation[3] which deserves notice for the fact (which can easily be confirmed) that we make slips of the pen more readily than slips of the tongue. 'In the course of normal speaking the inhibitory function of the will is continuously directed to bringing the course of ideas and the articulatory movements into harmony with each other. If the expressive movement which follows the ideas is
[132] retarded through mechanical causes, as is the case in writing . . ., such anticipations make their appearance with particular ease.'[4]

Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting point for a fruitful investigation. Everyone knows how frequently the reader finds that in *reading aloud* his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly.[5] I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are

1 The book in question was *Beyond the Tweed: Sketches and Letters from Scotland*, which Julius Springer published in 1860.

2 ['On which Mary "*aasrief*": i.e. cried '*Aas*' (literally 'carrion'; colloquially 'filthy blackguard'). The word should have been '*ausrief*' meaning simply 'cried out'.]

3 [This paragraph and the following one date back to 1901.]

4 [For an example (from Meringer & Mayer, 1895) of what Wundt means by an 'anticipation' see pp. 46–7 above.]

5 [Freud had commented on this fact in his monograph on aphasia (1891*b*, 78; *NSW*, **4**). A translation of the passage in question can be found in Appendix C to the English version of his paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 188–9.]

accustomed to assume will be performed most exactly when done automatically – that is, with scarcely any conscious attention.[1] From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a *disturbance* of attention by an alien thought which claims consideration.

Between 'slips of the pen' and 'forgetting'[2] may be inserted the case of someone who forgets to append a signature. An unsigned cheque comes to the same thing as a forgotten cheque. For the significance of a forgetting of a similar kind I will cite a passage from a novel, which Dr Hanns Sachs came upon:

'A very instructive and transparent example of the sureness with which [133]
imaginative writers know how to employ the mechanism of parapraxes and symptomatic acts in the psychoanalytic sense is contained in John Galsworthy's novel *The Island Pharisees*. The story centres on the vacillations of a young man of the well-to-do middle class between his strong social sympathy and the conventional attitudes of his class. Chapter XXVI portrays the way in which he reacts to a letter from a young ne'er-do-well, to whom – prompted by his original attitude to life – he had supplied help on two or three occasions. The letter contains no direct request for money, but paints a picture of great distress which can have no other meaning. Its recipient at first rejects the idea of throwing the money away on a hopeless case instead of using it to support charitable causes. "To give a helping hand, a bit of himself, a nod of fellowship to any fellow-being irrespective of a claim, merely because he happened to be down, was sentimental nonsense! The line must be drawn! But in the muttering of this conclusion he experienced a twinge of honesty. 'Humbug! You don't want to part with your money, that's all!'"

'Thereupon he wrote a friendly letter, ending with the words: "I enclose a cheque. Yours sincerely, Richard Shelton."

'"Before he had written out the cheque, a moth fluttering round the candle distracted his attention, and by the time he had caught and put it

1 [Instances of attention interfering with the automatic process involved in the appreciation of jokes can be found in Freud's book on *Jokes* (1905*c*). See *RSE*, **8**, 131–3. Cf. also pp. 234–5 below.]

2 [The remainder of the chapter was added in 1919.]

out he had forgotten that the cheque was not enclosed." The letter was posted, in fact, just as it was.

'There is, however, an even subtler motivation for the lapse of memory than the breakthrough of the selfish purpose, which had apparently been surmounted, of avoiding giving away the money.

'At the country seat of his future parents-in-law, surrounded by his fiancée, her family and their guests, Shelton felt isolated; his parapraxis indicates that he longed for his protégé who, as a result of his past and of his view of life, forms a complete contrast to the irreproachable company, uniformly moulded by one and the same set of conventions, that surround him. And, in fact, this person, who can no longer keep his place without being supported, does actually arrive some days later to get an explanation of why the promised cheque was not there.'

VII

THE FORGETTING OF IMPRESSIONS AND INTENTIONS[1]

If anyone should feel inclined to overestimate the state of our present [134]
knowledge of mental life, a reminder of the function of memory is all that would be needed to force him to be more modest. No psychological theory has yet succeeded in giving a connected account of the fundamental phenomenon of remembering and forgetting; in fact, the complete analysis of what can actually be observed has so far scarcely been begun. Today, forgetting has perhaps become more of a puzzle than remembering, ever since we have learnt from the study of dreams and pathological phenomena that even something we thought had been forgotten long ago may suddenly re-emerge in consciousness.[2]

There are, it is true, a few indications already in our possession which we expect to be accepted generally. We assume that forgetting is a spontaneous process which may be regarded as requiring a certain length of time. We lay stress on the fact that forgetting involves a certain selection taking place from among the impressions presented to us, and similarly from among the details of each impression or experience. We know some of the conditions enabling what would otherwise have been forgotten to be retained in the memory and to be reawakened. Nevertheless, on countless occasions in daily life we can observe how imperfect and unsatisfactory our understanding of these conditions is. Thus we may listen to two people who were in receipt of the same external impres- [135]
sions – who took a journey together, for example [cf. p. 27 ff. above] – exchanging recollections at some later date. What has remained firm in the memory of one of them has often been forgotten by the other, as if it had never happened; and this is true even where there is no justification

1 [The first part of this chapter, up to p. 122, dates back to 1901.]

2 [The following note is to be found at this point in Freud's interleaved copy of the 1904 edition (cf. Editors' Introduction, p. xvi above): 'Normal forgetting takes place by way of condensation. In this way it becomes the basis for the formation of concepts. What is isolated is perceived clearly. Repression makes use of the mechanism of condensation and produces a confusion with other similar cases. – In addition, trends from other quarters take possession of the indifferent material and cause it to be distorted and falsified.' Cf. a footnote added in 1907, p. 235 *n. 3* below, where these ideas are developed.]

for assuming that the impression was psychically of greater importance for the one than for the other. A whole quantity of factors determining the choice of what is to be remembered are obviously still beyond our ken.

With the aim of making a small contribution to our knowledge of the determinants of forgetting I make it my practice to submit to a psychological analysis those cases in which I myself forget something. I am as a rule only concerned with a certain group of these cases, namely those in which the forgetting surprises me because I should have expected to know the thing in question. I may add that I am not in general inclined to forget things (things I have experienced, that is, not things I have learnt!), and that for a short period of my youth some unusual feats of memory were not beyond me. When I was a schoolboy I took it as a matter of course that I could repeat by heart the page I had been reading; and shortly before I entered the university I could write down almost verbatim popular lectures on scientific subjects directly after hearing them. In the period of tension before my final medical examination I must have made use once more of what remained of this faculty, for in some subjects I gave the examiners, as though it were automatically, answers which faithfully followed the words of the textbook that I had skimmed through only once in the greatest haste.

Since then the command that I have over my store of memories has steadily deteriorated; yet right up to the most recent times I have convinced myself over and over again that with the aid of a certain device I can remember far more than I would otherwise have believed possible. When, for instance, a patient in my consulting hour claims that I have seen him before and I can recall neither the fact nor the time, I help myself by guessing: that is to say, I quickly think of a number of years, counting back from the present. In cases where records or more definite information from the patient enable me to check what has come to my
[136] mind, they show that I have rarely been more than half a year out in ten.[1] I have a similar experience when I meet a distant acquaintance and out of politeness enquire after his small children. If he describes their progress I try to think at random of the child's present age. I afterwards check my estimate by what the father tells me; and at the most I am wrong by a month, or with older children by three months, although I am unable to say on what my estimate was based. I have latterly grown so bold that I always produce my estimate spontaneously without running any risk of offending the father by exposing my ignorance about his

1 In the course of the subsequent consultation the details of the previous visit usually emerge into my consciousness.

offspring. In this way I extend my conscious memory by invoking my unconscious memory, which is in any case far more extensive.

I shall accordingly cite some *striking* examples of forgetting, most of which I observed in myself. I distinguish the forgetting of impressions and experiences – i.e. of knowledge – from the forgetting of intentions – i.e. from omission to do things. I can state in advance the invariable result of the entire series of observations: *in every case the forgetting turned out to be based on a motive of unpleasure*.

(A) The Forgetting of Impressions and Knowledge

(1) One summer holiday my wife made me greatly annoyed though the cause was innocent enough. We were sitting at table d'hôte opposite a gentleman from Vienna whom I knew and who no doubt remembered me too. However, I had reasons of my own for not renewing the acquaintance. My wife, who had heard no more than his distinguished name, revealed too plainly that she was listening to his conversation with his neighbours, for from time to time she turned to me with questions that took up the thread of their discussion. I became impatient and finally irritated.[1] Some weeks later I was complaining to a relative about this behaviour on my wife's part but was unable to recall a single word of the gentleman's conversation. As I am normally rather apt to harbour grievances and can forget no detail of an incident that has annoyed me, my [137]
amnesia in the present case was probably motivated by consideration for my wife. A short time ago I had a similar experience. I wished to have a good laugh with an intimate friend over a remark made by my wife only a few hours before, but was prevented from doing so by the singular fact that I had utterly forgotten what she had said. I had first to ask my wife to remind me what it was. It is easy to understand my forgetfulness here as being analogous to[2] the typical disturbance of judgement to which we are subject where those nearest to us are concerned.

(2) I had undertaken to get a lady who was a stranger to Vienna a small strongbox for her documents and money. When I offered my services I had in my mind's eye an unusually vivid picture of a shop window in the Inner Town[3] in which I was sure I had seen boxes of the kind. I could not, it was true, recall the name of the street, but I felt sure

1 [The episode appears also among the associations to a dream related in *On Dreams* (1901*a*), *RSE*, **5**, 577 f. This dream is referred to above in connection with another episode. See footnote 2, p. 104.]

2 [In 1901 only: 'an instance of'.]

3 [The central part of Vienna.]

that I would find the shop if I walked through the town, since my memory told me I had passed it on countless occasions. To my chagrin I had no success in finding the shop window with the strongboxes, though I walked all over the Inner Town in every direction. I decided that the only course left was to look up the firms of safe manufacturers in a trades directory, so as to be able to identify the shop on a second walk round the town. Such extreme measures, however, did not prove necessary; among the addresses given in the directory was one which I immediately recognized as the one I had forgotten. It was true that I had passed the shop window innumerable times – every time, in fact, that I had visited the M. family, who have lived for many years in the same building. Our intimate friendship later gave place to a total estrangement; after that, I fell into the habit – the reasons for which I never considered – of also avoiding the neighbourhood and the house. On my walk through the town in search of the shop window with the strongboxes I had passed through every street in the district but this one, which I had avoided as if it were forbidden territory. The motive of unpleasure responsible in the present case for my failure to find my way is easy to recognize. The mechanism of forgetting, however, is not so simple here as in the preceding example. My aversion naturally applied not to the safe manufacturer but to
[138] another person, whom I did not want to think about; and from this latter person it was then transferred to this occasion where it produced the forgetting. The case of 'Burckhard' [p. 102 above] was very similar; my grudge against one person of this name induced me to make a slip in writing the same name when it referred to someone else. The part there played by identity of name in establishing a connection between two essentially different groups of thoughts was able to be replaced in the example of the shop window by spatial contiguity, inseparable proximity. This latter case was, incidentally, more firmly knit; there was a second connection there, one involving its subject matter, for money played a part[1] among the reasons for my estrangement from the family living in the building.

(3) I was requested by the firm of B. and R. to pay a professional visit to one of their staff. On my way there I was possessed by the thought that I must repeatedly have been in the building where their firm had its premises. It was as if I had noticed their plate on a lower storey while I was paying a professional visit on a higher one. I could, however, recall neither what house it was nor whom I had visited there. Although the whole matter was of no importance or consequence, I nevertheless

1 [In 1901, 1904 and 1907 only: 'a great part'.]

turned my mind to it and finally discovered in my usual roundabout way, by collecting the thoughts that occurred to me in connection with it, that the premises of the firm of B. and R. were on the floor below the Pension Fischer, where I have frequently visited patients. At the same time I also recalled the building that housed the offices and the pension. It was still a puzzle to me what motive was at work in this forgetting. I found nothing offensive to my memory in the firm itself or in the Pension Fischer or the patients who lived there. Moreover, I suspected that nothing very distressing could be involved; otherwise I would hardly have succeeded in recovering in a roundabout way what I had forgotten, without resorting to external assistance as I had in the previous example. It finally occurred to me that, while I was actually on my way to this new patient, a gentleman whom I had difficulty in recognizing had greeted me in the street. I had seen this man some months before in an apparently grave condition and had passed sentence on him with a diagnosis of progressive paralysis; but later I heard he had recovered, so that my judgement [139] must have been wrong. Unless, that is, there had been a remission of the type that is also found in dementia paralytica – in which case my diagnosis would be justified after all! The influence that made me forget where the offices of B. and R. were came from my meeting with this person, and my interest in solving the problem of what I had forgotten was transferred to it from this case of disputed diagnosis. But the associative link (for there was only a slender internal connection – the man who recovered contrary to expectation was also an official in a large firm which used to recommend patients to me) was provided by an identity of names. The physician with whom I had seen the supposed case of paralysis was also called Fischer, like the pension which was in the building and which I had forgotten.

(4) Mislaying [*verlegen*] something is really the same as forgetting [*vergessen*] where it has been put. Like most people who are occupied with writing and books I know my way about on my writing table and can lay my hands straight away on what I want. What appears to other people as disorder is for me order with a history behind it. Why, then, did I recently mislay a book catalogue, which had been sent to me, so that it was impossible to find it? I had, in fact, intended to order a book, *Über die Sprache* [On Language], which was advertised in it, since it was by an author whose witty and lively style I like and whose insight in psychology and knowledge of the history of civilization I have learnt to value. I believe that this is precisely why I mislaid the catalogue. For it is my habit to lend books by this author to my acquaintances for their

enlightenment, and a few days previously one of them had remarked as he returned a copy: 'His style reminds me very much of your own, and his way of thinking, too, is the same as yours.' The speaker did not know what he was touching on by that remark. Years before, when I was younger and in greater need of outside contacts, an elder colleague to whom I had praised the writings of a well-known medical author had made almost the same comment: 'It's just your style and your manner.' Prompted by this remark I had written a letter to the author seeking closer relations with him, but had been put in my place by a chilly answer. Perhaps still earlier discouraging experiences as well lie concealed behind
[140] this one, for I never found the mislaid catalogue and was in fact deterred by this omen from ordering the advertised book, although the disappearance of the catalogue formed no real hindrance since I could remember the names of both book and author.[1]

(5)[2] Another case of mislaying merits our interest on account of the conditions under which the mislaid object was rediscovered. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of "attention", promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which time I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty[3] opened one of the drawers. On the very top I found the long-lost book I had mislaid.'[4]

(6)[5] A case of mislaying which shares the last characteristic of the above example – namely, the remarkable sureness shown in finding the

1 Accidental occurrences of various sorts which since Theodor Vischer [see footnote 1, p. 147 below] have been put down to 'the perverseness of things' might, I think, be similarly explained.

2 [Added 1907.]

3 [See footnote 1, p. 145 below.]

4 [Later quoted by Freud in Lecture III of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 49.]

5 [Added 1917.]

object again once the motive for its being mislaid had expired – is reported by Stärcke (1916):

'A girl had spoilt a piece of material in cutting it out to make a collar; so the dressmaker had to come and do her best to put it right. When she had arrived and the girl wanted to fetch the badly cut collar, she went to [141]
the drawer where she thought she had put it; but she could not find it. She turned the contents upside down without discovering it. Sitting down in exasperation she asked herself why it had suddenly disappeared and whether there was not some reason why she did not *want* to find it. She came to the conclusion that of course she felt ashamed in front of the dressmaker for having bungled something so simple as a collar. After this reflection she stood up, went to another cupboard and was able to lay her hands straight away on the badly cut collar.'

(7)[1] The following example of 'mislaying' is of a type that has become familiar to every psychoanalyst. I may remark that the patient responsible for it found the solution himself:

'A patient, whose psychoanalytic treatment was interrupted by the summer holidays at a time when he was in a state of resistance and felt unwell, put his bunch of keys in its usual place – or so he thought – when he undressed for the night. Then he remembered that there were a few more things that he needed for his journey next day – the last day of treatment and the date on which his fee was due – and he went to get them out of the writing desk, in which he had also put his money. But the keys had disappeared. He began to make a systematic but increasingly agitated search of his small flat – with no success. Since he recognized the "mislaying" of the keys as a symptomatic act – that is, as something he had done intentionally – he woke his servant in order to continue the search with the aid of an "unprejudiced" person. After another hour he gave it up and was afraid he had lost the keys. Next morning he ordered new keys from the makers of the desk, and they were hastily made for him. Two friends, who had come home with him in the same cab, thought they remembered hearing something fall with a clink on the ground as he stepped out of the cab. He was convinced that his keys had fallen from his pocket. That evening the servant triumphantly presented him with the keys. They had been found lying between a thick book and a thin pamphlet (a work by one of my pupils) which he wanted to take away to read on his holiday. They were so cleverly placed that no-one would have suspected they were there. He found himself afterwards unable [142]
to replace them so that they were equally invisible. The unconscious

1 [Added 1910.]

dexterity with which an object is mislaid on account of hidden but powerful motives is very reminiscent of "somnambulistic certainty".[1] The motive, as one would expect, was ill-temper at the treatment being interrupted and secret rage at having to pay a high fee when he was feeling so unwell.'

(8)[2] 'A man', Brill [1912] relates, 'was urged by his wife to attend a social function in which he really took no interest . . . Yielding to his wife's entreaties, he began to take his dress suit from the trunk when he suddenly thought of shaving. After accomplishing this he returned to the trunk and found it locked. Despite a long, earnest search the key could not be discovered. No locksmith was available on Sunday evening, so that the couple had to send their regrets. When he had the trunk opened the next morning the lost key was found within. The husband had absent-mindedly dropped the key into the trunk and sprung the lock. He assured me that this was wholly unintentional and unconscious, but we know that he did not wish to go to this social affair. The mislaying of the key therefore lacked no motive.'

Ernest Jones [1911*b*, 506] observed in himself that he was in the habit of mislaying his pipe whenever he had smoked too much and felt unwell in consequence. The pipe then turned up in all sorts of places where it did not belong and where it was not normally put away.

(9)[3] An innocent case, in which the motivation was admitted, is reported by Dora Müller (1915):

'Fräulein Erna A. told me two days before Christmas: "Can you imagine? Yesterday evening I took a piece of my gingerbread from the packet and ate it; at the same time I thought I would have to offer some to Fräulein S." (her mother's companion) "when she came to say goodnight to me. I didn't particularly want to, but I made up my mind to do so all the same. Later on when she came I reached out to get the packet
[143] from my table; but it was not there. I had a look for it and found it inside my cupboard. I had put the packet away there without realizing." No analysis was necessary; the narrator herself understood the sequence of events. The impulse of wanting to keep the cake all to herself, which had just been repressed, had nevertheless achieved its end in the automatic act, though in this case it was cancelled out once more by the subsequent conscious act.'

(10) Sachs describes how, by a similar act of mislaying, he once avoided the duty of working: 'Last Sunday afternoon I hesitated for

1 [See below, footnote 1, p. 145.]

2 [*Added* 1912. – This is quoted from Brill's original, of which Freud has made a very slightly modified translation.]

3 [This example and No. 10 were added in 1917.]

some time over whether I should work or take a walk and pay a visit at the end of it; but after a bit of a struggle I decided in favour of the former. After about an hour I noticed that my supply of paper was exhausted. I knew that somewhere in a drawer there was a stack of paper that I had had for years, but I looked in vain for it in my writing desk and in other places where I thought I might find it, although I went to a lot of trouble and rummaged round in every possible place – old books, pamphlets, letters and so on. Thus I finally found myself compelled to break off my work and go out after all. When I returned home in the evening, I sat down on the sofa, and, sunk in thought and half-absent-mindedly, gazed at the bookcase in front of me. A box caught my eye and I remembered that I had not examined its contents for a long time. So I went over and opened it. At the very top was a leather portfolio containing unused paper. But it was only when I had taken it out and was on the point of putting it in the drawer of my desk that it occurred to me that this was the very same paper I had been unsuccessfully looking for in the afternoon. I must add here that although I am not ordinarily thrifty I am very careful with paper and keep any scraps that can be used. It was obviously this practice of mine, which is nourished by a drive [*Triebe*], that enabled my forgetfulness to be corrected as soon as the immediate motive for it had disappeared.'

If a survey is made of cases of mislaying,[1] it in fact becomes hard to believe that anything is ever mislaid except as a result of an unconscious intention.

(11)[2] One day in the summer of 1901 I remarked to a friend with whom [144]
I used at that time to have a lively exchange of scientific ideas:[3] 'These problems of the neuroses are only to be solved if we base ourselves wholly and completely on the assumption of the original bisexuality of the individual.' To which he replied: 'That's what I told you two and a half years ago at Br. [Breslau] when we went for that evening walk. But you wouldn't hear of it then.' It is painful to be requested in this way to surrender one's originality. I could not recall any such conversation or this pronouncement of my friend's. One of us must have been mistaken

1 [This paragraph was added in 1907.]

2 [Except where otherwise specified, the whole of what follows down to p. 130 dates back to 1901.]

3 [In 1901 and 1904 only: 'One day in the summer of this year I remarked to my friend Fl., with whom I have a lively exchange . . .' The friend was Wilhelm Fliess. The date of the conversation was not 1901 but 1900. This was in fact the last occasion on which the two men were together. A full account of the episode can be found in Jones, 1953, 344 ff. The present example was evidently written in the latter part of 1900 and afterwards erroneously dated.]

and on the '*cui prodest*?' principle[1] it must have been myself. Indeed, in the course of the next week I remembered the whole incident, which was just as my friend had tried to recall it to me; I even recollected the answer I had given him at the time: 'I've not accepted that yet; I'm not inclined to go into the question.' But since then I have grown a little more tolerant when, in reading medical literature, I come across one of the few ideas with which my name can be associated, and find that my name has not been mentioned.

Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in diagnosis, a rebuff by someone with similar interests, borrowing someone else's ideas – it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of *disowning* which we
[145] encounter in our medical work are to be traced to *forgetting*.[2] It is true

1 ['Who benefits?' – the traditional question the answer to which points to the person guilty of a crime.]

2 [*Footnote added* 1907:] If we ask someone whether he suffered from a luetic infection ten or fifteen years ago, we are too apt to overlook the fact that, from a psychical point of view, he will have regarded this illness quite differently from, let us say, an acute attack of rheumatism. – In the anamneses which parents give about their daughters' neurotic illnesses, it is hardly possible to distinguish with certainty between what has been forgotten and what is being concealed, since everything standing in the way of a girl's future marriage is systematically set aside, i.e. repressed, by the parents. – [*Added* 1910:] A man who had recently lost his dearly loved wife from an affection of the lungs reported the following instance to me in which misleading answers given to the doctor's enquiries could only be ascribed to forgetting of this kind. 'As my poor wife's pleuritis had still not improved after many weeks, Dr P. was called into consultation. In taking the anamnesis he asked the usual questions, including whether there were any cases of lung illness in my wife's family. My wife said there were none and I could not recall any either. As Dr P. was leaving, the conversation turned, as though accidentally, to the subject of excursions and my wife said: "Yes, it's a long journey, too, to Langersdorf, *where my poor brother's buried*." This brother died about fifteen years ago after suffering for years from tuberculosis. My wife was very fond of him and had often spoken to me about him. In fact it now occurred to me that at the time that her pleuritis was diagnosed she was very worried and remarked gloomily: "My brother died of a lung complaint too." But now, the memory was so strongly repressed that even after her remark about the excursion to Langersdorf she was not led to correct the information she had given about illnesses in her family. I myself became aware of the lapse of memory at the very moment she spoke of Langersdorf.' – [*Added* 1912:] A completely analogous experience is related by Jones in the work to which I have referred several times already [Jones, 1911*b*, 484]. A physician, whose wife suffered from an abdominal complaint the diagnosis of which was uncertain, remarked by way of comforting her: 'It is fortunate at any rate that there has been no tuberculosis in your family.' 'Have you forgotten', answered his wife in the greatest astonishment, 'that my mother died of tuberculosis and that my sister recovered from it only after having been given up by the doctors?'

that our view of such forgetting limits the distinction between the two forms of behaviour [disowning and forgetting] to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his [146] brothers and sisters, he had been a bedwetter till late on – a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bedwetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.[1]

There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance.[2] But the full

1 In the days while I was engaged in writing these pages the following almost incredible instance of forgetting happened to me. On the first of January I was going through my medical engagement book so that I could send out my accounts. Under the month of June I came across the name 'M——l' but could not recall who it belonged to. My bewilderment grew when I turned the pages and discovered that I treated the case in a sanatorium and made daily visits over a period of weeks. A patient treated under such conditions cannot be forgotten by a doctor after scarcely six months. Could it have been a man, I asked myself, a case of general paralysis, an uninteresting case? Finally the record of the fees I had received brought back to me all the facts that had striven to escape my memory. M——l was a fourteen-year-old girl, the most remarkable case I had had in recent years, one which taught me a lesson I am not likely ever to forget and whose outcome cost me moments of the greatest distress. The child fell ill of an unmistakable hysteria, which did in fact clear up quickly and radically under my care. After this improvement the child was taken away from me by her parents. She still complained of abdominal pains which had played the chief part in the clinical picture of her hysteria. Two months later she died of sarcoma of the abdominal glands. The hysteria, to which she was at the same time predisposed, used the tumour as a provoking cause, and I, with my attention held by the noisy but harmless manifestations of the hysteria, had perhaps overlooked the first signs of the insidious and incurable disease.

2 [*Footnote added* 1910:] A. Pick (1905) has recently brought together a number of quotations from authors who appreciate the influence of affective factors on the memory and who – more or less clearly – recognize the contribution towards forgetting made by the endeavour to fend off unpleasure. But none of us has been able to portray the phenomenon and its psychological basis so exhaustively and at the same time so impressively as Nietzsche in one of his aphorisms (*Jenseits von Gut und Böse*, IV, 68): "'I did this", says my Memory. "I cannot have done this", says my Pride and remains inexorable. In the end – Memory yields.' [Freud had had his attention drawn to this saying by the 'Rat Man', whose case history was published very shortly before the date of this footnote (1909*d*), *RSE*, **10**, 141.]

[147] significance of this fact can be estimated only when the psychology of *neurotic* people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an *elementary endeavour* of this kind *to fend off* [*Abwehrbestreben*][T] ideas that *Abwehr* can arouse feelings of unpleasure – an endeavour which can only be compared with the flight reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that *the architectonic principle of the mental apparatus lies in a stratification – a building up of superimposed agencies*; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power. As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

The view developed here, that distressing memories succumb especially easily to motivated forgetting, deserves to find application in many spheres where no attention, or too little, has so far been paid to it. Thus it seems to me that it has still not yet been sufficiently strongly emphasized in assessing testimony in courts of law,[1] where the process of putting [148] a witness on oath is clearly expected to have much too great a purifying influence on the play of his psychical forces. It is universally acknowledged that where the origin of a people's traditions and legendary history are concerned, a motive of this kind, whose aim is to wipe from memory whatever is distressing to national feeling, must be taken into consideration.[2] Closer investigation would perhaps reveal a complete analogy between the ways in which the traditions of a people and the childhood memories of the individual come to be formed. – The great

1 Cf. Gross (1898). [See footnote 5, p. 218 below.]

2 [Cf. above, p. 42.]

Darwin[1] laid down a 'golden rule' for the scientific worker based on his insight into the part played by unpleasure as a motive for forgetting.[2]

In a very similar way to the forgetting of names [p. 1 above], the forgetting of impressions can be accompanied by faulty recollection; and this, where it finds credence, is described as paramnesia. Paramnesia in pathological cases – in paranoia it actually plays the part of a constituent factor in the formation of the delusion – has brought forth an extensive literature in which I have entirely failed to find any hint whatever as to its motivation. As this is also a subject which belongs to the psychology of the neuroses it is inappropriate to consider it in the present context. Instead, I shall describe a singular paramnesia of my own, in which the motivation provided by unconscious, repressed material and the manner and nature of the connection with this material can be recognized clearly enough.

While I was writing the later chapters of my book on dream interpretation, I happened to be at a summer resort without access to libraries and works of reference, and I was forced to incorporate in my manuscript [149] from memory all sorts of references and quotations, subject to later correction. In writing the passage on daydreams[3] I thought of the excellent example of the poor bookkeeper in Alphonse Daudet's *Le Nabab*, in whose person the writer was probably portraying his own reveries. I imagined I had a distinct memory of one of the phantasies which this man – I called him Monsieur Jocelyn – hatched out on his walks through the streets of Paris; and I began to reproduce it from memory. It was a phantasy of how Monsieur Jocelyn boldly threw himself at the head of a runaway horse in the street, and brought it to a stop; how the carriage door opened and a great personage stepped out, pressed Monsieur Jocelyn's hand and said: 'You are my saviour. I owe my life to you. What can I do for you?'

Any inaccuracies in my own account of this phantasy could, I assured myself, easily be corrected at home when I had the book in front of me. But when I finally looked through *Le Nabab* to check this passage in my manuscript, which was ready to go to press, I found, to my very great

1 [This sentence was added in 1912.]

2 [*Footnote added* 1912:] Ernest Jones [1911*b*, 480] has drawn attention to the following passage in Darwin's autobiography [1958, 123], which convincingly reflects his scientific honesty and his psychological acumen:

'I had, during many years, followed a golden rule, namely, that whenever a published fact, a new observation or thought came across me, which was opposed to my general results, to make a memorandum of it without fail and at once; for I had found by experience that such facts and thoughts were far more apt to escape from the memory than favourable ones.'

3 [*The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 440 and 477 f.]

shame and consternation, no mention of any such reverie on the part of Monsieur Jocelyn; in fact, the poor bookkeeper did not have this name at all but was called Monsieur Joyeuse. This second error quickly gave me the key to the solution to the first one – the paramnesia, 'Joyeux', of which 'Joyeuse' is the feminine form, is the only possible way in which I could translate my own name, Freud, into French. Where then could the phantasy, which I had remembered wrongly and ascribed to Daudet, have come from? It could only be a product of my own, a daydream which I had formed myself and which had not become conscious or which had once been conscious and had since been totally forgotten. Perhaps I invented it myself in Paris where I frequently walked about the streets, lonely and full of longings, greatly in need of a helper and protector, until the great Charcot took me into his circle. Later I more than once met the author of *Le Nabab* in Charcot's house.[1]

[150] Another paramnesia,[2] which it was possible to explain satisfactorily, is reminiscent of *fausse reconnaissance*, a subject that will be discussed later [p. 227 ff. below]. I had told one of my patients, an ambitious and capable man, that a young student had recently gained admittance to the circle of my followers on the strength of an interesting work, *Der Künstler, Versuch einer Sexualpsychologie* [The Artist, an Attempt at a

1 [In all the editions before 1924 this paragraph continued: 'But the irritating part of it is that there is scarcely any group of ideas to which I feel so antagonistic as that of being someone's protégé. What can be seen in our country of this relation is enough to rob one of all desire for it, and the role of the favourite child is one which is very little suited indeed to my character. I have always felt an unusually strong urge "to be the strong man myself". And yet *I* had to be reminded of daydreams like this – which, incidentally, were never fulfilled. Over and above this, the incident is a good illustration of the way in which the relation to one's own self, which is normally kept back, but which emerges victoriously in paranoia, disturbs and confuses us in our objective view of things.']

[*Footnote added* 1924:] Some time ago one of my readers sent me a small volume from Franz Hoffmann's *Jugendbibliothek* [Library for Young People] in which a rescue scene like the one in my phantasy in Paris is recounted in detail. The agreement between the two extends even to certain not quite ordinary expressions that occur in both. It is not easy to avoid suspecting that I had in fact read this children's book while I was myself a boy. The library at my secondary school contained Hoffmann's series and was always ready to offer these books to pupils in place of any other mental pabulum. The phantasy which, at the age of 43, I thought I remembered as having been produced by someone else, and which I was subsequently forced to recognize as a creation of my own at the age of 28, may therefore easily have been an exact reproduction of an impression which I had received somewhere between the ages of 11 and 13. After all, the rescue phantasy which I attributed to the unemployed bookkeeper in *Le Nabab* was merely meant to prepare the way for the phantasy of my own rescue, to make my longing for a patron and protector tolerable to my pride. This being so, it will not surprise anyone with an understanding of the mind to hear that in my conscious life I myself was highly resistant to the idea of being dependent on a protector's favour, and that I found it hard to tolerate the few real situations in which something of that nature occurred. Abraham (1922*a*) has brought to light the deeper meaning of phantasies with such a content [rescue phantasies] and has provided an almost exhaustive explanation of their special features.

2 [The rest of this section was added in 1907.]

Sexual Psychology].[1] When this work appeared in print a year and a quarter later, my patient maintained that he could remember with certainty having read an announcement of this book somewhere (perhaps in a bookseller's prospectus) even before – a month or six months before – I [151]
had first mentioned it to him. This announcement, he said, had come into his mind at the time; and he further remarked that the author had changed the title: it no longer read '*Versuch*' but '*Ansätze zu einer Sexualpsychologie*' [Approach to a Sexual Psychology]. Careful enquiry of the author and a comparison of all the dates nevertheless showed that my patient was claiming to recall something impossible. No announcement of this work had appeared anywhere before publication, and certainly none a year and a quarter before it went to press. When I omitted to interpret this paramnesia, my patient produced a repetition of it of the same kind. He believed he had recently seen a work on agoraphobia in a bookshop window and was now looking through all the publishers' catalogues in order to get a copy. I was then able to explain to him why his efforts were bound to be fruitless. The work on agoraphobia existed only in his phantasy, as an unconscious intention: he meant to write it himself. His ambition to emulate the young man and become one of my followers on the strength of a similar scientific work was responsible for the first paramnesia and then for its repetition. Thereupon he recalled that the bookseller's announcement which had led him to make this false recognition dealt with a work entitled '*Genesis, das Gesetz der Zeugung*' [Genesis, the Law of Generation]. However, it was I who was responsible for the change in the title mentioned by him, for I could remember having myself been guilty of that inaccuracy – '*Versuch*' instead of '*Ansätze*' – in repeating the title.

(*B*) *The Forgetting of Intentions*[2]

No group of phenomena is better qualified than the forgetting of intentions for demonstrating the thesis that, in itself, lack of attention does not suffice to explain parapraxes. An intention is an impulse to perform an action: an impulse which has already found approval but whose execution is postponed to a suitable occasion. Now it can happen that during the interval thus created a change of such a kind occurs in the motives involved that the intention is not carried out; but in that case it is not forgotten: it is re-examined and cancelled. The *forgetting* of [152]

1 [This was the first work of Otto Rank (1907).]

2 [Except where otherwise specified, the whole of this section dates back to 1901.]

intentions, to which we are subject every day and in every possible situation, is *not* a thing that we are in the habit of explaining in terms of such a revision in the balance of motives. In general we leave it unexplained; or we try to find a psychological explanation by supposing that at the time when the intention was due to be carried out the attention necessary for the action was no longer at hand – attention which was, after all, an indispensable precondition for the coming into being of the intention and had therefore been available for the action at that time. Observation of our normal behaviour in regard to intentions leads us to reject this attempt at an explanation as being arbitrary. If I form an intention in the morning which is to be carried out in the evening, I may be reminded of it two or three times in the course of the day. It *need* not, however, become conscious at all throughout the day. When the time for its execution draws near, it suddenly springs to my mind and causes me to make the necessary preparations for the proposed action. If I am going for a walk and take a letter with me which has to be posted,[1] it is certainly not necessary for me, as a normal individual, free from neurosis, to walk all the way with it in my hand and to be continually on the look-out for a letterbox in which to post it; on the contrary, I am in the habit of putting it in my pocket, of walking along and letting my thoughts range freely, and I confidently expect that one of the first letterboxes will catch my attention and cause me to put my hand in my pocket and take out the letter. Normal behaviour after an intention has been formed coincides fully with the experimentally produced behaviour of people to whom what is described as a 'post-hypnotic suggestion at long range' has been given under hypnosis.[2] This phenomenon is usually described in the following way. The suggested intention slumbers on in the person concerned until the time for its execution approaches. Then it awakes and impels him to perform the action.

There are two situations in life in which even the layman is aware that forgetting – as far as intentions are concerned – cannot in any way claim
[153] to be considered as an elementary phenomenon not further reducible, but entitles him to conclude that there are such things as unavowed motives. What I have in mind are love relationships and military discipline. A lover who has failed to keep a rendezvous will find it useless to make excuses for himself by telling the lady that unfortunately he completely forgot about it. She will not fail to reply: 'A year ago you wouldn't have forgotten. You evidently don't care for me any longer.' Even if he

1 [In 1901 only: 'posted today'.]

2 Cf. Bernheim (1891, [130 ff.]) [which Freud translated (Freud, 1892*a*)].

should seize on the psychological explanation mentioned above [p. 132] and try to excuse his forgetfulness by pleading pressure of business, the only outcome would be that the lady, who will have become as sharp-sighted as a doctor is in psychoanalysis, would reply: 'How curious that business distractions like these never turned up in the past!'[1] The lady is not of course wanting to deny the possibility of forgetting; it is only that she believes, not without reason, that practically the same inference – of there being some reluctance present – can be drawn from unintentional forgetting as from conscious evasion.

Similarly, under conditions of military service, the difference between a failure to carry out orders which is due to forgetting and one which is deliberate is neglected on principle – and justifiably so. A soldier *must* not forget what military service orders him to do. If he *does* forget in spite of knowing the order, that is because the motives that drive him to carry out the military order are opposed by other, countermotives. A one-year volunteer[2] who at inspection tries to offer the excuse that he has *forgotten* to polish his buttons is sure to be punished. But this punishment is trifling in comparison to the one to which he would expose himself if he admitted to himself and his superiors that the motive for his failure to carry out orders was that 'I'm heartily sick of this wretched spit and polish'. For the sake of this saving of punishment – for reasons of economy, so to speak – he makes use of forgetting as an excuse, or it comes about as a compromise.

Both the service of women and military service demand that everything connected with them should be immune to forgetting. In this way they suggest the notion that, whereas in unimportant matters forgetting is permissible, in important matters it is a sign that one wishes to treat them as unimportant, i.e. to deny their importance.[3] This view, which takes psychical considerations into account, cannot in fact be rejected here. No-one forgets to carry out actions that seem to himself important, without incurring suspicion of being mentally disordered. Our investigation can therefore only extend to the forgetting of intentions [154]

1 [An actual example of a similar occurrence was related by Freud among his associations to the 'Botanical Monograph' dream in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 149–50.]

2 [Young men of higher social and educational standing in Austria who volunteered might have their term of military service reduced to one year.]

3 [*Footnote added* 1912:] In Bernard Shaw's play *Caesar and Cleopatra*, Caesar, as he is leaving Egypt, is worried for a time by the idea that there is something he has meant to do but has forgotten. Finally he remembers: he has forgotten to say goodbye to Cleopatra! This small detail is meant to illustrate – incidentally in complete contrast to the historical truth – how little Caesar cared for the young Egyptian princess. (From Jones, 1911*b*, 488 *n*.) [This is also quoted in Lecture III of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 48.]

of a more or less minor character; we cannot consider any intention as being *wholly* indifferent, for otherwise it would certainly never have been formed.

As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives – or, as one may say, to a *counterwill*.[1] In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the
[155] motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily be exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

Writing from a prisoner-of-war camp,[2] Lieutenant T. reports an instance of a forgetting of this kind, in which an intention that had in the first place been suppressed broke through in the form of 'counterwill' and led to an unpleasant situation:

'The most senior officer in a prisoner-of-war camp for officers was insulted by one of his fellow prisoners. To avoid further complications he

1 ['*Counterwill*' was a term that had been used by Freud in an early paper on treatment by hypnotism (1892–93*a*), *RSE*, **1**.]

2 [This example was added in 1920.]

wished to use the only authoritative measure at his disposal and have the officer removed and transferred to another camp. It was only on the advice of several friends that he decided – contrary to his secret wish – to abandon his plan and seek to satisfy his honour immediately, although this was bound to have a variety of disagreeable results. The same morning, as senior officer, he had to call the roll of the officers, under the supervision of the camp guard. He had known his fellow officers for quite a long time and had never before made any mistakes over this. This time he passed over the name of the man who had insulted him, with the result that when all the others had been dismissed this man alone was obliged to remain behind till the error was cleared up. The name that had been overlooked was perfectly plainly written in the middle of a sheet. The incident was regarded by one party as a deliberate insult, and by the other as an unfortunate accident that was likely to be misinterpreted. [156] Later on, however, after making the acquaintance of Freud's *Psychopathology of Everyday Life*, the chief actor in the episode was able to form a correct picture of what had occurred.'

The conflict between a conventional duty and the unavowed view which we privately take of it similarly provides an explanation for those cases in which we forget to carry out actions that we promised to do as a favour to someone. Here the regular result is that it is only the would-be benefactor who believes that forgetting has the power to act as an excuse; the person who asked the favour gives what is unquestionably the right answer: 'He is not interested in the matter, otherwise he would not have forgotten.' There are some people who are known as being forgetful in general, and who are for that reason excused their lapses in the same kind of way as short-sighted people who fail to greet us in the street.[1] These people forget all their small promises, and they fail to carry out any of the commissions they receive. In this way they show themselves unreliable in little things, and they demand that we should not take these minor offences amiss – that is, that we should not attribute them to their character but refer them to an organic idiosyncrasy.[2] I am not one

1 Women, with their subtler understanding of unconscious mental processes, are as a rule more apt to take offence when someone does not recognize them in the street and therefore fails to greet them, than to think of the most obvious explanations – namely that the offender is short-sighted, or was so engrossed in his thoughts that he did not notice them. They conclude that he would have seen them if he had 'set any store by them'.

2 [*Footnote added* 1910:] Ferenczi reports that he himself was once an 'absent-minded person' [*ein 'Zerstreuter'*] and that he was noted by acquaintances for the frequency and strangeness of his parapraxes. But, he says, the signs of this absent-mindedness have almost completely disappeared since he began treating patients by psychoanalysis and found himself obliged to turn his attention to the analysis of his own self as well. He thinks that one gives up these parapraxes in proportion as one learns to enlarge one's own responsibility. He therefore justly maintains that absent-mindedness is a condition which is dependent on unconscious complexes and which can

[157] of these people myself, and have had no opportunity of analysing the actions of a person of this kind, so that, by examining the choice of occasions for forgetting, I might discover its motivation. I cannot, however, help suspecting on the basis of analogy that in these cases the motive is an unusually large amount of unavowed contempt for other people which exploits the constitutional factor for its own ends.[1]

In other cases the motives for forgetting are less easy to discover, and when found arouse greater surprise. Thus, for instance, in former years I noticed that, out of a fairly large number of visits to patients, I only forgot those to non-paying patients or to colleagues. My shame at this discovery led me to adopt the habit of making a note beforehand in the morning of the visits I intended to make during the day. I do not know if other doctors have arrived at the same practice by the same road. But in this way we get some idea of what causes the so-called neurasthenic patient to jot down, in his notorious 'notes', the various things he wants to tell the doctor. The ostensible reason is that he has no confidence in the reproductive capacity of his memory. That is perfectly correct, but the scene usually[2] proceeds as follows. The patient has recounted his various complaints and enquiries in a very long-winded manner. After he has finished he pauses for a moment, then pulls out the jottings and adds apologetically: 'I've made some notes, as I can't remember things.' As a rule he finds that they contain nothing new. He repeats each point and answers it himself: 'Yes, I've asked about that already.' With the notes he is probably only demonstrating one of his symptoms: the frequency with which his intentions are disturbed through the interference of obscure motives.

I pass on to ailments that afflict the greater number of my healthy acquaintances as well as myself. I confess that – especially in former
[158] years – I was very apt to forget to return borrowed books, which I kept for long periods, and that it came about especially easily that I put off paying bills by forgetting them. One morning not long ago I left the tobacconist's where I had made my daily purchase of cigars without having paid for them. It was a most harmless omission, as I am well known

be cured by psychoanalysis. One day, however, he was blaming himself for having committed a technical error in a patient's psychoanalysis. That day all his former absent-minded habits reappeared. He stumbled several times as he walked along the street (a representation of his *faux pas* [false step – blunder] in the treatment), left his pocketbook at home, tried to pay a kreuzer too little for his tram fare, found his clothes were not properly buttoned, and so on.

1 [*Footnote added* 1912:] In this connection Ernest Jones [1911*b*, 483] observes: 'Often the resistance is of a general order. Thus a busy man forgets to post letters entrusted to him – to his slight annoyance – by his wife, just as he may "forget" to carry out her shopping orders.'

2 [This word was added in 1904.]

there and could therefore expect to be reminded of my debt next day. But my trivial act of negligence, my attempt to contract a debt, was certainly not unconnected with budgetary thoughts which had occupied my mind during the preceding day. Among the majority even of what are called 'respectable' people traces of divided behaviour can easily be observed where money and property are concerned. It may perhaps be generally true that the primitive greed of the suckling, who wants to take possession of every object (in order to put it into his mouth), has been only incompletely overcome by civilization and upbringing.[1]

I am afraid all the examples I have given up to now will seem merely commonplace. But after all it can only suit my aim if I come upon things that are familiar to everyone and that everyone understands in the same way, for my whole purpose is to collect everyday material and turn it to scientific use. I fail to see why the wisdom which is the precipitate of men's common experience of life should be refused inclusion among the acquisitions of science. The essential character of scientific work derives not from the special nature of its objects of study but from its stricter method of establishing the facts and its search for far-reaching correlations. [159]

Where intentions of some importance are concerned, we have found in general that they are forgotten when obscure motives rise against them. In the case of rather less important intentions we can recognize a second mechanism of forgetting: a counterwill is transferred to the intention from some other topic, after an external association has been

1 For the sake of preserving the unity of the subject [of money] I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life – for fun, in fact – as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character – that is, if we are not thinking of his *manifest* character. [In all the editions before 1924 this last clause ran: 'if we are ready to add: his suppressed character.'] – If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. – In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms – as an expression of a counterwill against paying out money. – [*The next sentence was added in* 1912:] Brill [1912] puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' – The fact that women in particular evince a special amount of unpleasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing – 'for the sake of their *beaux yeux*'. They pay one, as it were, by the sight of their countenance.

formed between the other topic and the content of the intention. Here is an example. I set store by high-quality blotting paper ['*Löschpapier*'] and I decided one day to buy a fresh supply that afternoon in the course of my walk to the Inner Town.[1] But I forgot for four days running, till I asked myself what reason I had for the omission. It was easy to find after I had recalled that though I normally *write* '*Löschpapier*' I usually *say* '*Fliesspapier*' [another word for 'blotting paper']. 'Fliess' is the name of a friend in Berlin[2] who had on the days in question given me occasion for a worrying and anxious thought. I could not rid myself of this thought, but the defensive tendency (cf. above, p. 128) manifested itself by transferring itself, by means of the verbal similarity, to the indifferent intention which on account of its indifference offered little resistance.

Direct counterwill and more remote motivation are found together in the following example of dilatoriness. I had written a short pamphlet *On Dreams* (1901*a*), summarizing the subject matter of my *Interpretation of Dreams* [1900*a*], for the series *Grenzfragen des Nerven- und Seelenlebens* [Frontier Problems of Nervous and Mental Life]. Bergmann [the publisher] of Wiesbaden had sent me the proofs, and had asked for them back by return of post, as the book was to be issued before Christmas. I corrected the proofs the same night and placed them on my desk so as to take them with me next morning. In the morning I forgot about them, and only remembered them in the afternoon when I saw the wrapper on my desk. In the same way I forgot the proofs that afternoon, that evening and the following morning, till I pulled myself together and took them to a letterbox on the afternoon of the second day, wondering what could be the reason for my procrastination. It was obvious that I did not want to send them off, but I could not discover why. However, in the course of the same walk I called in at my publisher's in Vienna – the firm that had published my *Interpretation of Dreams*.[3] I placed an order for something and then said, as if impelled by a sudden thought: 'I suppose you know I've written the dream book over again?' – 'Oh, you can't mean that!' he said. 'Don't be alarmed', I replied; 'it's only a short essay for the Löwenfeld–Kurella series.' But he was still not satisfied; he was worried that the essay would interfere with the sales of the book. I disagreed with him and finally asked: 'If I'd come to you before, would you have forbidden my publishing it?' – 'No, I certainly wouldn't.' Personally I believe I acted quite within my rights and did nothing contrary to common practice; nevertheless it seems certain that a misgiving similar to that

[160]

1 [See footnote 3, p. 119 above.]

2 [In 1901 and 1904 only: . . . 'my friend in Berlin'.]

3 [Franz Deuticke.]

expressed by the publisher was the motive for my delay in sending back the proofs. This misgiving goes back to an earlier occasion, on which a different publisher raised difficulties when it seemed unavoidable for me to introduce unaltered a few pages from an earlier work of mine on children's palsies published by another firm, into my monograph on the same subject in Nothnagel's *Handbuch*.[1] But in this case, as well, the reproach was not justified; this time, too, I had loyally informed my first publisher (the same one who published *The Interpretation of Dreams*) of my intention. However, if this chain of memories is followed back still [161] further, it brings to light an even earlier occasion involving a translation from the French, in which I really did infringe the rights of property that apply to publications. I added notes to the text which I translated, without asking the author's permission, and some years later I had reason to suspect that the author was displeased with my arbitrary action.[2]

There is a proverb which reveals the popular knowledge that the forgetting of intentions is not accidental: 'If one forgets to do a thing once, one will forget to do it many times more.'

Indeed,[3] sometimes we cannot avoid an impression that everything that can be said about forgetting and about parapraxes is already familiar and self-evident to everyone. It is sufficiently surprising that it is nevertheless necessary to present to consciousness things that are so well known. How often have I heard people say: 'Don't ask me to do that, I'm certain to forget it!' There is surely nothing mystical, then, if this prophecy is subsequently fulfilled. A person who talks in this way senses an intention not to carry out the request, and is merely refusing to admit it to himself.

Much light is thrown, moreover, on the forgetting of intentions by what may be called 'the forming of spurious intentions'. I once promised a young author that I would write a review of his short work; but because of internal resistances, which I knew about, I put off doing so, till one day I yielded to pressure from him and promised it would be done that same evening. I really had seriously meant to do it then, but I had forgotten that I had set the evening aside for preparing a specialist report that could not be deferred. After this had shown me that my intention had been spurious, I gave up the struggle against my resistances and refused the author's request.

1 [Published by Hölder of Vienna (Freud, 1897*a*). He had written several earlier works on the subject, one of the more important of which (1893*b*, several times quoted in the later work) was published by Deuticke. The works in question appear in *NSW*, **3** and **2**, respectively.]

2 [This relates to a volume of lectures by Charcot which Freud translated (Freud, 1892–94*a*), and to which he added a large number of footnotes. See *RSE*, **1**, 165–70, and *NSW*, **4**.]

3 [This paragraph was added in 1910, and the final one in 1907.]

VIII
BUNGLED ACTIONS[1]

[162] I will quote another passage from the work by Meringer & Mayer (1895, 98) which I have already mentioned [p. 46 above]:[2]

'Slips of the tongue are not without their parallels. They correspond to the slips which often occur in other human activities and which are known by the somewhat foolish name of "oversights".'

Thus I am by no means the first to surmise that there is sense and purpose behind the minor functional disturbances in the daily life of healthy people.[3]

If slips in speaking – which is clearly a motor function – can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' to describe all the cases in which a wrong result – i.e. a deviation from what was intended – seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena.

It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'.[4] Let us rather try to trace
[163] the individual examples back to their particular determinants. For this

1 [*Das Vergreifen*. Except where otherwise indicated, the earlier part of this chapter (up to p. 145) dates back to 1901.]

2 [In the editions before 1910 the work was described as 'meritorious'.]

3 [*Footnote added* 1910:] A second publication by Meringer [1908] has later shown me how great an injustice I did to that author when I credited him with any such understanding.

4 [Ataxia is a neurological disorder characterized by incoordination and unsteadiness of voluntary movement, usually associated with pathology of the cerebellum and its connections. The term 'cortical ataxia' here seems to imply a higher form of the disorder, associated with the organ of ideas (cf. Freud, 1893*c*).]

purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

(*a*) In former years I visited patients in their homes more frequently than I do at present; and on numerous occasions when I was at the front door, instead of knocking or ringing the bell, I pulled my own latch-key out of my pocket, only to thrust it back again in some confusion. When I consider the patients at whose houses this happened, I am forced to think that the parapraxis – taking out my key instead of ringing the bell – was in the nature of a tribute to the house where I made the mistake. It was equivalent to the thought 'Here I feel I am at home', for it only occurred at places where I had taken a liking to the patient. (Of course, I never ring my own door bell.)

Thus the parapraxis was a symbolic representation of a thought which was not after all really intended to be accepted seriously and consciously; for a nerve specialist is in fact well aware that his patients remain attached to him only so long as they expect to be benefited by him, and that he in turn allows himself to feel an excessively warm interest in them only with a view to giving them psychical help.

Numerous self-observations made by other people[1] show that handling a key in this significantly incorrect way is certainly not a peculiarity of mine.

Maeder (1906) describes what is an almost identical repetition of my experiences: 'Il est arrivé à chacun de sortir son trousseau, en arrivant à la porte d'un ami particulièrement cher, de se surprendre pour ainsi dire, en train d'ouvrir avec sa clé comme chez soi. C'est un retard, puisqu'il faut sonner malgré tout, mais c'est une preuve qu'on se sent – ou qu'on voudrait se sentir – comme chez soi, auprès de cet ami.'[2]

Jones (1911*b*, 509): 'The use of keys is a fertile source of occurrences of [164]
this kind, of which two examples may be given. If I am disturbed in the midst of some engrossing work at home by having to go to the hospital to carry out some routine work, I am very apt to find myself trying to open the door of my laboratory there with the key of my desk at home, although the two keys are quite unlike each other. The mistake unconsciously demonstrates where I would rather be at the moment.

1 [This and the next four paragraphs were added in 1912.]

2 ['Everyone has had the experience of taking out his bunch of keys on reaching the door of a particularly dear friend, of catching himself, as it were, in the act of opening it with his key just as if he was at home. This causes a delay, as he has to ring the bell in the long run, but it is a sign that he feels – or would like to feel – at home with this friend.']

'Some years ago I was acting in a subordinate position at a certain institution, the front door of which was kept locked, so that it was necessary to ring for admission. On several occasions I found myself making serious attempts to open the door with my house key. Each one of the permanent visiting staff, to which I aspired to be a member, was provided with a key, to avoid the trouble of having to wait at the door. My mistakes thus expressed my desire to be on a similar footing, and to be quite "at home" there.'

Dr Hanns Sachs reports a similar experience: 'I always have two keys on me, one for the door of my office and one for my flat. They are not at all easily confused with each other, for the office key is at least three times as big as the flat key. Moreover, I carry the former in my trouser pocket and the latter in my waistcoat pocket. Nevertheless, it often happened that I noticed as I stood at the door that I had got out the wrong key on the stairs. I determined to make a statistical experiment. Since I stood in front of both the doors every day in more or less the same emotional state, the confusion between the two keys was bound to show a regular tendency, if, indeed, it was true that it had some psychical determinant. My observation of later instances then showed that I quite regularly took out my flat key at the door of the office, whereas the opposite happened only once. I came home tired, knowing that a guest would be waiting for me there. When I reached the door I made an attempt to unlock it with the office key – which was of course much too large.'

(*b*) There is a house where twice every day for six years, at regular hours, I used to wait to be let in outside a door on the second floor.[1] During this
[165] long period it has happened to me on two occasions, with a short interval between them, that I have gone a floor too high – i.e. I have '*climbed too high*'.[2] On the first occasion I was enjoying an ambitious daydream in which I was 'climbing ever higher and higher'. On this occasion I even failed to hear that the door in question had opened as I put my foot on the first step of the third flight. On the other occasion, I again went too far while I was deep in thought; when I realized it, I turned back and tried to catch hold of the phantasy in which I had been absorbed. I found that I was irritated by a (phantasied) criticism of my writings in which I was reproached with always 'going too far'. This I had now replaced with the not very respectful expression 'climbing too high'.

1 [Cf. below, p. 153.]

2 [The German '*versteigen*' would, on the analogy of '*verlesen*', '*verschreiben*', etc., mean 'to misclimb'; but its normal meaning is 'to climb too high' or, figuratively, 'to overreach oneself'.]

(*c*) For many years a reflex hammer and a tuning fork have been lying side by side on my writing table. One day I left in a hurry at the end of my consulting hour as I wanted to catch a particular suburban train; and in broad daylight I put the tuning fork in my coat pocket instead of the hammer. The weight of the object pulling down my pocket drew my attention to my mistake. Anyone who is not in the habit of giving consideration to such minor occurrences will doubtless explain and excuse the mistake by pointing to the haste of the moment. Nevertheless, I preferred to ask myself the question why it actually was that I took the tuning fork instead of the hammer. My haste could just as well have been a motive for picking up the right object so as not to have to waste time in correcting my mistake.

'Who was the last person to take hold of the tuning fork?' was the question that sprang to my mind at that point. It was an *imbecile* child, whom I had been testing some days before for his attention to sensory impressions; and he had been so fascinated by the tuning fork that I had had some difficulty in tearing it away from him. Could the meaning be, then, that I was an imbecile? It certainly seemed so, for my first association to 'hammer' was '*Chamer*' (Hebrew for 'ass').

But why this abusive language? At this point we must look into the situation. I was hurrying to a consultation at a place on the Western [166] railway line, to visit a patient who, according to the anamnesis I had received by letter, had fallen from a balcony some months earlier and had since then been unable to walk. The doctor who called me in wrote that he was nevertheless uncertain whether it was a case of spinal injury or of a traumatic neurosis – hysteria. That was what I was now to decide. It would therefore be advisable for me to be particularly wary in the delicate task of making a differential diagnosis. As it is, my colleagues are of the opinion that I make a diagnosis of hysteria far too carelessly where graver things are in question. But so far this did not justify the abusive language. Why, of course! it now occurred to me that the little railway station was at the same place at which some years before I had seen a young man who had not been able to walk properly after an emotional experience. At the time I made a diagnosis of hysteria and I subsequently took the patient on for psychical treatment. It then turned out that though my diagnosis had not, it is true, been incorrect, it had not been correct either. A whole number of the patient's symptoms had been hysterical, and they rapidly disappeared in the course of treatment. But behind these a remnant now became visible which was inaccessible to my therapy; this remnant could only be accounted for by multiple sclerosis.

It was easy for those who saw the patient after me to recognize the organic affection. I could hardly have behaved otherwise or formed a different judgement, yet the impression left was that a grave error had been made; the promise of a cure which I had given him could naturally not be kept.

The error of picking up the tuning fork instead of the hammer could thus be translated into words as follows: 'You idiot! You ass! Pull yourself together this time, and see that you don't diagnose hysteria again where there's an incurable illness, as you did years ago with the poor man from that same place!' And fortunately for this little analysis, if not fortunately for my mood, the same man, suffering from severe spastic paralysis, had visited me during my consulting hour a few days before, and a day after the imbecile child.

It will be observed that this time it was the voice of self-criticism which was making itself heard in the bungled action [*Fehlgreifen*]. A bungled
[167] action is quite specially suitable for use in this way as a self-reproach: the present mistake seeks to represent the mistake that has been committed elsewhere.

(*d*) Bungled actions can, of course, also serve a whole number of other obscure purposes. Here is a first example. It is very rare for me to break anything. I am not particularly dexterous but a result of the anatomical integrity of my neuromuscular apparatus is that there are clearly no grounds for my making clumsy movements of this kind, with their unwelcome consequences. I cannot therefore recall any object in my house that I have ever broken. Shortage of space in my study has often forced me to handle a number of pottery and stone antiquities (of which I have a small collection) in the most uncomfortable positions, so that onlookers have expressed anxiety that I should knock something down and break it. That however has never happened. Why then did I once[1] dash the marble cover of my plain inkpot to the ground so that it broke?

My inkstand is made out of a flat piece of Untersberg marble which is hollowed out to receive the glass inkpot; and the inkpot has a cover with a knob made of the same stone. Behind this inkstand there is a ring of bronze statuettes and terra cotta figures. I sat down at the desk to write, and then moved the hand that was holding the penholder forward in a remarkably clumsy way, sweeping on to the floor the inkpot cover which was lying on the desk at the time.

1 [In 1901 and 1904 only: 'recently'.]

The explanation was not hard to find. Some hours before, my sister had been in the room to inspect some new acquisitions. She admired them very much, and then remarked: 'Your writing table looks really attractive now; only the inkstand doesn't match. You must get a nicer one.' I went out with my sister and did not return for some hours. But when I did I carried out, so it seems, the execution of the condemned inkstand. Did I perhaps conclude from my sister's remark that she intended to make me a present of a nicer inkstand on the next festive occasion, and did I smash the unlovely old one so as to force her to carry out the intention she had hinted at? If that is so, my sweeping movement was only apparently clumsy; in reality it was exceedingly adroit and well directed, and understood how to avoid damaging any of the more precious objects that stood around. [168]

It is, in fact, my belief that we must accept this judgement for a whole series of seemingly accidental clumsy movements. It is true that they make a show of something violent and sweeping, like a spastic-atactic movement, but they prove to be governed by an intention and achieve their aim with a certainty which cannot in general be credited to our conscious voluntary movements. Moreover, they have both features – their violence and their unerring aim – in common with the motor manifestations of the hysterical neurosis, and partly, too, with the motor performances of somnambulism.[1] This fact indicates that both in these cases and in the movements under consideration the same unknown modification of the innervatory process is present.

Another self-observation,[2] reported by Frau Lou Andreas-Salomé, may give a convincing demonstration of how obstinate persistence in an act of 'clumsiness' serves unavowed purposes in a far from clumsy way:

'Just at the time when milk had become scarce and expensive I found that I let it boil over time and time again, to my constant horror and vexation. My efforts to get the better of this were unsuccessful, though I cannot by any means say that on other occasions I have proved absent-minded or inattentive. I should have had more reason to be so after the death of my dear white terrier (who deserved his name of "Druzhok" – the Russian for "Friend!" – as much as any human being ever did). But – lo and behold! – never since his death has even a drop of milk boiled over. My first thought about this ran: "That's lucky, for the milk spilt over on to the hearth or floor wouldn't even be of any use!" And in the

1 [Freud returned to the notion of 'somnambulistic certainty' at the end of this book, p. 215 below. In later editions it reappeared in two examples quoted by him, pp. 122 and 124 above.]

2 [This example was added in 1919.]

same moment I saw my "Friend" before my eyes, sitting eagerly watching the cooking, his head cocked a little to one side, his tail wagging expectantly, waiting in trustful confidence for the splendid mishap that was about to occur. And now everything was clear to me, and I realized too that I had been even *more* fond of him than I myself was aware.'

[169] In the last few years,[1] during which I have been collecting such observations, I have had a few more experiences of smashing or breaking objects of some value, but the investigation of these cases has convinced me that they were never the result of chance or of unintentional clumsiness on my part. One morning, for example, when I was passing through a room in my dressing-gown with straw slippers on my feet, I yielded to a sudden impulse and hurled one of my slippers from my foot at the wall, causing a beautiful little marble Venus to fall down from its bracket. As it broke into pieces, I quoted quite unmoved these lines from Busch:

> 'Ach! die Venus ist perdü –
> Klickeradoms! – von Medici!'[2]

This wild conduct and my calm acceptance of the damage are to be explained in terms of the situation at the time. One of my family was gravely ill,[3] and secretly I had already given up hope of her recovery. That morning I had learnt that there had been a great improvement, and I know I had said to myself: 'So she's going to live after all!' My attack of destructive fury served therefore to express a feeling of gratitude to fate and allowed me to perform a '*sacrificial act*' – rather as if I had made a vow to sacrifice something or other as a thank-offering if she recovered her health! The choice of the Venus of Medici for this sacrifice was clearly only a gallant act of homage towards the convalescent; but even now it is a mystery to me how I made up my mind so quickly, aimed so accurately and avoided hitting anything else among the objects so close to it.

Another case of breaking something, for which I once again made use of a penholder that slipped from my hand, likewise had the significance of a sacrifice; but on this occasion it took the form of a propitiatory sacrifice to avert evil. I had once seen fit to reproach a loyal and deserving

1 [This paragraph and the four following ones were added in 1907.]

2 ['Oh! the Venus! Lost is she!
Klickeradoms! of Medici!'
From Wilhelm Busch's *Die fromme Helene*, Chapter VIII.]

3 [This refers to the illness of Freud's eldest daughter in 1905. (Jones, 1957, 409.) Cf. also p. 155 below.]

friend on no other grounds than the interpretation I placed on certain indications coming from his unconscious. He was offended and wrote [170]
me a letter asking me not to treat my friends psychoanalytically. I had to admit he was in the right, and wrote him a reply to pacify him. While I was writing this letter I had in front of me my latest acquisition, a handsome glazed Egyptian figure. I broke it in the way I have described, and then immediately realized that I had caused this mischief in order to avert a greater one. Luckily it was possible to cement both of them together – the friendship as well as the figure – so that the break would not be noticed.

A third breakage was connected with less serious matters; it was only the disguised 'execution' – to borrow an expression from Vischer's *Auch Einer*[1] – of an object which no longer enjoyed my favour. For some time I used to carry a stick with a silver handle. On one occasion the thin metal got damaged, through no fault of mine, and was badly repaired. Soon after the stick came back, I used the handle in a mischievous attempt to catch one of my children by the leg – with the natural result that it broke, and I was thus rid of it.

The equanimity with which we accept the resulting damage in all these cases can no doubt be taken as evidence that there is an unconscious purpose behind the performance of these particular actions.

In investigating the reasons for the occurrence of even so trivial a parapraxis as the breaking of an object,[2] one is liable to come across connections which, besides relating to a person's present situation, lead deep into his prehistory. The following analysis by Jekels (1913*a*) may serve as an example:

'A doctor had in his possession an earthenware flower vase which, though not valuable, was of great beauty. It was among the many presents – including objects of value – which had been sent to him in the past by a (married) woman patient. When a psychosis became manifest in her, he restored all the presents to her relatives – except for this far less expensive vase, with which he could not bear to part, ostensibly because [171]
it was so beautiful. But this embezzlement cost a man of his scrupulousness a considerable internal struggle. He was fully aware of the impropriety of his action, and only managed to overcome his pangs of conscience by telling himself that the vase was not in fact of any real

1 [Theodor Vischer (1807–87), the author of this novel (1878), was a Professor of Aesthetics, who is repeatedly quoted in Freud's book on *Jokes* (1905*c*), *RSE*, **8**. The novel, as well as another of Vischer's lighter works, is referred to again in 'On Psychotherapy' (1905*a*), ibid., **7**, 269 and 276. See also above, p. 122 *n*. 1.]

2 [This paragraph and the example which follows were added in 1917.]

value, that it was too awkward to pack, etc. – Some months later he was on the point of getting a lawyer to claim and recover the arrears (which were in dispute) of the fees for the treatment of this same patient. Once again the self-reproaches made their appearance; and he suffered some momentary anxiety in case the relatives discovered what could be called his embezzlement and brought it against him during the legal proceedings. For a while indeed the first factor (his self-reproaches) was so strong that he actually thought of renouncing all claims on a sum of perhaps a hundred times the value of the vase – a compensation, as it were, for the object he had appropriated. However, he at once got the better of the notion and set it aside as absurd.

'While he was still in this mood he happened to be putting some fresh water in the vase; and despite the extreme infrequency with which he broke anything and the good control that he had over his muscular apparatus, he made an extraordinarily "clumsy" movement – one that was not in the least organically related to the action he was carrying out – which knocked the vase off the table, so that it broke into some five or six largish pieces. What is more, this was after he had made up his mind on the previous evening, though not without considerable hesitation, to put precisely this vase, filled with flowers, on the dining-room table before his guests. He had remembered it only just before it got broken, had noticed with anxiety that it was not in his living room and had himself brought it in from the other room. After his first moments of dismay he picked up the pieces and by putting them together was just deciding that it would still be possible to make an almost complete repair of the vase, when the two or three larger fragments slipped from his hand; they broke into a thousand splinters, and with that vanished all hope for the vase.

'There is no doubt that this parapraxis had the current purpose of assisting the doctor in his law-suit, by getting rid of something which he
[172] had kept back and which to some extent prevented his claiming what had been kept back from him.

'But apart from this direct determinant, every psychoanalyst will see in the parapraxis a further and much deeper and more important *symbolic* determinant; for a vase is an unmistakable symbol of a woman.

'The hero of this little story had lost his young, beautiful and dearly loved wife in a tragic manner. He fell ill of a neurosis whose main theme was that he was to blame for the misfortune ("he had broken a lovely vase"). Moreover, he had no further relations with women and took a dislike to marriage and lasting love relationships, which unconsciously he thought of as being unfaithful to his dead wife but which he

consciously rationalized in the idea that he brought misfortune to women, that a woman might kill herself on his account, etc. (Hence his natural reluctance to keep the vase permanently!)

'In view of the strength of his libido it is therefore not surprising that the most adequate relationships appeared to him to be those – transient from their very nature – with married women (hence his keeping back of another person's vase).

'This symbolism is neatly confirmed by the two following factors. Because of his neurosis he entered psychoanalytic treatment. In the course of the session in which he gave an account of breaking the "earthenware" vase, he happened much later to be talking once more about his relations with women and said he thought he was quite unreasonably hard to please; thus for example he required women to have "unearthly beauty". This is surely a very clear indication that he was still dependent on his (dead, i.e. unearthly) wife and wanted to have nothing to do with "earthly beauty"; hence the breaking of the earthenware ("earthly") vase.

'And at the exact time when in the transference he formed a phantasy of marrying his physician's daughter, he made him a present of a vase, as though to drop a hint of the sort of return present he would like to have.

'Probably the symbolic meaning of the parapraxis admits of a number of further variations – for example, his not wanting to fill the vase, etc. What strikes me, however, as more interesting is the consideration that the presence of several, at the least of two, motives (which probably [173] operated separately out of the preconscious and the unconscious) is reflected in the doubling of the parapraxis – his knocking over the vase and then letting it fall from his hands.'[1]

(*e*)[2] Dropping, knocking over and breaking objects are acts which seem to be used very often to express unconscious trains of thought, as analysis can occasionally demonstrate, but as may more frequently be guessed from the superstitious or facetious interpretations popularly connected with them. The interpretations attached to salt being spilt, a wine-glass being knocked over, a dropped knife sticking in the ground, etc., are well known. I shall not discuss till later [p. 218 ff. below] the question of what claims such superstitious interpretations have to being taken seriously. Here I need only remark that individual clumsy

1 [Cf. p. 91 (*b*) above.]

2 [The first and third paragraphs in this section date back to 1901; the second was added in 1910.]

actions do not by any means always have the same meaning, but serve as a method of representing one purpose or another according to circumstances.

Recently we passed through a period in my house during which an unusually large amount of glass and china crockery was broken; I myself was responsible for some of the damage. But the little psychical epidemic could easily be explained; these were the days before my eldest daughter's wedding. On such festive occasions it used to be the custom deliberately to break some utensil and at the same time utter a phrase to bring good luck. This custom may have the significance of a sacrifice and it may have another symbolic meaning as well.

When servants drop fragile articles and so destroy them, our first thought is certainly not of a psychological explanation, yet it is not unlikely that here, too, obscure motives play their part. Nothing is more foreign to uneducated people than an appreciation of art and works of art. Our servants are dominated by a mute hostility towards the manifestations of art, especially when the objects (whose value they do not understand) become a source of work for them. On the other hand, people of the same education and origin often show great dexterity and
[174] reliability in handling delicate objects in scientific institutions, once they have begun to identify themselves with their chief and to consider themselves an essential part of the staff.

I insert here[1] a communication from a young technician which gives us some insight into the mechanism of a case of material damage:

'Some time ago I worked with several fellow students in the laboratory of the technical college on a series of complicated experiments in elasticity, a piece of work which we had undertaken voluntarily but which was beginning to take up more time than we had expected. One day as I returned to the laboratory with my friend F., he remarked how annoying it was to him to lose so much time on that particular day as he had so much else to do at home. I could not help agreeing with him and added half-jokingly, referring to an incident the week before: "Let us hope that the machine will go wrong again so that we can stop work and go home early." – In arranging the work it happened that F. was given the regulation of the valve of the press; that is to say, he was, by cautiously opening the valve, to let the fluid under pressure flow slowly out of the accumulator into the cylinder of the hydraulic press. The man conducting the experiment stood by the manometer and when the right pressure was reached called out a loud "Stop!" At the word of command F. seized the

1 [This example, which was later quoted by Freud in Lecture IV of his *Introductory Lectures* (1916–17*a*), was added in 1912; *RSE*, **15**, 69.]

valve and turned it with all his might – to the left! (All valves without exception are closed by being turned to the right.) This caused the full pressure of the accumulator to come suddenly on to the press, a strain for which the connecting pipes are not designed, so that one of them immediately burst – quite a harmless accident to the machine, but enough to oblige us to suspend work for the day and go home. – It is characteristic, by the way, that when we were discussing the affair some time later my friend F. had no recollection whatever of my remark, which I recalled with certainty.'

Similarly,[1] falling, stumbling and slipping need not always be interpreted as purely accidental miscarriages of motor actions. The double meanings that language attaches to these expressions are enough to indicate the kind of phantasies involved, which can be represented by such [175]
losses of bodily equilibrium. I can recall a number of fairly mild nervous illnesses in women and girls which set in after a fall not accompanied by any injury, and which were taken to be traumatic hysterias resulting from the shock of the fall. Even at that time I had an impression that these events were differently connected and that the fall was already a product of the neurosis and expressed the same unconscious phantasies with a sexual content, which could be assumed to be the forces operating behind the symptoms. Is not the same thing meant by a proverb which runs: 'When a girl falls she falls on her back'?

We can also count[2] as bungled actions cases of giving a beggar a gold piece instead of a copper or small silver coin. The explanation of such mistakes is easy. They are sacrificial acts designed to appease fate, to avert harm, and so on. If a devoted mother or aunt, directly before going for a walk in the course of which she displays unwilling generosity of this kind, is heard to express concern over a child's health, we can have no more doubts about the meaning of the apparently disagreeable accident. In this way our parapraxes make it possible for us to practise all those pious and superstitious customs that must shun the light of consciousness owing to opposition from our reason, which has now grown sceptical.

(*f*) There is no sphere[3] in which the view that accidental actions are really intentional will command a more ready belief than that of sexual activity, where the borderline between the two possibilities seems really to be a faint one. A good example from my own experience of a few years ago shows how an apparently clumsy movement can be most cunningly

1 [This paragraph dates back to 1901.]

2 [Added in 1907.]

3 [This paragraph and the following one date back to 1901.]

used for sexual purposes. In the house of some friends I met a young girl who was staying there as a guest and who aroused a feeling of pleasure in me which I had long thought was extinct. As a result I was in a jovial, talkative and obliging mood. At the time I also endeavoured to discover how this came about; a year before, the same girl had made no impression on me. As the girl's uncle, a very old gentleman, entered the room, we both jumped to our feet to bring him a chair that was standing
[176] in the corner. She was nimbler than I was and, I think, nearer to the object; so she took hold of the chair first and carried it in front of her with its back towards her, gripping the sides of the seat with both hands. As I got there later, but still stuck to my intention of carrying the chair, I suddenly found myself standing directly behind her, and throwing my arms round her from behind; and for a moment my hands met in front of her waist. I naturally got out of the situation as rapidly as it had arisen. Nor does it seem to have struck anyone how dexterously I had taken advantage of this clumsy movement.

Occasionally, too, I have had to tell myself that the irritating and clumsy process of dodging someone in the street, when for several seconds[1] one steps first to one side and then to the other, but always to the same side as the other person, till finally one comes to a standstill face to face with him (or her) – this 'getting in someone's way', I have had to tell myself, is once more a repetition of an improper and provocative piece of behaviour from earlier times and, behind a mask of clumsiness, pursues sexual aims. I know from my psychoanalyses of neurotics that what is described as the naivety of young people and children is frequently only a mask of this sort, employed so that they may be able to say or do something improper without feeling embarrassed.

Wilhelm Stekel has reported very similar self-observations.[2] 'I entered a house and offered my right hand to my hostess. In a most curious way I contrived in doing so to undo the bow that held her loose morning-gown together. I was conscious of no dishonourable intention; yet I carried out this clumsy movement with the dexterity of a conjurer.'

I have already[3] been able again and again [cf. pp. 83 and 115 above] to produce evidence that creative writers think of parapraxes as having a meaning and a motive, just as I am arguing here. We shall not be surprised, therefore, to see from a fresh example how a writer invests a clumsy movement with significance, too, and makes it foreshadow later events.

1 [In 1901 only: 'for half a minute'.]

2 [Added in 1907.]

3 [This paragraph and the following one were added in 1917.]

Here is a passage from Theodor Fontane's novel *L'Adultera* [*The Adulteress*, 1882]. '. . . Melanie jumped up and threw one of the large balls to her husband as though in greeting. But her aim was not straight, [177] the ball flew to one side and Rubehn caught it.' On the return from the outing that led to this little episode a conversation between Melanie and Rubehn takes place which reveals the first signs of a budding affection. This affection blossoms into passion, so that Melanie finally leaves her husband and gives herself entirely to the man she loves. (Communicated by H. Sachs.)

(*g*)[1] The effects produced by the parapraxes of normal people are as a rule of the most harmless kind. Precisely for this reason it is an especially interesting question whether mistakes of considerable importance which may be followed by serious consequences – for example, mistakes made by a doctor or a chemist – are in any way open to the approach presented here. [Cf. also above, pp. 106–7.]

As I very rarely find myself undertaking medical treatment, I can report only one example from my personal experience of a bungled action of a medical kind. There is a very old lady whom I have been visiting twice a day for some years.[2] On my morning visit my medical services are limited to two actions. I put a few drops of eye lotion into her eye and give her a morphine injection. Two bottles are always prepared for me: a blue one with the collyrium and a white one with the morphine solution. During the two operations my thoughts are no doubt usually busy with something else; by now I have performed them so often that my attention behaves as if it were at liberty. One morning I noticed that the automaton had worked wrong. I had put the dropper into the white bottle instead of the blue one and had put morphine into the eye instead of collyrium. I was greatly frightened and then reassured myself by reflecting that a few drops of a two per cent solution of morphine could not do any harm even in the conjunctival sac. The feeling of fright must obviously have come from another source.

In attempting to analyse this small mistake I first thought of the phrase [178] 'sich an der Alten vergreifen',[3] which provided a shortcut to the solution. I was under the influence of a dream which had been told me by a young

1 [The first four paragraphs in this section date back to 1901.]

2 [This old lady, who is also alluded to on pp. 142 above and 220 below, appears as well in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 105 and 212. Her death is reported in a letter to Fliess of July 8, 1901 (Freud, 1950*a*, Letter 145).]

3 ['To do violence to the old woman.' The German word '*vergreifen*' means both 'to make a blunder' and 'to commit an assault'.]

man the previous evening and the content of which could only point to sexual intercourse with his own mother.[1] The strange fact that the [Oedipus] legend finds nothing objectionable in Queen Jocasta's age seemed to me to fit in well with the conclusion that in being in love with one's own mother one is never concerned with her as she is in the present but with her youthful mnemic image carried over from one's childhood. Such incongruities always appear when a phantasy that fluctuates between two periods is made conscious and so becomes definitely attached to one of the two periods. While absorbed in thoughts of this kind I came to my patient, who is over ninety, and I must have been on the way to grasping the universal human application of the Oedipus myth as correlated with the Fate which is revealed in the oracles; for at that point I did violence to or committed a blunder on 'the old woman'. Here again the bungled action was a harmless one; of the two possible errors, using the morphine solution for the eye or the eye lotion for the injection, I had chosen by far the more harmless one. This still leaves the question open of whether we may admit the possibility of an unconscious intention in mistakes that can cause serious harm, in the same way as in the cases which I have discussed.

Here then my material leaves me in the lurch, as might be expected, and I have to fall back on conjectures and inferences. It is well known that in the severer cases of psychoneurosis instances of self-injury are occasionally found as symptoms and that in such cases suicide can never be ruled out as a possible outcome of the psychical conflict. I have now learnt and can prove[2] from convincing examples that many apparently
[179] accidental injuries that happen to such patients are really instances of self-injury. What happens is that an impulse to self-punishment, which is constantly on the watch and which normally finds expression in self-reproach or contributes to the formation of a symptom, takes ingenious advantage of an external situation that chance happens to offer, or lends assistance to that situation until the desired injurious effect is brought about. Such occurrences are by no means uncommon in cases even of moderate severity, and they betray the part which the unconscious intention plays by a number of special features – e.g. by the striking composure that the patients retain in what is supposed to be an accident.[3]

1 The 'Oedipus dream', as I am in the habit of calling it, because it contains the key to the understanding of the legend of King Oedipus. In the text of Sophocles a reference to such a dream is put into Jocasta's mouth [line 982 ff.]. Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 231–4.

2 [In the editions before 1924 the sentence ran: 'and shall one day prove. . . .']

3 In the present state of our civilization self-injury which does not have total self-destruction as its aim has no other choice whatever than to hide itself behind something accidental or to manifest itself by imitating the onset of a spontaneous illness. Formerly self-injury was a customary sign of mourning; at other periods it could express trends towards piety and renunciation of the world.

Instead of a number of cases[1] I will give a detailed report of only a single example from my medical experience. A young married woman broke her leg below the knee in a carriage accident, so that she was bedridden for weeks; what was striking was the absence of any expressions of pain and the calmness with which she bore her misfortune. This accident introduced a long and severe neurotic illness of which she was finally cured by psychoanalysis. In treating her I learnt of the circumstances surrounding the accident and of certain events that had preceded it. The young woman was staying with her very jealous husband on the estate of a married sister, in company with her numerous other sisters and brothers with their husbands and wives. One evening in this intimate circle she showed off one of her accomplishments: she gave an accurate performance of the can-can, which was received with hearty applause by her relatives but with scanty satisfaction by her husband, who afterwards whispered to her: 'Carrying on like a tart again!' The remark struck home – we will not enquire whether it was only on account of the dancing display. She spent a restless night. Next morning she felt a desire to go for a drive. She selected the horses herself, refusing one pair and asking for another. Her youngest sister wanted her baby and its nurse to go in the carriage with her; my patient vigorously opposed this. During the [180]
drive she showed signs of nerves; she warned the coachman that the horses were growing skittish, and when the restless animals were really causing a moment's difficulty she jumped out in a fright and broke her leg, while the others who stayed in the carriage were unharmed. Although after learning these details we can hardly remain in doubt that this accident was really contrived, we cannot fail to admire the skill which forced chance to mete out a punishment that fitted the crime so well. For it had now been made impossible for her to dance the can-can for quite a long time.

As regards self-injuries of my own, there is little that I can report in uneventful times; but in extraordinary circumstances I find that I am not incapable of them. When a member of my family complains to me of having bitten his tongue, pinched a finger, or the like, he does not get the sympathy he hopes for, but instead the question: 'Why did you do that?' I myself once gave my thumb a most painful pinch when a youthful patient told me during the hour of treatment of his intention (not of course to be taken seriously) of marrying my eldest daughter – I knew that at the time she was lying critically ill in a sanatorium.[2]

1 [This paragraph and the next two were added in 1907.]

2 [See footnote 3, p. 146 above.]

One of my boys, whose lively temperament used to make it difficult to nurse him when he was ill, had a fit of anger one day because he was ordered to spend the morning in bed, and threatened to kill himself, a possibility that was familiar to him from the newspapers. In the evening he showed me a swelling on one side of his chest which he had got by bumping against a door handle. To my ironical question as to why he had done it and what he meant by it, the eleven-year-old child answered as though it had suddenly dawned on him: 'That was my attempt at suicide that I threatened this morning.' I do not think, by the way, that my views on self-injury were accessible to my children at the time.

Anyone who believes[1] in the occurrence of half-intentional self-*injury* – if I may use a clumsy expression – will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-*destruction* (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction [181] rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this drive and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

Even a *conscious* intention of committing suicide chooses its time, means and opportunity; and it is quite in keeping with this that an *unconscious* intention should wait for a precipitating occasion which can take over a part of the causation and, by engaging the subject's defensive forces, can liberate the intention from their pressure.[2] The views I am putting forward here are far from being idle ones. I have learnt of more than one apparently chance mishap (on horseback or in a carriage) the details of which justify a suspicion that suicide was unconsciously

1 [This paragraph and the next one date back to 1901.]

2 After all, the case is no different from that of a sexual assault upon a woman, where the man's attack cannot be repelled by her full muscular strength because a portion of her unconscious impulses meets the attack with encouragement. It is said, as we know, that a situation of this kind *paralyses* a woman's strength; all we need do is to add the reasons for this paralysis. To that extent the ingenious judgment delivered by Sancho Panza as governor of his island is psychologically unjust (*Don Quixote*, Part 2, Chapter 45). A woman dragged a man before the judge alleging he had robbed her of her honour by violence. In compensation Sancho gave her a full purse of money which he took from the accused; but after the woman's departure he gave him permission to pursue her and snatch his purse back again from her. The two returned struggling, the woman priding herself on the fact that the villain had not been able to take the purse from her. Thereupon Sancho declared: 'If you had defended your honour with half the determination with which you have defended this purse, the man could not have robbed you of it.'

allowed to come about. For example, an officer, riding in a race with some fellow officers, fell from his horse and was so severely injured that he died some days later. His behaviour on regaining consciousness was striking in some ways; and his previous behaviour had been even more remarkable. He had been deeply depressed by the death of his beloved mother, had had fits of sobbing in the company of his fellow officers, and to his trusted friends had spoken of being weary of life. He had wanted [182] to leave the service to take part in a war in Africa which had not interested him previously;[1] formerly a dashing rider, he now avoided riding whenever possible. Finally, before the race, from which he could not withdraw, he expressed gloomy forebodings; with the view that we hold in these matters, it will not remain a surprise to us that these forebodings turned out to be justified. I shall be told that it is not to be wondered at if a person in such a state of nervous depression cannot manage a horse as well as on normal days. I quite agree; but the mechanism of the motor inhibition produced by this state of 'nerves' should, I think, be looked for in the intention of self-destruction that I am insisting on.

S. Ferenczi of Budapest has handed over to me for publication the analysis of an ostensibly accidental injury by shooting,[2] which he explains as an unconscious attempt at suicide. I can only declare my agreement with his view of the matter:

'J. Ad., twenty-two years old, a journeyman carpenter, consulted me on January 18, 1908. He wanted to find out from me whether the bullet that penetrated his left temple on March 20, 1907 could or should be removed by operation. Apart from occasional, not too severe, headaches he felt perfectly well, and the objective examination revealed nothing at all apart from the characteristic powder-blackened bullet scar on the left temple, so I advised against an operation. When asked about the circumstances of the case he explained that he had injured himself accidentally. He was playing with his brother's revolver, *thought it was not loaded*, pressed it with his left hand against his *left* temple (he is not left-handed), put his finger on the trigger and the shot went off. *There were three bullets in the six-shooter*. I asked him how the idea of taking up the revolver came to him. He replied that it was the time of his medical examination for military service; the evening before, he took the weapon with him to the inn because he was afraid of brawls.

1 It is evident that conditions on a field of battle are such as to come to the help of a conscious intention to commit suicide which nevertheless shuns the direct way. Compare the words of the Swedish captain concerning the death of Max Piccolomini in [Schiller's] *Wallensteins Tod* [Act IV, Scene 11]: 'They say he wanted to die.'

2 [This example was added in 1910.]

[183] At the examination he was found unfit because of varicose veins; he was very ashamed of this. He went home and played with the revolver, but had no intention of hurting himself – and then the accident happened. When questioned further whether he was otherwise satisfied with life, he sighed in answer and told the story of his love for a girl who also loved him but left him all the same. She emigrated to America simply out of desire for money. He wanted to follow her, but his parents prevented him. His sweetheart left on January 20, 1907; two months, that is, before the accident. In spite of all these suspicious factors the patient stuck to his point that the shooting was an "accident". I was, however, firmly convinced that his negligence in failing to make sure the weapon was not loaded before playing with it, as well as his self-inflicted injury, were psychically determined. He was still labouring under the depressing effects of his unhappy love affair and obviously wanted to "forget it all" in the army. When he was deprived of this hope as well, he took to playing with the revolver – i.e. to an unconscious attempt at suicide. His holding the revolver in his left and not his right hand is strong evidence that he was really only "playing" – that is, he did not consciously wish to commit suicide.'

Another analysis[1] of an apparently accidental self-inflicted injury, which its observer (Van Emden, 1912) has passed on to me, recalls the proverb: 'He who digs a pit for others falls in it himself.'[2]

'Frau X., who comes of a good middle-class family, is married with three children. She suffers from her nerves, it is true, but has never needed any energetic treatment as she is sufficiently able to cope with life. One day she incurred a facial disfigurement which was somewhat striking at the time though it was only temporary. It happened as follows. She stumbled on a heap of stones in a street under repair and struck her face against the wall of a house. The whole of her face was scratched; her eyelids became blue and oedematous and as she was afraid that something might happen to her eyes she had the doctor called in. After she had been reassured on that score, I asked her: "But why did you in fact fall in that way?" She replied that, directly before this, she had warned her [184] husband, who had been suffering for some months from a joint affection and therefore had difficulty in walking, to take great care in that street, and it had been a fairly frequent experience of hers to find in cases of the kind that in some remarkable way the very thing happened to her that she had warned someone else against.

1 [Added in 1912.]

2 [Cf. *Ecclesiastes*, x, 8: 'He that diggeth a pit shall fall into it.']

'I was not satisfied that this was what had determined her accident and asked if perhaps she had something more to tell me. Yes, just before the accident she had seen an attractive picture in a shop on the other side of the street; she had quite suddenly desired it as an ornament for the nursery and therefore wanted to buy it immediately. She walked straight towards the shop, without looking at the ground, stumbled over the heap of stones and in falling struck her face against the wall of the house without making even the slightest attempt to shield herself with her hands. The intention of buying the picture was immediately forgotten and she returned home as fast as possible. – "But why didn't you keep a better look-out?" I asked. "Well," she answered, "perhaps it was a *punishment* – on account of that episode I told you about in confidence." – "Has it gone on worrying you so much then?" – "Yes – I regretted it very much afterwards; I considered myself wicked, criminal and immoral, but at the time I was almost crazy with my nerves."

'The reference was to an abortion which she had had carried out with her husband's consent, as, owing to their financial circumstances, the couple did not wish to be blessed with any further children. This abortion had been started by a woman quack but had had to be completed by a specialist.

'"I often reproach myself by thinking 'You really had your child killed' and I was afraid such a thing couldn't go unpunished. Now that you've assured me there's nothing wrong with my eyes, my mind's quite at rest: I've been *sufficiently punished* now in any case."

'This accident was therefore a self-punishment, firstly, to atone for her crime, but, secondly, also to escape from an unknown punishment of perhaps much greater severity of which she had been in continual dread for months. In the moment that she dashed towards the shop to buy the picture, the memory of the whole episode with all its fears, which had already been fairly strongly active in her unconscious when she had warned her husband, became overwhelming and might perhaps have been expressed in some words like these: "Why do *you* need an ornament for the nursery? – you had your child destroyed! You're a murderess. The great punishment's just coming down on you for certain!" [185]

'This thought did not become conscious; but instead of it she used the situation, at what I might call this psychological moment, for punishing herself unobtrusively with the help of the heap of stones which seemed suitable for the purpose. This is the reason why she did not even put out her hands as she fell and also why she was not seriously frightened. The

second and probably less important determinant of her accident was no doubt self-punishment for her *unconscious* wish to be rid of her husband, who, incidentally, had been an accomplice in the crime. This wish was betrayed by her entirely superfluous warning to him to keep an eye open for the heap of stones in the street, since her husband walked with great care precisely because he was bad on his legs.'[1]

When the details of the case are considered[2] one will also be likely to feel that Stärcke (1916) is right in regarding an apparently accidental self-injury by burning as a 'sacrificial act':

'A lady whose son-in-law had to leave for Germany for military service scalded her foot in the following circumstances. Her daughter was expecting her confinement soon and reflections on the perils of war naturally did not put the family into a very cheerful mood. The day before his departure she had asked her son-in-law and daughter in for a meal. She herself prepared the meal in the kitchen after having first – strangely enough – changed her high, laced boots with arch-supports, which were comfortable for walking and which she usually wore indoors as well, for a pair of her husband's slippers that were too large and were open at the top. While taking a large pan of boiling soup off the fire she
[186] dropped it and in this way scalded one foot fairly badly – especially the instep, which was not protected by the open slipper. – Everyone naturally put this accident down to her understandable "nerves". For the first few days after this burnt offering she was particularly careful with anything hot, but this did not prevent her some days later from scalding her wrist with hot gravy.'[3]

1 [*Footnote added* 1920:] A correspondent writes to me as follows on the subject of 'self-punishment by means of parapraxes': 'If one studies the way people behave in the street one has a chance of seeing how often men who turn round to look back at passing women – not an unusual habit – meet with a minor accident. Sometimes they will sprain an ankle – on a level pavement; sometimes they will bump into a lamp-post or hurt themselves in some other way.'

2 [Added in 1917.]

3 [*Footnote added* 1924:] In a very large number of cases like these of injury or death in accidents the explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything other than a chance occurrence, while someone who is closely connected with the victim and is familiar with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The following account by a young man whose fiancée was run over in the street gives a good example of the kind of intimate knowledge that I mean and of the type of accessory details in question:

'Last September I made the acquaintance of a Fräulein Z., aged 34. She was in well-to-do circumstances, and had been engaged before the war, but her fiancé had fallen in action in 1916 while serving as an officer. We came to know and become fond of each other, not at first with any thought of marrying, as the circumstances on both sides, in particular the difference in our ages (I myself was 27), seemed to rule that out. As we lived opposite each other in the same street and met every day, our relationship took an intimate turn in course of time. Thus the idea of marriage came more into view and I finally agreed to it myself. The betrothal was planned for this Easter; Fräulein Z., however, intended first to make a journey to her relatives at M., but this was suddenly

If a furious raging[1] against one's own integrity and one's own life can [187]
be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could [188]
not, as he himself admitted, be completely accounted for in that way. He

prevented by a railway strike that had been called as a result of the Kapp Putsch [an attempted counterrevolutionary *coup d'état* in Berlin in March, 1920]. The gloomy prospects that the workers' victory and its consequences appeared to hold out for the future had their effect for a brief time on our mood, too, but especially on Fräulein Z., always a person of very changeable moods, since she thought she saw new obstacles in the way of our future. On Saturday, March 20, however, she was in an exceptionally cheerful frame of mind – a state of affairs that took me quite by surprise and carried me along with her, so that we seemed to see everything in the rosiest colours. A few days before, we had talked of going to church together some time, without however having fixed a definite date. At 9.15 the next morning, Sunday, March 21, she telephoned to ask me to fetch her to church straight away; but I refused, as I could not have got ready in time, and had, besides, work I wanted to finish. Fräulein Z. was noticeably disappointed; she then set out alone, met an acquaintance on the stairs at her house and walked with him for the short distance along the Tauentzienstrasse to the Rankestrasse, in the best of humour and without referring at all to our conversation. The gentleman bade her goodbye with a joking remark. [In order to reach the church] Fräulein Z. had only to cross the Kurfürstendamm [the main street in West Berlin] where it widened out and one could have a clear view along it; but, close to the pavement, she was run over by a horse-drawn cab. (Contusion of the liver, which led to her death a few hours later.) – We had crossed at that point hundreds of times before; Fräulein Z. was exceedingly careful, and very often prevented me from being rash; on this morning there was almost no traffic whatever, the trams, omnibuses, etc. were on strike. Just about that time there was almost *absolute quiet*; even if she did not see the cab she must at all events have heard it! Everybody supposed it was an "accident". My first thought was: "That's impossible – but on the other hand there can be no question of its having been intentional." I tried to find a psychological explanation. After some considerable time I thought I had found it in your *Psychopathology of Everyday Life*. In particular, Fräulein Z. showed at various times a certain leaning in the direction of suicide and even tried to induce me to think the same way – thoughts from which I have often enough dissuaded her; for example, only two days before, after returning from a walk, she began, without any external reason at all, to talk about her death and the provisions for dealing with her estate. (She had not, by the way, done anything about this! – an indication that these remarks definitely did not have any intention behind them.) If I may venture on an opinion, I should regard this calamity not as an accident, nor as an effect of a clouding of consciousness, but as an intentional self-destruction performed with an unconscious purpose, and disguised as a chance mishap. This view of mine is confirmed by remarks which Fräulein Z. made to her relatives, both earlier, before she knew me, and also more recently, as well as by remarks to me up to within the last few days; so that I am tempted to regard the whole thing as an effect of the loss of her former fiancé, whom in her eyes nothing could replace.'

1 [This paragraph dates back to 1901.]

was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping ['*hetzen*'] with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. *Almost*, but not quite – or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident – one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which
[189] his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

Stärcke (1916)[1] has given an example of the way in which creative writers do not hesitate to put a bungled action in the place of an intentional action and to make it in this way the source of the gravest consequences:

1 [This final example was added in 1917.]

'In one of Heijermans' (1914) sketches there occurs an example of a bungled action, or, more precisely, of a faulty action which the author uses as a dramatic *motif*.

'The sketch is called "Tom and Teddie". They are a pair of divers who appear in a variety theatre; their act is given in an iron tank with glass walls, in which they stay under water for a considerable time and perform tricks. Recently the wife has started an affair with another man, an animal-trainer. Her diver-husband has caught them together in the dressing-room just before the performance. Dead silence, menacing looks, with the diver saying: "Afterwards!" – The act begins. The diver is about to perform his hardest trick: he will remain "two and a half minutes under water in a hermetically sealed trunk". – This is a trick that they had performed often enough; the trunk was locked and "Teddie used to show the key to the audience, who checked the time by their watches". She also used purposely to drop the key once or twice into the tank and then dive hurriedly after it, so as not to be too late when the time came for the trunk to be opened.

'"This particular evening, January 31st, saw Tom locked up as usual by the neat fingers of his brisk and nimble wife. He smiled behind the peephole – she played with the key and waited for his warning sign. The trainer stood in the wings, in his impeccable evening dress, with his white tie and his horsewhip. Here was the 'other man'. To catch her attention he gave a very short whistle. She looked at him, laughed, and with the clumsy gesture of someone whose attention is distracted she threw the key so wildly in the air that at exactly two minutes and twenty seconds, by an accurate reckoning, it fell by the side of the tank in the middle of the bunting covering the pedestal. No-one had seen it. No-one could see it. Viewed from the house the optical illusion was such that everyone saw the key fall into the water – and none of the stagehands heard it since the [190]
bunting muffled the sound.

'"Laughing, Teddie clambered without delay, over the edge of the tank. Laughing – Tom was holding out well – she came down the ladder. Laughing, she disappeared under the pedestal to look there and, when she did not find the key at once, she bowed in front of the bunting with a priceless gesture, and an expression on her face as if to say 'Gracious me! what a nuisance this is!'

'"Meanwhile Tom was grimacing in his droll way behind the peephole, as if he too was becoming agitated. The audience saw the white of his false teeth, the champing of his lips under the flaxen moustache, the comical bubble-blowing that they had seen earlier, when he was eating

the apple. They saw his pale knuckles as he grappled and clawed, and they laughed as they had laughed so often already that evening.

"'Two minutes and fifty-eight seconds . . .

"'Three minutes and seven seconds . . . twelve seconds . . .

"'Bravo! Bravo! Bravo!

"'Then consternation broke out in the house and there was a shuffling of feet, when the stagehands and the trainer began to search too and the curtain came down before the lid had been raised.

"'Six English dancing-girls came on – then the man with the ponies, dogs and monkeys. And so on.

"'It was not till the next morning that the public knew there had been an accident, that Teddie had been left a widow. . . ."

'It is clear from this quotation what an excellent understanding the author must himself have had of the nature of a symptomatic act, seeing that he demonstrates to us so strikingly the deeper cause of the fatal clumsiness.'

IX
SYMPTOMATIC AND CHANCE ACTIONS[1]

The actions described so far [Chapter VIII], in which we recognized the carrying out of an unconscious intention, made their appearance in the form of disturbances of other intended actions and concealed themselves behind the pretext of clumsiness. The 'chance' actions which are now to be discussed differ from 'bungled' actions merely in the fact that they scorn the support of a conscious intention and are therefore in no need of a pretext. They appear on their own account, and are permitted because they are not suspected of having any aim or intention. We perform them 'without thinking there is anything in them', 'quite accidentally', 'just to have something to do'; and such information, it is expected, will put an end to any enquiry into the significance of the action. In order to be able to enjoy this privileged position, these actions, which no longer put forward the excuse of clumsiness, have to fulfil certain conditions:[2] they must be *unobtrusive* and their effects must be slight. [191]

I have collected a large number of such chance actions from myself and from others, and after closely examining the different examples I have come to the conclusion that the name of *symptomatic acts* is a better one for them. They give expression to something which the agent himself does not suspect in them, and which he does not as a rule intend to impart to other people but to keep to himself. Thus, exactly like all the other phenomena which we have so far considered, they play the part of symptoms.

The richest supply of such chance or symptomatic acts is in fact to be obtained during the psychoanalytic treatment of neurotics. I cannot resist quoting two examples from this source which show how extensively and in what detail these insignificant occurrences are determined by unconscious thoughts. The borderline between symptomatic acts and [192]

1 [The earlier portion of this chapter, up to p. 168, dates back to 1901.]

2 [In 1901 only: 'a certain condition'.]

bungled actions is so ill-defined that I might equally well have included these examples in the last chapter.

(1) During a session a young married woman mentioned by way of association that she had been cutting her nails the day before and 'had cut into the flesh while she was trying to remove the soft cuticle at the bottom of the nail'. This is of so little interest that we ask ourselves in surprise why it was recalled and mentioned at all, and we begin to suspect that what we are dealing with is a symptomatic act. And in fact it turned out that the finger which was the victim of her small act of clumsiness was the ring-finger, the one on which a wedding ring is worn. What is more, it was her wedding anniversary; and in the light of this the injury to the soft cuticle takes on a very definite meaning, which can easily be guessed. At the same time, too, she related a dream which alluded to her husband's clumsiness and her anaesthesia as a wife. But why was it the ring-finger on her *left* hand which she injured, whereas a wedding ring is worn [in her country] on the *right* hand? Her husband is a lawyer, a 'doctor of law' ['*Doktor der Rechte*', literally 'doctor of right(s)'], and as a girl her affections belonged in secret to a physician (jokingly called '*Doktor der Linke*' ['doctor of the left']). A 'left-handed marriage', too, has a definite meaning.

(2) A young unmarried lady said to me: 'Yesterday I quite unintentionally tore a hundred-florin note in two and gave half to a lady who was visiting me. Am I to take this as a symptomatic act as well?' Closer investigation disclosed the following particulars. The hundred-florin note: – She devoted part of her time and means to charitable work. Together with another lady she was providing for the bringing up of an orphan. The hundred florins were the contribution sent to her by the other lady. She had put them in an envelope and placed it on her writing table for the time being.

The visitor was a lady of good standing whom she was assisting in another charitable cause. This lady wished to make a note of the names
[193] of a number of people whose support could be enlisted. There was no paper at hand, so my patient reached for the envelope on her desk, and without thinking of what it contained tore it in two; one piece she kept herself, so as to have a duplicate set of names, and the other she handed to her visitor. It should be observed that her act, though certainly inappropriate, was perfectly harmless. If a hundred-florin note is torn up, it does not, as is well known, lose any of its value so long as it can be put together again completely from the fragments. The importance of the names on the piece of paper was a guarantee that the lady would not

throw it away, and it was equally certain that she would restore the valuable contents as soon as she noticed them.

But what was the unconscious thought to which this chance action, made possible by forgetfulness, was meant to give expression? The visitor stood in a very definite relation to my patient's treatment. It was this lady who had formerly recommended me to her as a doctor, and, if I am not mistaken, my patient felt herself under an obligation to her for this advice. Was the half of the hundred-florin note perhaps meant to represent a fee for her services as an intermediary? That would still be very strange.

Further material was, however, forthcoming. A little time before, a woman who was an intermediary of a very different kind had enquired of a relative of the patient's whether the young lady would perhaps like to make a certain gentleman's acquaintance; and that morning, a few hours before the lady's visit, the suitor's letter of proposal had arrived and had caused much amusement. So when the lady opened the conversation by enquiring after my patient's health, the latter might well have thought: 'You certainly found me the right doctor, but if you could help me to get the right husband' (with the further thought: 'and to get a child') 'I should be *more* grateful.' This thought, which was kept repressed, formed the starting point from which the two intermediaries became fused into one, and she handed her visitor the fee which her phantasy was ready to give the other woman. This solution becomes entirely convincing when I add that I had been telling the patient about such chance or symptomatic acts only the evening before. She thereupon took the first opportunity of producing something analogous.

These extremely frequent chance and symptomatic acts might be [194]
arranged in three groups, according to whether they occur habitually, regularly under certain conditions, or sporadically.[1] Actions of the first group (such as playing with one's watch-chain, fingering one's beard and so on), which can almost be taken as characteristics of the person concerned, trench upon the multifarious movements known as tics and no doubt deserve to be dealt with in connection with them. In the second group I include playing with a stick or scribbling with a pencil that one happens to be holding, jingling coins in one's pocket, kneading bread-crumbs and other plastic materials, fiddling with one's clothing in all kinds of ways and so forth. During psychical treatment idle play of this

1 [The first two of these three groups are dealt with in the present paragraph. The third is not explicitly reached until p. 181 below, most of the intervening material having been added in the later editions of the book – though many of the interpolated examples seem, in fact, to belong already to the third 'sporadic' category.]

sort regularly conceals a sense and meaning which are denied any other form of expression. Generally the person concerned is quite unaware that he is doing anything of the kind or that he has modified his usual play in certain ways; and he fails to see and hear the effects of these actions. He does not, for example, hear the noise made by the jingling of coins, and, if his attention is drawn to it, he behaves as though he were astonished and incredulous. All the things that a person does with his clothing, often without realizing it, are no less important and deserve the doctor's attention. Every change in the clothing usually worn, every small sign of carelessness – such as an unfastened button – every trace of exposure, is intended to express something which the wearer of the clothes does not want to say straight out and which for the most part he is unaware of. The interpretations of these small chance actions, and the evidence for these interpretations, emerge each time with sufficient certainty from the material which accompanies them during the session, from the topic that is under discussion and from the associations that occur when attention is drawn to the apparently chance action. Because of this I shall not proceed to support my assertions with examples accompanied by analyses; but I mention these actions because I believe
[195] that they have the same meaning in the case of normal people as they have in my patients.

I cannot refrain from showing by at least one example[1] how close the connection can be between a symbolic action performed through force of habit and the most intimate and important aspects of a healthy person's life:[2]

'As Professor Freud has taught us, symbolism plays a greater role in the childhood of normal people than earlier psychoanalytical experiences had led one to expect. In this connection the following short analysis may be of some interest, especially in view of its medical subject matter.

'A doctor on rearranging his furniture in a new house came across an old-fashioned, straight wooden stethoscope, and, after pausing to decide where he should put it, was impelled to place it on the side of his writing desk in such a position that it stood exactly between his chair and the one reserved for his patients. The act in itself was somewhat odd, for two reasons. In the first place he does not use a stethoscope at all often (he is, in fact, a neurologist) and if he needs one he uses a binaural one. In the

1 [Added in 1912.]

2 Ernest Jones (1910*d*). [The German text is considerably longer than the published English version, and differs slightly from it. The present version follows the German, though keeping to the English wherever possible.]

second place all his medical apparatus and instruments were kept in drawers, with the sole exception of this one. However, he gave no further thought to the matter until one day a patient, who had never seen a straight stethoscope, asked him what it was. On being told, she asked why he kept it just there; he answered in an offhand way that that place was as good as any other. This started him thinking, however, and he wondered whether there had been any unconscious motive in his action, and being familiar with the psychoanalytical method he decided to investigate the matter.

'The first memory that occurred to him was the fact that when a medical student he had been struck by the habit his hospital interne had of always carrying in his hand a straight stethoscope on his ward visits, although he never used it. He greatly admired this interne, and was much attached to him. Later on, when he himself became an interne, he [196] contracted the same habit, and would feel very uncomfortable if by mistake he left his room without having the instrument to swing in his hand. The aimlessness of the habit was however shown, not only by the fact that the only stethoscope he ever used was a binaural one, which he carried in his pocket, but also in that it was continued when he was a surgical interne and never needed any stethoscope at all. The significance of these observations immediately becomes clear if we refer to the phallic nature of this symbolic action.

'He next recalled the fact that in his early childhood he had been struck by the family doctor's habit of carrying a straight stethoscope inside his hat; he found it interesting that the doctor should always have his chief instrument handy when he went to see patients and only had to take off his hat (i.e. a part of his clothing) and "pull it out". As a small child he had been strongly attached to this doctor; and a brief self-analysis enabled him to discover that at the age of three and a half he had had a double phantasy concerning the birth of a younger sister – namely that she was the child, firstly, of himself and his mother, and secondly, of the doctor and himself. Thus in this phantasy he played both a masculine and feminine part. He further recalled having been examined by the same doctor when he was six, and distinctly recollected the voluptuous sensation of feeling the doctor's head near him pressing the stethoscope into his chest, and the rhythmic to-and-fro respiratory movement. At the age of three he had had a chronic chest affection which necessitated repeated examination, although he could not in fact still remember it.

'At the age of eight he was impressed by being told by an older boy that it was the doctor's custom to get into bed with his women patients. There

certainly was some real basis for this rumour; at all events the women of the neighbourhood, including the subject's own mother, were very attached to the young and handsome doctor. The subject had himself on several occasions experienced sexual temptations in regard to his women patients; he had twice fallen in love with one and finally had married one. It can hardly be doubted that his unconscious identification with the doctor was the chief motive for his adoption of the medical
[197] profession. Other analyses lead us to suppose that this is undoubtedly the commonest motive (though it is hard to determine just how common). In the present case it was doubly determined: firstly by the superiority of the doctor on several occasions over the father, of whom the son was very jealous, and secondly by the doctor's knowledge of forbidden topics and his opportunities for sexual satisfaction.

'Then came a dream which I have already published elsewhere (Jones, 1910*b*); it was plainly of a homosexual-masochistic nature. In this dream a man who was a substitutive figure for the doctor attacked the subject with a "sword". The sword reminded him of a passage in the Völsung Nibelungen Saga, where Sigurd places a naked sword between himself and the sleeping Brünhilde. The same episode occurs in the Arthurian legend which our subject also knows well.

'The meaning of the symptomatic act now becomes clear. Our doctor placed his straight stethoscope between himself and his women patients exactly as Sigurd placed his sword between himself and the woman he was not to touch. The act was a compromise formation: it satisfied two impulses. It served to satisfy in his imagination the suppressed wish to enter into sexual relations with any attractive woman patient, but at the same time it served to remind him that this wish could not become a reality. It was, so to speak, a charm against yielding to temptation.

'I might add that the following lines from Lord Lytton's *Richelieu* made a great impression on the boy:

> Beneath the rule of men entirely great
> The pen is mightier than the sword. . . .[1]

and that he has become a prolific writer and uses an exceptionally large fountain pen. When I asked him why he needed it he gave the characteristic response: "I have so much to express."

1 Compare Oldham's: 'I wear my pen as others do their sword.' [From 'Satire upon a Printer' by John Oldham (1653–83).]

'This analysis again reminds us what profound insight is afforded into mental life by "innocent" and "meaningless" acts, and how early in life the tendency to symbolization develops.'

I can quote a further instance from[1] my psychotherapeutic experience in which eloquent testimony was borne by a hand playing with a lump of breadcrumb. My patient was a boy of not yet thirteen; for almost two years he had been severely hysterical and I finally took him for psychoanalytic treatment after a lengthy stay in a hydropathic institution had brought no success. I was going on the assumption that he must have had sexual experiences and be tormented by sexual questions, which was likely enough at his age; but I refrained from helping him with explanations as I wished to put my hypotheses once again to the test. I was therefore naturally curious as to the way in which he would bring out what I was looking for. One day it struck me that he was rolling something between the fingers of his right hand; he would thrust it in his pocket and continue playing with it there, and then take it out again, and so on. I did not ask what he had in his hand; but he suddenly opened his hand and showed me. It was breadcrumb kneaded into a lump. At the next session he again brought along a similar lump and this time, while we were talking, he modelled figures out of it which excited my interest; he did this with incredible rapidity, with his eyes closed. They were undoubtedly little men, with a head, two arms and two legs, like the crudest prehistoric idols, and with an appendage between the legs which he drew out into a long point. He had hardly completed this when he kneaded the figure together again; later he allowed it to remain, but drew out a similar appendage from the surface of the back and other parts of the body in order to disguise the meaning of the first one. I wanted to show him I had understood him, but at the same time I wanted to prevent him from pretending that he had not thought of anything while he was engaged in making these figures. With this in mind I suddenly asked him if he remembered the story of the Roman king who gave his son's envoy an answer in dumb-show in his garden. The boy failed to recall it, although he must have learnt it so much more recently than I. He asked whether it was the story of the slave and the answer that was written on his shaven head.[2] No, I answered, that is from Greek history, and I told [198]

1 [This example dates back to 1901.]

2 [The story is to be found in Herodotus, Book V, Chapter 35.]

[199] him the story. King Tarquinius Superbus[1] had made his son Sextus find his way secretly into a hostile Latin city. The son, who had meanwhile collected a following in the city, sent a messenger to the king asking what steps he should take next. The king did not answer, but went into his garden, had the question repeated to him there, and then silently struck off the heads of the tallest and finest poppies. All that the messenger could do was to report this to Sextus, who understood his father and arranged for the most distinguished citizens in the city to be removed by assassination.

While I was speaking, the boy stopped kneading and, as I was on the point of describing what the king did in his garden and had reached the words 'silently struck', he made a lightning movement and tore the head off his little man. He had therefore understood me and had seen that he had been understood by me. I could now question him directly, I gave him the information he needed, and in a short time we had brought the neurosis to an end.

The symptomatic acts[2] that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything – and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers – made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by point-
[200] ing to the eggshell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our

1 [In the editions of 1901 and 1904: 'Tarquinius Priscus'. In his interleaved copy of the 1904 edition (cf. Editors' Introduction, p. xvi above), Freud has made an imperfectly legible comment on this slip. The gist of his comment is that in substituting the name of the father for that of the son he was anticipating the remarks which he makes later on in this book (p. 189) on a similar substitution of Zeus for Kronos in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 227, and **5**, 553. The topic of castration provided the link between the two examples.]

2 [This paragraph was added in 1907.]

discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could be reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

Dr J. E. G. van Emden (The Hague) reports another case of 'confession through a parapraxis'.[1] 'In making out my bill, the waiter in a small restaurant in Berlin announced that the price of a particular dish had been increased by ten pfennigs, owing to the war. When I asked why this was not shown on the menu he replied that that must just be an oversight – the price had certainly gone up. He pocketed the money clumsily and dropped a ten-pfennig coin on the table right in front of me.

'"Now I know for certain that you've charged me too much. Would you like me to enquire at the cash desk?"

'"Excuse me . . . one moment, please," and he had gone.

'Needless to say, I allowed him his retreat, and, after he had apologized a couple of minutes later for having for some unknown reason confused my dish with another one, I let him keep the ten pfennigs as a reward for his contribution to the psychopathology of everyday life.'

Anyone[2] who cares to observe his fellow men while they are at table [201]
will be able to observe the neatest and most instructive symptomatic acts.

Thus Dr Hanns Sachs relates: 'I happened to be present when an elderly couple, relatives of mine, took their evening meal. The lady suffered from a gastric complaint and had to observe a very strict diet. A piece of roast meat had just been set before the husband, and he asked his wife, who was not allowed to join in this course, to pass him the mustard. His wife opened the cupboard, reached inside, and put her little bottle of stomach drops on the table in front of her husband. There was of course

1 [Added in 1919.]

2 [This paragraph and the four examples which follow were added in 1912.]

no resemblance between the barrel-shaped mustard pot and the little bottle of drops which might have accounted for her picking up the wrong one; yet the wife did not notice her confusion of the two until her husband laughingly called her attention to it. The meaning of the symptomatic act needs no explanation.'

I owe to Dr B. Dattner, of Vienna, an excellent example of this kind which the observer made very skilful use of:

'I was lunching in a restaurant with my colleague H., a doctor of philosophy. He spoke of the hardships of probationary students, and mentioned incidentally that before he had finished his studies he was given the post of secretary to the ambassador, or, more precisely, the minister plenipotentiary and extraordinary, of Chile. "But then the minister was transferred and I did not present myself to his successor." While he was uttering the last sentence he raised a piece of cake to his mouth, but let it drop from the knife in apparent clumsiness. I immediately grasped the hidden meaning of this symptomatic act, and, as it were casually, interjected to my colleague, who was unfamiliar with psychoanalysis: "You certainly allowed a tasty morsel to slip from you there." He did not, however, notice that my words could apply equally well to his symptomatic act, and repeated my exact words with a peculiarly charming and surprising liveliness just as if my remark had taken the words out of his mouth: "Yes, that was certainly a tasty morsel that I allowed to slip from me", and went on to unburden himself by means of a detailed description of the clumsiness which had lost him this well-paid position.

'The meaning of the symbolic symptomatic act becomes clearer if it is
[202] realized that my colleague had scruples about telling a fairly remote acquaintance like myself of his precarious material situation, and that the obtrusive thought thereupon disguised itself as a symptomatic act which expressed symbolically what was meant to be hidden and in this way afforded the speaker relief which arose from unconscious sources.'

The following examples will show how much meaning may turn out to lie in an apparently unintentional act of carrying something off or taking something away with one.

Dr B. Dattner relates: 'A colleague paid a visit to a friend, a lady he had much admired in the days of his youth; it was the first visit after her marriage. He told me of this visit and expressed his surprise at the fact that he had not succeeded in keeping his resolution to stay only a very short time with her. He then went on to recount a singular parapraxis which had happened to him there. His friend's husband, who had joined

in the conversation, had looked for a box of matches which had quite definitely been on the top of the table when he arrived. My colleague, too, had looked through his pockets to see whether he had not accidentally "snapped it up",[1] but without avail. Some time later he had in fact found "it" in his pocket, and was struck by the fact that there was only a single match in the box. – A dream a few days later which prominently displayed the match-box symbolism and was concerned with this same friend of his youth confirmed my explanation that my colleague's symptomatic act was intended to announce that he had prior rights and to demonstrate his claim to exclusive possession (only one match in the box).'

Dr Hanns Sachs relates: 'Our maid is particularly fond of a certain kind of cake. There is no possible doubt of this, as it is the only thing that she always makes well. One Sunday she brought in this particular cake, put it down on the sideboard, removed the plates and cutlery of the previous course and stacked them on the tray on which she had brought in the cake; she then put the cake back on the top of this pile instead of on the table, and disappeared with it into the kitchen. Our first idea was that she had noticed something that ought to be put right about the cake, but when she failed to appear again my wife rang and asked: "Betty, what [203] has happened to the cake?" "How do you mean?" replied the maid, not understanding. We had first to point out to her that she had taken the cake away with her again. She had put it on the pile of dishes, carried it out and put it away "without noticing". – Next day, as we were about to eat what remained of this cake, my wife noticed that there was just as much as we had left the day before – in other words, that the maid had rejected her own share of her favourite dish. When asked why she had not eaten any of the cake she replied in some embarrassment that she had not wanted any. – The infantile attitude is very clear on both occasions: first, the childish insatiability which did not want to share the object of her wishes with anyone, followed by the equally childish defiant reaction: "If you grudge it me, keep it for yourselves; I don't want anything at all now.'"

Chance actions and symptomatic acts[2] occurring in matrimonial matters often have the most serious significance and might induce people who disregard the psychology of the unconscious to believe in omens. [Cf. p. 221 *n*. below.] It is not a happy beginning when a young bride

1 [In German, the word for 'box' ('*Schachtel*') is feminine; so that this might equally mean 'snapped *her* up'.]

2 [This paragraph was added in 1907.]

loses her wedding ring on the honeymoon; but after all it is usually only mislaid and is soon found again. – I know a lady, now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. – I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I felt a cold chill as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.[1]

[204] The following observation[2] is quoted from one of Alphonse Maeder's valuable studies, published in French (Maeder, 1906). It might equally well have been included among the examples of forgetting:

'Une dame nous racontait récemment qu'elle avait oublié d'essayer sa robe de noce et s'en souvint la veille du mariage à huit heures du soir; la couturière désespérait de voir sa cliente. Ce détail suffit à montrer que la fiancée ne se sentait pas très heureuse de porter une robe d'épouse, elle cherchait à oublier cette représentation pénible. Elle est aujourd'hui . . . divorcée.'[3]

A friend who has learnt to read signs[4] has told me that the great actress Eleonora Duse introduces into one of her parts a symptomatic act which clearly shows the depths from which she draws her artistry. It is a drama of adultery; she has just had an altercation with her husband and now stands apart deep in thought, before the seducer approaches. During the short interval she plays with her wedding ring, takes it off her finger, puts it on again, and then once more takes it off. She is now ready for the other man.

1 [Freud later included the last two examples, and the one that follows, in Lecture III of his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 51.]

2 [Added in 1910.]

3 ['A lady was telling us recently how she had forgotten to try on her wedding dress and remembered it at eight o'clock on the eve of her wedding. The dressmaker had given up hope of seeing her customer. This detail was enough to show that the bride did not feel very happy about wearing a wedding dress; she was trying to forget the painful performance. Today . . . she is divorced.']

4 [This paragraph was added in 1907.]

I add here an account by Theodor Reik (1915*a*)[1] of some other symptomatic acts involving rings.

'We are familiar with the symptomatic acts of married people which consist in their taking off and replacing their wedding rings. My colleague M. produced a series of similar symptomatic acts. He had received a ring as a present from a girl he was in love with, with a note saying that he must not lose it or she would know that he did not love her any more. Subsequently he grew increasingly worried that he might lose the ring. If he had temporarily taken it off (for example, while he was washing) it would regularly be mislaid, so that often it could only be found again after a long search. When he was posting a letter he could not suppress a [205]
slight fear that the ring might be pulled off by the edges of the letterbox. On one occasion he managed things so clumsily that the ring *did* fall into the box. The letter he was sending off on that occasion was a parting note to an earlier lady-love of his, and he felt guilty towards her. Simultaneously he was filled with a longing for this other lady which conflicted with his feelings towards his present love object.'

The theme of the ring[2] leaves one once again with the impression of how hard it is for a psychoanalyst to discover anything new that has not been known before by some creative writer. In Fontane's novel *Vor dem Sturm*, Justizrat Turgany declares during a game of forfeits: 'You may be sure, ladies, that the deepest secrets of nature are revealed in the pledging of forfeits.' Among the examples he uses to support his claim there is one that deserves our special interest: 'I recall a professor's wife – she had reached the age of *embonpoint* – who again and again pulled off her wedding ring to offer it as a forfeit. Do not ask me to describe the happiness of her marriage.' He then went on: 'In the same company there was a gentleman who never tired of depositing his English pocket-knife, with its ten blades, corkscrew and flint and steel, in the ladies' laps, until the bladed monster, after tearing several silk dresses, finally disappeared amid general cries of indignation.'

We shall not be surprised if an object of such rich symbolic meaning as a ring should be made to play a part in some significant parapraxes, even where it does not, in the form of a wedding ring or an engagement ring, mark an erotic tie. The following example of an occurrence of this sort has been put at my disposal by Dr M. Kardos:

'Several years ago a man who is much my junior attached himself to me; he shares my intellectual endeavours and stands to me somewhat in

1 [Added in 1917.]

2 [This paragraph and the next two were added in 1919.]

the relation of a pupil to his teacher. On one particular occasion I presented him with a ring; and this ring has several times given rise to symptomatic acts or parapraxes, whenever anything in our relationship has met with his disapproval. A short time ago he was able to report the following case, which is particularly neat and transparent. We used to
[206] meet once a week, when he regularly came to see me and talk with me; but on one occasion he made an excuse to stay away, as a rendezvous with a young lady seemed more attractive to him. The following morning he noticed – not, however, until long after he had left the house – that the ring was not on his finger. He did not worry any more about it, since he assumed he had left it behind on his bedside table, where he put it every evening, and would find it there when he got home. As soon as he reached home he looked for it, without success, and then began a systematic search of the room, which was equally fruitless. At last it crossed his mind that the ring had been lying on the bedside table – just as had been the case, in fact, for more than a year – beside a small pocket-knife that he normally carried in his waistcoat pocket; the suspicion thus occurred to him that he might have "absent-mindedly" pocketed the ring with the knife. So he felt in his pocket and found that the missing ring was in fact there. "His wedding ring in his waistcoat pocket" is a proverbial way of referring to the place where the ring is kept by a husband who intends to betray the wife who gave it to him. My friend's feeling of guilt had therefore caused him first to punish himself ("you no longer deserve to wear this ring") and secondly to confess his unfaithfulness, though only in the form of an unwitnessed parapraxis. It was only in a roundabout way, while he was describing this parapraxis – an eventuality which could, incidentally, have been foreseen – that he came to confess his little "unfaithfulness".'

I also know of an elderly man[1] who married a very young girl and who decided to spend the wedding night in a hotel in town instead of on the honeymoon journey. Hardly had they reached the hotel when he noticed in alarm that he was without his wallet, which contained all the money for the honeymoon; he had either mislaid it or lost it. He was still able to reach his servant by telephone; the latter found the missing wallet in the discarded wedding suit and brought it to the hotel to the waiting bridegroom who had accordingly entered upon his marriage without means [*ohne Vermögen*]. He was thus able to start his journey with his young bride next morning. In the night, however, he had, as he had apprehensively foreseen, proved 'incapable [*unvermögend*]'.[2]

1 [This paragraph and the following one were added in 1907.]

2 ['*Unvermögend*', 'without means', 'without power', and so 'impotent'.]

It is consoling to reflect that there is an unsuspected extension of the [207]
human habit of 'losing things' – namely, symptomatic acts, and that this habit is consequently welcome, at least to a secret intention of the loser's. It is often only an expression of the low estimation in which the lost object is held, or of a secret antipathy towards it or towards the person that it came from; or else the inclination to lose the object has been transferred to it from other more important objects by a symbolic association of thoughts. Losing objects of value serves to express a variety of impulses; it may either be acting as a symbolic representation of a repressed thought – that is, it may be repeating a warning that one would be glad enough to ignore – or (most commonly of all) it may be offering a sacrifice to the obscure powers of destiny to whom homage is still paid among us today.[1]

Here are a few examples to illustrate these remarks about losing things.[2]

Dr B. Dattner: 'A colleague told me he had unexpectedly lost his "Penkala"[3] pencil which he had had for over two years and which he valued highly because of its superior quality. Analysis revealed the following facts. The day before, my colleague had received a thoroughly disagreeable letter from his brother-in-law, which concluded with the sentence: "I have neither the inclination nor the time at present to encourage you in your frivolity and laziness." The affect connected with this letter was so powerful that next day my colleague promptly sacrificed the pencil, *which was a present from this brother-in-law*, so as not to feel under too great an obligation to him.'[4]

A lady of my acquaintance understandably refrained from visiting the [208]
theatre while in mourning for her old mother. There were only a few days still to elapse before the end of her year of mourning, and she allowed herself to be persuaded by her friends to buy a ticket for a particularly interesting performance. On reaching the theatre she made the discovery that she had lost the ticket. She thought afterwards that she had thrown it away with her tram ticket on leaving the tram. This lady used to pride herself on never losing anything through carelessness.

1 [A footnote inserted in the 1907 edition at this point, and extended in subsequent editions, contained a number of shorter examples of symptomatic acts. These were transferred to the text in the 1924 edition and can be found on pp. 184–6 below.]

2 [This last sentence, the example from Dattner which follows, and the sentence on p. 180 below referring to Rank's article, were added in 1912. The two intervening paragraphs on this page and the next were added in 1917 and 1920.]

3 [The trade name of a special form of pencil.]

4 [Also quoted in Lecture III of the *Introductory Lectures* (1916–17*a*), where the 'Penkala pencil' is merely called a 'pencil'; *RSE*, **15**, 48.]

It is therefore fair to assume that another experience she had of losing something was not without a good reason either. On her arrival at a health resort she decided to pay a visit to a pension where she had stayed on an earlier occasion. She was welcomed there as an old friend and entertained, and when she wanted to pay she was told she was to look on herself as a guest; but this she did not feel was quite proper. It was agreed that she might leave something for the maid who had waited on her, so she opened her purse to put a one-mark note on the table. In the evening the pension's manservant brought her a five-mark note which had been found under the table and which the proprietress thought must belong to the lady. She must therefore have dropped it from her purse in getting out the tip for the maid. She had probably wanted to pay her bill in spite of everything.

An article of some length by Otto Rank (1911*d*, [450]) makes use of dream analysis to expose the sacrificial mood that forms the basis of this act [of losing something], and to reveal its deeper motives.[1] It is of interest when he writes later that often not only losing objects but also *finding* them appears to be [psychologically] determined. In what sense this is to be understood may be gathered from his story, which I include here (Rank, 1915*a*). It is obvious that in cases of losing, the object is already provided; in cases of finding, it has first to be looked for.

'A girl who was materially dependent on her parents wished to buy a piece of cheap jewellery. She enquired in the shop about the price of the
[209] article she fancied, but was disappointed to find that it cost more than the sum she had saved. All the same, it was only a matter of two Kronen that stood between her and this small pleasure. In a depressed mood she began to stroll home through the streets, which were thronged with the evening crowds. Though she describes herself as having been deep in thought, she suddenly noticed lying on the ground, in one of the busiest squares, a small piece of paper which she had just passed by without attending to it. She turned round, picked it up and was astonished to find it was a folded two-Kronen note. She thought: "This has been sent me by fate so that I can buy the jewellery", and started happily back with the idea of taking the hint. But at the same moment she told herself that she ought not to do so, since money that one finds is lucky money and should not be spent.

'The bit of analysis which would make this "chance action" intelligible may probably be inferred from the situation described, even in the

1 [*Footnote added* 1917:] Other articles on the same topic can be found in the *Zentralblatt für Psychoanalyse*, **2** [1912], and in the *Internationale Zeitschrift (ärztl.) für Psychoanalyse*, **1** (1913). – [The rest of the paragraph in the text, and the example which follows, were also added in 1917.]

absence of personal information from the girl herself. Among the reflections that occupied her mind as she was walking home, the thought of her poverty and her restricted material position must no doubt have bulked large; moreover we may guess that that thought took the form of a wishful removal of her straitened circumstances. The idea of how the required sum could most easily be obtained will surely have arisen from her interest in satisfying her modest wish; and it will have suggested the simplest solution – namely, that of finding the money. In this way her unconscious (or preconscious) was predisposed towards "finding", even though – owing to claims on her attention from other quarters ("deep in thought") – the actual thought did not become fully conscious to her. We may go further and, on the strength of similar cases which have been analysed, actually assert that *unconscious* "readiness to look for something" is much more likely to lead to success than consciously directed attention. Otherwise it would be almost impossible to explain how it was that precisely this one person out of the many hundreds of passers-by – and with all the difficulties caused by the poor street lighting and the dense crowds – was able to make the find that came as a surprise to her herself. Some indication of the actual strength of this unconscious or preconscious readiness may be obtained from the remarkable fact that *after* making this find – that is, at a time when the attitude had become superfluous and had certainly been removed from conscious attention – the girl found a handkerchief at a later point on her way home, in a dark and lonely part of a suburban street.' [210]

It must be said[1] that it is precisely such symptomatic acts that often offer the best approach to an understanding of people's intimate mental life.

Turning now to the chance actions that occur sporadically,[2] I will report an example which suggested a comparatively deep interpretation even without analysis. It gives a clear illustration of the conditions under which such symptoms can be produced entirely unobtrusively, and it enables me to subjoin a remark of practical importance. In the course of a summer holiday it happened that I had to wait a few days at a particular place for the arrival of my travelling companion. In the meantime I made the acquaintance of a young man who also seemed to be lonely and was willing enough to join me. As we were staying at the same hotel it was natural for us to take all our meals and walks together. On the afternoon of the third day he suddenly told me that he was expecting his wife to arrive by train that evening. My psychological interest was now

1 [This paragraph was added in 1912.]

2 [See footnote, p. 167 above. – This paragraph and the following one date back to 1901.]

aroused, for I had already been struck that morning by my companion's rejecting my proposal for a longish expedition and objecting during our short walk to taking a certain path which he said was too steep and dangerous. On our afternoon walk he suddenly remarked that I must no doubt be hungry; I must certainly not delay my evening meal on his account – he was going to wait for his wife to arrive and have supper with her. I took the hint and sat down to dinner while he went to the station. Next morning we met in the hall of the hotel. He introduced me to his wife and then said: 'You'll have breakfast with us, won't you?' I had first to go on a small errand in the next street, but promised to be back soon. When I entered the breakfast room, I saw that the couple were both sitting on the same side of a small table by the window. On the opposite side there was only one chair; the husband's big, heavy waterproof cape had
[211] been hung over the back of it, covering the seat. I understood very well the meaning of the coat's being arranged in that way; it had certainly not been done deliberately and was therefore all the more expressive. It meant: 'There's no room for you here, you're superfluous now.' The husband failed to notice that I was standing in front of the table without sitting down; but his wife did, and quickly nudged her husband and whispered: 'Look, you've taken up the gentleman's seat.'

This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of this kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and

doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept *γνῶθι σεαυτόν*[1] runs via the study of one's own apparently accidental actions and omissions.

Of all the writers[2] who have from time to time passed comment on our minor symptomatic acts and parapraxes, or who have made use of them, none has understood their secret nature so clearly or exhibited them in so uncannily life-like a manner as Strindberg – a man whose genius in recognizing such things was, it is true, assisted by grave mental abnormality.[3] Dr Karl Weiss of Vienna (1913) has drawn attention to the following passage in one of his works: [212]

'After a while the Count did in fact come, and he approached Esther quietly, as though he had a rendezvous with her.

"'Have you been waiting long?" he asked in his low voice.

"'Six months, as you know," answered Esther; "but did you see me today?"

"'Yes, just now, in the tram: and I looked into your eyes feeling that I was talking to you."

"'A great deal has 'happened' since the last time."

"'Yes, and I believed it was all over between us."

"'How so?"

"'All the little gifts that I had from you broke in pieces – in an occult way, what is more. But that is something that has been noticed long, long ago."

"'Dear me! Now I remember a whole set of events that I took to be accidents. Once I was given a pair of pince-nez by my grandmother, at a time we were good friends. They were made of polished rock crystal and were excellent for making post mortems[4] – a real miracle of which I took the greatest care. One day I broke with the old lady and she was angry with me. And during the next post mortem the lenses happened to fall out for no reason. I thought they were simply broken and sent them to be repaired. But no, they went on refusing to help me; they were put in a drawer and got lost."

1 ['Know thyself' – the celebrated inscription in the Temple of Apollo at Delphi.]

2 [This paragraph and the passage from Strindberg were added in 1917.]

3 [The facility with which paranoics can correctly interpret symptomatic acts in other people is discussed below, pp. 219–20.]

4 [Esther Borg, in Strindberg's novel, was a doctor.]

"'Dear me! Strange that things that concern the eyes should be the most sensitive. I was once given some opera glasses by a friend; they suited my eyes so well that it was a pleasure to use them. This friend and
[213] I fell out. You know how it happens without visible cause; it seems as though one were not allowed to be in harmony. The next time I wanted to use the opera glasses I could not see clearly. The crosspiece was too short and I saw two images. I don't need to tell you that the crosspiece had not grown shorter and my eyes had not grown further apart! It was a miracle that happens every day – one that bad observers do not notice. How can we explain it? *The psychical power of hatred must be greater than we suppose*. – What is more, the ring that I had from you has lost its stone and will not let itself be repaired; no, it will not. Do you want to part from me, then? . . .'" (*The Gothic Rooms*, German trans., p. 258 f.)

In the field of symptomatic acts, too,[1] psychoanalytic observation must concede priority to imaginative writers. It can only repeat what they have said long ago. Wilhelm Stross has drawn my attention to the following passage in Laurence Sterne's celebrated humorous novel *Tristram Shandy* (Volume VI, Chapter V):

'. . . And I am not at all surprized that *Gregory of Nazianzum*, upon observing the hasty and untoward gestures of *Julian*, should foretel he would one day become an apostate; – or that St *Ambrose* should turn his *Amanuensis* out of doors, because of an indecent motion of his head, which went backwards and forwards like a flail; – or that *Democritus* should conceive *Protagoras* to be a scholar, from seeing him bind up a faggot, and thrusting, as he did it, the small twigs inwards. – There are a thousand unnoticed openings, continued my father, which let a penetrating eye at once into a man's soul; and I maintain it, added he, that a man of sense does not lay down his hat in coming into a room, – or take it up in going out of it, but something escapes, which discovers him.'

I add here a brief and varied collection of symptomatic acts found in healthy and neurotic people:[2]

[214] An elderly colleague who was not a good loser at cards had one evening paid up a largish sum of money that he had lost. He did this without complaining but in a peculiarly restrained mood. After his departure it was discovered that he had left behind at his seat more or less everything he had on him: spectacles, cigar case and handkerchief. This no doubt calls for the translation: 'You robbers! You have well and truly plundered me!'

1 [This paragraph and the quotation from Sterne were added in 1920.]

2 [What follows from this point to the end of the chapter first appeared as a footnote in the 1907 edition (see p. 179 above), and was added to in later editions. It was transferred to the text and to its present position in 1924. – Except where otherwise stated the examples date from 1907.]

A man suffering from occasional sexual impotence, which originated from the intimacy of his relations with his mother in childhood, related that he was in the habit of decorating pamphlets and notes with the letter S, his mother's initial. He cannot bear letters from home coming in contact with other profane correspondence on his desk, and is therefore forced to put the former away separately.

A young lady suddenly flung open the door of the consulting room though the woman who preceded her had not yet left it. In apologizing she blamed her 'thoughtlessness'; it soon turned out that she had been demonstrating the curiosity that in the past had caused her to make her way into her parents' bedroom.

Girls who are proud of having beautiful hair are able to manage their combs and hairpins in such a way that their hair comes down in the middle of a conversation.

Some men scatter small change out of their trouser pockets while they are lying down during treatment and in that way pay whatever fee they think appropriate for the session.

People who forget to take away articles they have brought to the physician's house, such as pince-nez, gloves and purses, are showing by this that they cannot tear themselves away and would like to come back soon. Ernest Jones [1911*b*, 508] says: 'One can almost measure the success with which a physician is practising psychotherapy, for instance, by the size of the collection of umbrellas, handkerchiefs, purses, and so on, that he could make in a month.'[1]

The slightest actions of a habitual nature which are performed with a minimum of attention, such as winding up one's watch before going to sleep, switching off the light before leaving a room, etc., are subject from time to time to disturbances that unmistakably demonstrate the influence of unconscious complexes upon what would seem to be the [215] most fixed habits. Maeder, writing in the periodical *Coenobium* [1909], tells of a house physician who decided to go into town one evening for an important engagement, although he was on duty and was not supposed to leave the hospital. When he returned he was surprised to find the light on in his room. He had forgotten to turn it off when he went out, which was something that he had never failed to do before. But he soon grasped the motive for his forgetfulness. The chief resident medical officer in the hospital would naturally have concluded from the light in the house physician's room that he was at home.

A man overburdened with worries and subject to occasional depressions assured me that he regularly found in the morning that his watch had run down whenever the evening before life had seemed to be

1 [This last sentence was added in 1912, and the following two paragraphs in 1910.]

altogether too harsh and unfriendly. By omitting to wind up his watch he was giving symbolic expression to his indifference about living till the next day.

Another man,[1] whom I do not know personally, writes: 'After fate had dealt me a hard blow, life seemed so harsh and unfriendly that I imagined I had not sufficient strength to live through the next day. I then noticed that almost every day I forgot to wind up my watch. Previously I had never failed to do so; it was something I did regularly before going to bed, as an almost mechanical and unconscious act. But now I only very[2] rarely remembered to do it, and that was when I had something important or specially interesting ahead of me. Should this too be considered a symptomatic act? I could not explain it to myself at all.'

If anyone takes the trouble, as Jung (1907) and Maeder (1909)[3] have done, to note the tunes that he finds himself humming, unintentionally and often without noticing he is doing so, he will pretty regularly be able to discover the connection between the words of the song and a subject that is occupying his mind.

The subtler determinants, too,[4] of the expression of one's thoughts in
[216] speaking or writing deserve careful attention. We believe that in general we are free to choose what words we shall use for clothing our thoughts or what images for disguising them. Closer observation shows that other considerations determine this choice, and that behind the form in which the thought is expressed a glimpse may be had of a deeper meaning – often one that is not intended. The images and turns of phrase to which a person is particularly given are rarely without significance when one is forming a judgement of him; and others often turn out to be allusions to a theme which is being kept in the background at the time, but which has powerfully affected the speaker. In the course of some theoretical discussions I heard someone at a particular time repeatedly using the expression: 'If something suddenly shoots through one's head'.[5] I happened to know that he had recently received news that a Russian bullet had passed right through the cap that his son was wearing on his head.[6]

1 [This paragraph was added in 1912.]

2 [This word appeared in the edition of 1912 only.]

3 [The latter reference was added in 1910.]

4 [This final paragraph was added in 1917.]

5 [I.e. 'if an idea suddenly springs to one's mind'.]

6 [This, as Freud reports in a letter to Lou Andreas-Salomé of July 30, 1915 (Freud, 1966*a*), was what happened to his own eldest son.]

X

ERRORS[1]

Errors of memory are distinguished from forgetting accompanied by paramnesia by the single feature that in the former the error (the paramnesia) is not recognized as such but finds credence. The use of the term 'error', however, seems to depend on yet another condition. We speak of 'being in error' rather than of 'remembering wrongly' where we wish to emphasize the characteristic of objective reality in the psychical material which we are trying to reproduce – that is to say, where what we are trying to remember is something different from a fact of our own psychical life: something, rather, that is open to confirmation or refutation by the memory of other people. The antithesis to an error of memory in this sense is ignorance. [217]

In my *Interpretation of Dreams* (1900*a*) I was responsible for a number of falsifications which I was astonished to discover after the book was published.[2] They concerned historical points and, in general, points of fact. After closer examination I found that they did not owe their origin to my ignorance, but are traceable to errors of memory which analysis is able to explain.

(1) On page 266 (of the first edition) [*RSE*, **5**, 407–8] I refer to the town of *Marburg* [in Hesse] – a name also found in Styria – as Schiller's birthplace. The error occurs in the analysis of a dream which I had during a journey by night and from which I was woken by the guard calling out the name of Marburg station. In the content of the dream someone asked a question about a book by Schiller. In fact, Schiller was not born at the university town of Marburg [in Hesse] but at *Marbach* in Swabia. Moreover, I can assert that I have always known this.

(2) On page 135 [ibid., **4**, 174] Hannibal's father is called *Hasdrubal*. This error annoyed me especially, but it furnished me with the strongest corroboration of my view of such errors. There must be few readers of [218]

1 [The earlier portion of this chapter, up to p. 190, dates back to 1901.]

2 [Freud mentioned the first two of these errors in letters to Fliess immediately after the book was published, on November 5 and 11, 1899 (Freud, 1950*a*, Letters 123 and 124).]

my book who are better acquainted with the history of the house of Barca than its author, who penned this error and who overlooked it in three sets of proofs. The name of Hannibal's *father* was *Hamilcar Barca – Hasdrubal* was the name of Hannibal's *brother*, as well as of his brother-in-law and predecessor in command.

(3) On pages 177 and 370 [*RSE*, **4**, 227, and **5**, 553] I state that Zeus emasculated his father Kronos and dethroned him. I was, however, erroneously carrying this atrocity a generation forward; according to Greek mythology it was Kronos who committed it on his father Uranus.[1]

How is it to be explained that my memory provided me at these points with what was incorrect, while otherwise – as the reader of the book can see for himself – it put at my disposal the most out-of-the-way and unusual material? And how, too, did I pass over these errors while I carefully went through three sets of proofs – as if I had been struck blind?

Goethe said of Lichtenberg:[2] 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it – or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had, in fact, no other choice if I wished to bring forward examples and evidence at all. My awkward position [*Zwangslage*] was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material – in other words, to material that
[219] is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate, and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given:

1 This was not a complete error. The Orphic version of the myth makes Zeus repeat the process of emasculation on his father Kronos. (See Roscher's [1894–7] *Lexicon of Mythology*.) [Cf. footnote 1, p. 172 above.]

2 [In 1901 and 1904 only: 'It was said of Lichtenberg.' – Goethe's remark is also quoted by Freud in his book on *Jokes* (1905*c*), *RSE*, **8**, 82, a work in which many of Lichtenberg's epigrams are discussed, as well as at the end of Lecture II in his *Introductory Lectures* (1916–17*a*), ibid., **15**, 35.]

the errors are derivatives of repressed thoughts connected with my dead father.[1]

(1) Anyone who reads through the dream analysed on p. 266 [*RSE*, **5**, 407 ff.] will in part find undisguisedly, and will in part be able to guess from hints, that I have broken off at thoughts which would have contained an unfriendly criticism of my father. In the continuation of this train of thoughts and memories there in fact lies an annoying story in which books play a part, and a business friend of my father's who bears the name of *Marburg* – the same name that woke me when it was called out at Marburg station on the *Südbahn*. In the analysis I tried to suppress this Herr Marburg from myself and from my readers; he took his revenge by intruding where he did not belong and changing the name of Schiller's birthplace from *Marbach* to *Marburg*.

(2) The error of putting *Hasdrubal* instead of *Hamilcar*, the brother's name instead of the father's, occurred precisely in a context that concerned the Hannibal phantasies of my school years and my dissatisfaction with my father's behaviour towards the 'enemies of our people'.[2] I could have gone on to tell how my relationship with my father was changed by a visit to England, which resulted in my getting to know my half-brother, the child of my father's first marriage, who lived there. My brother's eldest son is the same age as me. Thus the relations between our ages were no hindrance to my phantasies of how different things would have been if I had been born the son not of my father but of my brother. These [220]
suppressed phantasies falsified the text of my book at the place where I broke off the analysis, by forcing me to put the brother's name for the father's.

(3) It is to the influence of the memory of this same brother that I attribute my error in advancing by a generation the mythological atrocities of the Greek pantheon. One of my brother's admonitions lingered long in my memory. 'One thing,' he had said to me, 'that you must not forget is that as far as the conduct of your life is concerned you really belong not to the second but to the third generation in relation to your father.' Our father had married again in later life and was therefore much older than his children by his second marriage. I made the error already described at the exact point in the book at which I was discussing filial piety.

1 [In his Preface to the second edition of *The Interpretation of Dreams*, written in 1908, Freud remarked that after he had completed the book he found that it was 'a portion of my own self-analysis, my reaction to my father's death'. (*RSE*, **4**, xxx.)]

2 [See *The Interpretation of Dreams*, ibid., **4**, 173 ff.]

It has also occasionally happened that friends and patients, whose dreams I have reported, or have alluded to in the course of my dream analyses, have drawn my attention to the fact that the details of the events experienced by us together have been inaccurately related by me. These again could be classified as historical errors. After being put right I have examined the various cases and here too I have convinced myself that my memory of the facts was incorrect only where I had purposely distorted or concealed something in the analysis. Here once again we find *an unobserved error taking the place of an intentional concealment or repression*.[1]

These errors that derive from repression are to be sharply distinguished from others which are based on genuine ignorance. Thus, for example, it was ignorance which made me think during an excursion to the Wachau that I had come to the home of Fischhof, the revolutionary leader. The two places merely have the same name: Fischhof's Emmersdorf is in Carinthia. I, however, knew no better. [Cf. *RSE*, **4**, 187.]

[221] (4)[2] Here is another instructive error that put me to shame, an example of what might be called temporary ignorance. One day a patient reminded me to give him the two books on Venice that I had promised him, as he needed them in preparing for a journey at Easter. 'I have them ready,' I replied, and went to the library to fetch them. The truth, however, was that I had forgotten to look them out, for I did not entirely approve of my patient's journey, which I saw as an unnecessary interruption of the treatment and a material loss to the physician. I therefore took a hasty look round the library for two books I had had my eye on. One was 'Venice, City of Art'; but besides this I thought I must own a historical work in a similar series. Quite right, there it was: 'The Medici'. I took it and brought it to my waiting patient, only ashamedly to acknowledge the error. In reality I of course knew that the Medici have nothing to do with Venice, but for a short time it did not strike me as in any way incorrect. I now had to be fair; as I had so frequently confronted my patient with his own symptomatic acts I could only vindicate my authority in his eyes by being honest and showing him the motives (which I had kept secret) for my disapproval of his journey.

It may, in general, seem astonishing that the urge to tell the truth is so much stronger than is usually supposed. Perhaps, however, my being

1 [Another possible example of this is discussed in Appendix A to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 309–10. An instance of the same mechanism appears in Section IV of 'A Seventeenth-Century Demonological Neurosis' (1923*d*), ibid., **19**, 87 *n*.]

2 [What follows from here to the end of Example 5 was added in 1907.]

scarcely able to tell lies any more is a consequence of my occupation with psychoanalysis. As often as I try to distort something I succumb to an error or some other parapraxis that betrays my insincerity, as can be seen in this last example and in the previous ones.

Of all parapraxes errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on [222]
the resulting mistake in speech or writing. It is the compliance of the linguistic material[1] which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another.

(5) I forbade a patient to telephone the girl he was in love with – but with whom he himself wanted to break off relations – since each conversation served only to renew the struggle about giving her up. He was to write his final decision to her, though there were difficulties about delivering letters to her. He called on me at one o'clock to tell me he had found a way of getting round these difficulties, and among other things asked if he might quote my authority as a physician. At two o'clock he was occupied in composing the letter that was to end the relationship, when he suddenly broke off and said to his mother who was with him: 'Oh! I've forgotten to ask the professor if I may mention his name in the

1 [See also below, p. 235. Freud comments on this characteristic of language in several places. In *The Interpretation of Dreams* (1900*a*), speaking of condensation: 'Words . . . may be regarded as predestined to ambiguity.' (*RSE*, **5**, 304–5.) In the book on *Jokes* (1905*c*), speaking of puns: 'Words are a plastic material with which one can do all kinds of things.' (Ibid., **8**, 30.) In '*Gradiva*' (1907*a*), too, Freud writes of the ambiguity made possible 'by the malleable nature of the material of speech'. (Ibid., **9**, 67.)]

letter.' He rushed to the telephone, put through his call and said into the instrument: 'May I speak to the professor, please, if he's finished dinner?' In answer he got an astonished: 'Adolf, have you gone mad?' It was the same voice which by my orders he should not have heard again. He had simply 'made an error', and instead of the physician's number he had given the girl's.

(6)[1] A young lady was to pay a visit in the *Habsburgergasse* ['Habsburg Street'] to a friend, a lady who had recently been married. She spoke
[223] about it while the family were at table, but said in error that she had to go to the *Babenbergergasse* ['Babenberg Street']. Some of those at the table laughingly drew her attention to her error – or slip of the tongue (according to choice) – which she had not noticed. In fact, two days before this the republic had been proclaimed in Vienna; the black and yellow had vanished and been replaced with the colours of the old Ostmark – red, white and red – and the Habsburgs had been deposed. Our speaker introduced the change of dynasty into her friend's address. In Vienna there is indeed a very well-known Babenberger*strasse*, but no Viennese would speak of it as a '*Gasse*'.[2]

(7)[3] The local schoolteacher at a summer resort, a quite poor but handsome young man, persisted in his courtship of the daughter of the proprietor of a villa, who came from the capital, until the girl fell passionately in love with him and even persuaded her family to give their approval to the marriage in spite of the differences in their social position and race. One day the teacher wrote a letter to his brother in which he said: 'The girl is certainly no beauty; but she is very sweet, and it would be all right as far as that goes. But whether I shall be able to make up my mind to marry a Jewess I cannot yet tell you.' This letter was received by his fiancée and it put an end to the engagement, while at the same time his brother was wondering at the protestations of love addressed to him. My informant assured me that this *was* an error and not a cunning device. I know of another case in which a lady who was dissatisfied with her old doctor but unwilling openly to get rid of him achieved her purpose by mixing up two letters. Here at least I can

1 [Added in 1919.]

2 [In Vienna two terms are used for 'street': '*Strasse*' for the more important streets and '*Gasse*' for the minor ones. – Charlemagne gave the name of '*Ostmark*' (Eastern Province) to the region which ultimately became Austria. It first attained importance under the Babenberg dynasty. This came to an end in the thirteenth century and was succeeded by the Habsburgs who ruled until the end of the First World War. The red, white and red colours adopted by the new republic (in place of the imperial black and yellow) were those of the Babenbergs.]

3 [Added in 1907.]

guarantee that it was error and not conscious cunning that made use of this motif, which is such a familiar one in comedy.

(8)[1] Brill [1912, 191] tells of a lady who asked him for news of a common [224]
acquaintance and in doing so called her in error by her maiden name. When her attention was drawn to the mistake she was forced to admit that she disliked the lady's husband and had been very unhappy about her marriage.

(9)[2] Here is an error which can also be described as a slip of the tongue. A young father presented himself before the registrar of births to give notice of the birth of his second daughter. When asked what the child's name was to be he answered: 'Hanna', and had to be told by the official that he already had a child of that name. We may conclude that the second daughter was not quite so welcome as the first had been.

(10)[3] I will add some other observations of confusion between names; they might of course have been equally well included in other chapters of this book.

A lady is the mother of three daughters two of whom have long been married; the youngest is still awaiting her destiny. At both weddings a lady who is a friend of the family gave the same present, an expensive silver tea-service. Every time the conversation turns to this tea-service the mother makes the error of saying that the third daughter owns it. It is clear that this error expresses the mother's wish to see her last daughter married too – on the assumption that she would be given the same wedding present.

The frequent cases in which a mother confuses the names of her daughters, sons or sons-in-law are just as easy to interpret.

(11) Here is a good example of an obstinate interchange of names; I borrow it from a Herr J. G. who made the observation on himself during a stay in a sanatorium:

'At dinner one day (at the sanatorium) I was having a conversation, which did not interest me much and was entirely conventional in tone, with the lady who was next to me at table, when in the course of it I used a phrase of special affability. The somewhat elderly spinster could not help commenting that it was not usually my habit to behave to her with such affability and gallantry – a rejoinder which contained not only a certain regret but also an obvious dig at a young lady we both knew to [225]

1 [Added in 1912; also reported in Lecture III of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 47.]

2 [Added in 1907.]

3 [Examples 10 and 11 were added in 1920.]

whom I was in the way of being somewhat attentive. Naturally I understood at once. In the course of our further conversation I had to have it repeatedly pointed out to me by my neighbour, to my great embarrassment, that I had addressed her by the name of the young lady whom she regarded with some justice as her more fortunate rival.'

(12)[1] I will also report as an 'error' an incident with a serious background, which was told me by a witness who was closely involved. A lady spent an evening out of doors with her husband and two strangers. One of these two 'strangers' was an intimate friend of hers; but the others knew nothing of this and were meant to know nothing. The friends accompanied the married couple to the door of their house and while they were waiting for the door to be opened they took their leave of one another. The lady bowed to the stranger, gave him her hand and said a few polite words. Then she took the arm of her secret lover, turned to her husband and began to bid him goodbye in the same way. Her husband entered into the situation, raised his hat and said with exaggerated politeness: 'Goodbye, dear lady!' The horrified wife dropped her lover's arm and before the concierge appeared had time to exclaim: 'Goodness! What a stupid thing to happen!' The husband was one of those married men who want to put an act of infidelity on their wife's part beyond the bounds of possibility. He had repeatedly sworn that in such a case more than one life would be in jeopardy. He therefore had inner impediments of the strongest kind to prevent his noticing the challenge contained in this error.

(13)[2] Here is an error of one of my patients: the fact that it was repeated in order to express a contrary meaning makes it particularly instructive. After protracted internal struggles this over-cautious young man brought himself to the point of proposing marriage to the girl who had long been in love with him, as he was with her. He escorted his fiancée home, said goodbye to her, and, in a mood of the greatest happiness, got on to a tram and asked the conductress for *two* tickets. About six months later he had got married but could not yet adjust himself to his conjugal bliss. He wondered whether he had done the right
[226] thing in marrying, missed his former relations with his friends, and had every sort of fault to find with his parents-in-law. One evening he fetched his young wife from her parents' house, got on to a tram with her and contented himself with asking for one ticket only.

1 [Added in 1917.]

2 [Added in 1919.]

(14)[1] How a wish that has been reluctantly suppressed can be satisfied by means of an 'error' is described in a good example of Maeder's (1908*b*). A colleague who had a day free from duties wanted to enjoy it without any interruptions; but he was due to pay a visit in Lucerne to which he did not look forward. After long deliberation he decided to go there all the same. He passed the time on the journey from Zürich to Arth-Goldau in reading the daily papers. At the latter station he changed trains and continued reading. He travelled on till the ticket inspector informed him that he was on the wrong train – the one travelling back from Goldau to Zürich, though he had a ticket for Lucerne.

(15)[2] An analogous, though not entirely successful, attempt to help a suppressed wish to find expression by means of the same mechanism of an error is described by Dr V. Tausk (1917) under the title 'Travelling in the Wrong Direction':

'I had come to Vienna on leave from the front. An old patient had heard I was in town and invited me to visit him as he was ill in bed. I complied with his request and spent two hours with him. When I was leaving, the sick man asked how much he owed me. "I am here on leave and am not practising now," I replied. "Please regard my visit as a friendly turn." The patient hesitated, as he no doubt felt he had no right to claim my professional services in the form of an unremunerated act of friendship. But he finally accepted my answer by expressing the respectful opinion, which was dictated by his pleasure at saving money, that as a psychoanalyst I would no doubt do the right thing. A few moments later I myself had misgivings about the sincerity of my generosity, and with my mind full of doubts – which could hardly be explained in more than one way – I got on a tram of route X. After a short journey I had to change on to route Y. While waiting at the point where I was to change I forgot the business of the fee and was occupied with the symptoms of my patient's illness. Meanwhile the tram I was waiting for came and I got on it. But at the next stop I had to get off again. I had in [227]
fact inadvertently and without noticing got on to an X tram instead of a Y tram, and had travelled back again in the direction I had just come from – in the direction of my patient from whom I did not wish to accept any fee. *But my unconscious wanted to collect it*.'

1 [Added in 1910.]

2 [Added in 1919.]

(16)[1] A trick very similar to the one in Example 14 was once[2] brought off by me myself. I had promised my strict eldest brother that that summer I would make my long-due visit to him at an English seaside resort, and had undertaken, as time was limited, to travel by the shortest route, without breaking my journey anywhere. I asked if I might stop for a day in Holland, but he thought I might postpone that till my journey back. So I travelled from Munich via Cologne to Rotterdam and the Hook of Holland from where the boat starts at midnight for Harwich. I had to change at Cologne; I left my train to change into the Rotterdam express, but it was nowhere to be found. I asked various railway officials, was sent from one platform to another, fell into a mood of exaggerated despair and soon realized that during this fruitless search I must have missed my connection. After this was confirmed I considered whether I should spend the night in Cologne. Among other considerations in favour of that plan was one of filial piety, since according to an old family tradition my ancestors had once fled from that city during a persecution of the Jews.[3] However, I decided against it, travelled by a later train to Rotterdam, which I reached late in the night, and was then obliged to spend a day in Holland. That day brought me the fulfilment of a long-cherished wish; I was able to see Rembrandt's magnificent paintings at the Hague and in the Rijksmuseum at Amsterdam. It was only the next morning, when I was travelling on the train across England and could collect my impressions, that a clear memory emerged of my having seen a large notice in the station at Cologne – a few steps from the place where I had got off the train and on the same platform – which read 'Rotterdam – Hook of Holland'. There, waiting for me, had been the train on which I ought to have continued my journey. My action in hurrying away in spite
[228] of this clear direction, and my search for the train in another place, would have to be described as an incomprehensible 'blindness' unless one is prepared to assume that – contrary to my brother's instructions – I had really resolved to admire the Rembrandts on the journey out. Everything else – my well-acted perplexity, the emergence of the 'pious' intention to spend the night in Cologne – was merely a contrivance to keep my resolution hidden from myself till it had been completely carried out.

1 [Added in 1910.]

2 [In 1910: 'only recently'.]

3 [Cf. *An Autobiographical Study* (1925*d*), *RSE*, **20**, 6. A full account of Freud's journey can be found in Jones (1955, 57–8).]

(17)[1] From his own personal experience J. Stärcke (1916) tells of a similar device produced by 'forgetfulness' for the purpose of fulfilling an ostensibly renounced wish.

'I once had to give a lecture with lantern slides at a village; but the lecture was postponed for a week. I had answered the letter about the postponement and had entered the new date in my notebook. I should have been glad to go to this village in the afternoon, for then I should have had time to pay a visit to a writer I knew who lived there. To my regret, however, I had at the time no afternoon that I could keep free. Somewhat reluctantly, I gave up the idea of the visit.

'When the evening of the lecture arrived I set out for the station in the greatest hurry with a case of lantern slides. I had to take a taxi to catch the train. (It happens frequently with me that I put things off so long that I have to take a taxi if I am to catch my train.) When I reached my destination I was a little surprised that there was no-one at the station to meet me (as is the usual practice with lectures in smallish places). It suddenly occurred to me that the lecture had been postponed for a week and that I had made a fruitless journey on the date that had been originally fixed. After I had roundly cursed my forgetfulness, I debated whether I should return home by the next train. However, upon closer consideration I reflected that I now had a fine opportunity of paying the visit I had wanted to, and I thereupon did so. It was only when I was on my way that it struck me that my unfulfilled wish to have sufficient time for this visit had neatly hatched the plot. Being weighed down by the heavy case of lantern slides and hurrying to catch the train could serve excellently to hide the unconscious intention all the more effectively.'

It may perhaps be thought[2] that the class of errors whose explanation I have given here is not very numerous or particularly significant. But I leave it open for question whether there is not some ground for extending the same line of approach to our assessment of the far more important *errors of judgement* made by human beings in their lives and in scientific work. Only for the rarest and best-adjusted mind does it seem possible to preserve the picture of external reality, as it is perceived, against the distortion to which it is normally subjected in its passage through the psychical individuality of the percipient. [229]

1 [Added in 1917.]

2 [This paragraph dates back to 1901.]

XI

COMBINED PARAPRAXES[1]

[230] Two of the last-mentioned examples – my own error which transferred the Medici to Venice [p. 190 above], and that of the young man who succeeded in getting a conversation with his fiancée on the telephone in defiance of my prohibition [pp. 191–2] – have not, in fact, been described entirely accurately. Careful consideration reveals that they are a combination of an act of forgetting and an error. I can illustrate this combination still more clearly from some other examples.[2]

(1) A friend tells me of the following experience. 'Some years ago I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings, which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly *forgotten* the meetings of the society. When I read your book on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'

(2) The next example combines a symptomatic act with a case of mislaying. It reached me in a somewhat roundabout way, but comes from a reliable source.

[231] A lady travelled to Rome with her brother-in-law, who is a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique

1 [This chapter was first included in the 1907 edition. It then consisted of the first four and the last paragraphs only. Further examples were added in the later editions of the book.]

2 [The first three of the following examples were repeated in Lecture III of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 50–1. The second example is there attributed to R. Reitler.]

gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her – how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent off; and it was at this point that the meaning of her 'absent-mindedness' dawned on the lady: she wanted to keep the object for herself.

(3)[1] There are some cases in which the parapraxis obstinately repeats itself, at the same time changing the method that it employs:

For reasons unknown to him, Ernest Jones (1911*b*, 483) once left a letter lying on his desk for several days without posting it. At last he decided to send it off, but he had it returned to him from the 'Dead Letter Office'[2] since he had forgotten to address it. After he had addressed it he again took it to the post, but this time it had no stamp. He was then no longer able to overlook his reluctance to sending the letter off at all.

(4) The vain attempts to carry out an action in opposition to an internal resistance are most impressively depicted in a short communication by Dr Karl Weiss (1912) of Vienna:

'The following episode will show how persistently the unconscious can make itself felt if it has a motive for preventing an intention from being carried out, and how hard it is to guard against that persistence. An acquaintance asked me to lend him a book and to bring it to him the next day. I immediately promised I would, but was aware of a lively feeling of unpleasure which I could not at first explain. Later on it became clear to me: the person in question had for years owed me a sum of money which he apparently had no idea of repaying. I thought no more of the matter, but I remembered it the next morning with the same feeling of unpleasure and at once said to myself: "Your unconscious will arrange for you to forget the book; but you don't want to be disobliging, so you will take all possible steps not to forget it." I came home, wrapped up the book and put it beside me on the desk where I write my letters. After some time I went out; I took a few steps and remembered I had left the letters I wanted to post on my desk. (One of them, by the way, was a letter in which I was obliged to write something disagreeable to someone from whom I was hoping to get support over a certain matter.) I turned back, [232]

1 [Examples 3–5 were added in 1912.]

2 [In English in the original.]

took the letters and again set off. In the tram it occurred to me that I had promised my wife to buy something for her, and I was very pleased with the thought that it would only make a small parcel. At that point the association "parcel" – "book" suddenly occurred to me, and I now noticed that I was not carrying the book. So I had not only forgotten it the first time I went out, but had also persisted in overlooking it when I took the letters that it lay beside.'

(5) The same situation is found in an instance which Otto Rank (1912*e*) analysed exhaustively:

'A scrupulously orderly and pedantically precise man reported the following experience, which was quite unusual for him. One afternoon he was in the street and wanted to know the time; and he found he had left his watch at home – a thing he did not remember ever having done before. As he had an evening engagement for which he had to be punctual, and as he had not enough time to fetch his own watch before it, he took advantage of a visit to a lady, a friend of his, to borrow her watch for the evening. This was all the more feasible since he already had an engagement to visit the lady next morning, and he promised to return the watch on that occasion. Next day, however, when he wanted to hand over the watch he had borrowed to its owner, he found to his astonishment that now he had left *it* at home. This time he had his own watch on him. He then firmly resolved to return the lady's watch the same afternoon and actually carried out his resolution. But when he wanted to see the time upon leaving her, he found to his immense annoyance and astonishment that he had again forgotten his own watch.

[233] 'The repetition of this parapraxis seemed so pathological to a man with his love of orderliness that he would have been glad to learn of its psychological motivation; and this was promptly revealed by the psychoanalytic enquiry as to whether anything disagreeable had happened to him on the crucial day when he was forgetful for the first time, and in what connection it had occurred. He immediately related how after lunch – shortly before he went out forgetting his watch – he had had a conversation with his mother, who told him that an irresponsible relative, who had already caused him much worry and expense, had pawned his [the relative's] watch, but, as it was needed in the house, was asking him [the narrator] to provide the money to redeem it. He was very much upset by what was a more or less forced loan, and it recalled to his mind all the annoyances that the relative had caused him over many years. His symptomatic act therefore proves to have had more than one determinant. In the first place it gave expression to a train of thought that ran

somewhat as follows: "I won't allow money to be extorted from me in this way, and if a watch is needed I shall leave my own at home." But since he needed it in the evening for keeping an appointment, this intention could only come into effect by an unconscious path, in the form of a symptomatic act. In the second place, what the act of forgetting signified came to this: "The perpetual sacrifice of money on this good-for-nothing will be the utter ruin of me, so that I shall have to give up everything." Although, according to him, his indignation at this piece of news was only momentary, the repetition of the same symptomatic act nevertheless shows that it continued to operate intensively in the unconscious, somewhat as though his consciousness were saying: "I can't get this story out of my head."[1] In view of this attitude of the unconscious, it will come as no surprise to us that the same thing should have happened to the borrowed lady's watch. But perhaps there were also special motives that favoured this transference on to the "innocent" lady's watch. Probably the most obvious motive is that he would no doubt have liked to keep it to take the place of the watch of his own which he had sacrificed, and that he therefore forgot to return it the next day. He would also perhaps have been glad to have the watch as a souvenir of the [234]
lady. Furthermore, forgetting the lady's watch gave him the opportunity of paying the lady he admired a second visit. He was in any case obliged to call on her in the morning in connection with another matter, and by forgetting the watch he seems, as it were, to indicate that it was a shame to use this visit, which had been arranged some time before, for the incidental purpose of returning the watch. Moreover, having twice forgotten his own watch, and in that way being able to return the other watch, goes to show that unconsciously he was trying to avoid carrying both watches at once. He was obviously seeking to avoid giving this appearance of superfluity, which would have been in striking contrast to his relative's want. But on the other hand he contrived by these means to counter his apparent intentions of marrying the lady, by warning himself that he had indissoluble obligations to his family (his mother). Finally, another reason for forgetting a lady's watch may be sought in the fact that the evening before he had, as a bachelor, felt embarrassment in front of his friends about looking at the lady's watch, and only did so surreptitiously; and to avoid a repetition of this awkward situation he did not like to carry it any longer. But as he had on the other hand to

1 'The continued operation of an idea in the unconscious manifests itself sometimes in the form of a dream following the parapraxis, and sometimes in a repetition of the parapraxis or in a failure to correct it.'

return it, the result here too was an unconsciously performed symptomatic act, which proved to be a compromise formation between conflicting emotional impulses, and a dearly bought victory by the unconscious agency.'

Here are three cases observed by J. Stärcke (1916, 108–9):[1]

(6) *Mislaying, breaking and forgetting* [*Verlegen – Zerbrechen – Vergessen*] *as an expression of a counterwill that has been pushed back*. 'I had got together a number of illustrations for a scientific work, when one day my brother asked me to lend him some which he wanted to use as lantern slides in a lecture. Though I was momentarily aware of thinking I would prefer it if the reproductions I had collected at much pains were not exhibited or published in any way before I could do so myself, I promised him I would look out the negatives of the pictures he wanted and make lantern slides from them. These negatives, however, I was unable to find. I looked through the whole pile of boxes full of the relevant negatives, and a good two hundred negatives passed through my
[235] hands, one after the other; but the negatives I was looking for were not there. I had a suspicion that in fact I seemed not to want my brother to have the pictures. After I had made this unfriendly thought conscious and had combated it, I noticed I had put the top box of the pile on one side, and had not looked through it; and this box contained the negatives I was looking for. On the lid of this box there was a brief note of the contents, and it is likely that I had given it a hasty glance before I put the box aside. The unfriendly thought, however, seemed not yet to have been totally subdued, for there were a variety of further happenings before the slides were dispatched. I pressed too hard on one of the slides and broke it, while I was holding it in my hand and was wiping the glass clean. (In the ordinary way I never break a lantern slide like that.) When I had made a new copy of this slide it fell from my hand, and was only saved from being smashed by my stretching out my foot and breaking its fall. When I mounted the lantern slides the whole pile fell to the ground once more, fortunately without any being broken. And finally, several days passed before I actually packed them and sent them off; for though I intended to do so afresh every day, each time I forgot my intention once again.'

(7) *Repeated forgetfulness* [*Vergessen*] *– eventual performance bungled* [*Vergreifen*]. 'One day I had to send a postcard to an acquaintance; but I kept on postponing doing so for several days. I strongly suspected that this was due to the following causes: he had informed me by letter that a

1 [Examples 6–8 were added in 1917.]

certain person would come to see me in the course of the week from whom I was not particularly anxious to have a visit. When the week had passed and the prospect of the unwanted visit had become very slender I finally wrote the postcard, in which I informed him when I should be free. When writing the postcard I thought at first of adding that I had been prevented from writing earlier by *druk werk* ([Dutch for] "laborious, exacting or burdensome work"); but in the end I did not do so as no reasonable human being believes this stock excuse any longer. Whether this little untruth was nevertheless bound to make its appearance I do not know; but when I pushed the postcard into the letterbox I accidentally put it into the lower opening: *Drukwerk* ([Dutch for] "printed matter")."

(8) *Forgetting and error*. 'One morning, in very fine weather, a girl [236] went to the Rijksmuseum to draw some plaster-casts there. Though she would have preferred to go for a walk, as the weather was so fine, she nevertheless made up her mind to be industrious for once and to do some drawing. First she had to buy some drawing paper. She went to the shop (about ten minutes' walk from the museum), and bought some pencils and other materials for sketching, but quite forgot to buy the drawing paper. Then she went to the museum, and as she was sitting on her stool ready to begin, she found she had no paper and had to go back to the shop. After fetching some paper she began to draw in earnest, made good progress and, after some time, heard the clock in the museum tower strike a large number of times. "That will be twelve o'clock", she thought, and continued working until the clock in the tower struck the quarter ("that", she thought, "will be a quarter-past twelve"), packed up her drawing materials and decided to walk through the Vondelpark[1] to her sister's house and have coffee there (which, in Holland, is equivalent to luncheon). At the Suasso Museum she saw to her astonishment that it was only twelve o'clock, not half past! The temptingly fine weather had got the better of her industriousness, and in consequence she had not recalled, when the clock struck twelve times at half-past eleven, that belfry clocks strike the hour at the half-hour as well.'

(9)[2] As some of the above instances have already shown, the unconsciously disturbing purpose can also achieve its aim by obstinately repeating the same kind of parapraxis. I borrow an amusing example of this from a small volume, *Frank Wedekind und das Theater*, which has

1 [The 'Bois de Boulogne' of Amsterdam. The Suasso Museum is a portion of the Municipal Museum.]

2 [Added in 1919.]

been published in Munich by the Drei Masken Verlag; but I must leave the responsibility for the anecdote, which is told in Mark Twain's manner, to the author of the book.

'In Wedekind's one-act play *Die Zensur* [The Censorship] there occurs at its most solemn moment the pronouncement: "The fear of death is an intellectual error [*Denkfehler*]." The author, who set much store by the passage, asked the performer at rehearsal to make a slight pause
[237] before the word "*Denkfehler*". On the night, the actor entered wholeheartedly into his part, and was careful to observe the pause; but he involuntarily said in the most solemn tones: "The fear of death is a *Druckfehler* [a misprint]." In reply to the actor's enquiries at the end of the performance, the author assured him that he had not the smallest criticism to make; only the passage in question did not say that the fear of death is a misprint but that it is an intellectual error. – When *Die Zensur* was repeated on the following night, the actor, on reaching the same passage, declared, and once again in the most solemn tones: "The fear of death is a *Denkzettel* [a memorandum]." Wedekind once more showered unstinted praise on the actor, only remarking incidentally that what the text said was not that the fear of death was a memorandum but that it was an intellectual error. – Next night *Die Zensur* was given again, and the actor, with whom the author had meanwhile struck up a friendship and had exchanged views on artistic questions, declared when he came to the passage, with the most solemn face in the world: "The fear of death is a *Druckzettel* [a printed label]." The actor received the author's unqualified appreciation, and the play was given many more performances; but the author had made up his mind that the notion of an "intellectual error" was a lost cause for good and all.'

Rank (1912*e* and 1915*b*[1]) has also given attention to the very interesting relations between 'Parapraxes and Dreams', but they cannot be followed without a thorough analysis of the dream which is linked to the parapraxis. I once dreamt, as part of a longish dream, that I had lost my purse. In the morning while I was dressing I found that it was really missing. While undressing the night before I had the dream, I had forgotten to take it out of my trouser pocket and put it in its usual place. I was therefore not ignorant of my forgetfulness and it was probably meant to give expression to an unconscious thought which was prepared for making its appearance in the content of the dream.[2]

1 [This paragraph was added in 1912; the reference to Rank's second paper was inserted in 1917.]

2 [*Footnote added* 1924:] It is not so rare an event for a parapraxis like losing or mislaying something to be undone by means of a dream – by one's learning in the dream where the missing object is to be found; but this has nothing about it in the nature of the occult, so long as dreamer

I do not mean to assert that cases of combined parapraxes like these [238]
can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.

and loser are the same person. [Cf. below, p. 225.] A young lady writes: 'About four months ago at the bank I [noticed that I had] lost a very beautiful ring. I hunted in every nook and cranny of my room without finding it. A week ago I dreamt it was lying beside the cupboard by the radiator. Naturally the dream gave me no rest, and next morning I did in fact really find it in that very spot.' She is surprised at this incident, and maintains that it often happens that her thoughts and wishes are fulfilled in this way, but omits to ask herself what change had occurred in her life between the loss and the recovery of the ring.

XII
DETERMINISM, BELIEF IN CHANCE AND SUPERSTITION – SOME POINTS OF VIEW[1]

[239] The general conclusion that emerges from the previous individual discussions may be stated in the following terms. *Certain shortcomings in our psychical functioning* – whose common characteristics will in a moment be defined more closely – *and certain seemingly unintentional performances prove, if psychoanalytic methods of investigation are applied to them, to have valid motives and to be determined by motives unknown to consciousness.*

In order to be included in the class of phenomena explicable in this way, a psychical parapraxis must fulfil the following conditions:

(*a*) It must not exceed certain dimensions fixed by our judgement, which we characterize by the expression 'within the limits of the normal'.

(*b*) It must be in the nature of a momentary and temporary disturbance. The same function must have been performed by us more correctly before, or we must at all times believe ourselves capable of carrying it out more correctly. If we are corrected by someone else, we must at once recognize the rightness of the correction and the wrongness of our own psychical process.

(*c*) If we perceive the parapraxis at all, we must not be aware in ourselves of any motive for it. We must rather be tempted to explain it by 'inattentiveness', or to put it down to 'chance'.

There thus remain in this group the cases of forgetting [*Vergessen*], the errors in spite of better knowledge, the slips of the tongue [*Versprechen*], misreadings [*Verlesen*], slips of the pen [*Verschreiben*], bungled actions [*Vergreifen*] and the so-called 'chance actions'.
[240] Language points to the internal similarity between most of these phenomena: they are compounded alike [in German] with the prefix '*ver*-'.[2]

1 [Except where otherwise indicated, the early part of this chapter (up to p. 209) dates back to 1901.]

2 [The prefix '*ver*-' in German corresponds closely to the English prefix '*mis*-' in such words as 'mishear', 'mislay' and 'misread'.]

The explanation of the psychical processes which are defined in this way leads on to a series of observations which should in part excite a wider interest.

(A) If we give way to the view that a part of our psychical functioning cannot be explained by purposive ideas [*Zielvorstellungen*], we are failing to appreciate the extent of determination[1] in mental life. Both here and in other spheres this is more far-reaching than we suspect. In an article in [the Vienna daily paper] *Die Zeit* by R. M. Meyer, the literary historian, which I came across in 1900, the view was put forward and illustrated by examples that it is impossible intentionally and arbitrarily to make up a piece of nonsense. I have known for some time that one cannot make a number occur to one at one's own free choice any more than a name. Investigation of a number made up in an apparently arbitrary manner – one, let us say, of several digits uttered by someone as a joke or in a moment of high spirits – reveals that it is strictly determined in a way that would really never have been thought possible. I will begin by briefly discussing an instance of an arbitrarily chosen first name, and then analyse in some detail an analogous example of a number 'thrown out without thinking'.

(1) With a view to preparing the case history[2] of one of my women patients for publication I considered what first name I should give her in my account. There appeared to be a very wide choice; some names, it is true, were ruled out from the start – the real name in the first place, then the names of members of my own family, to which I should object, and perhaps some other women's names with an especially peculiar sound. But otherwise there was no need for me to be at a loss for a name. It might have been expected – and I myself expected – that a whole host of [241] women's names would be at my disposal. Instead, one name and only one occurred to me – the name 'Dora'.

I asked myself how it was determined. Who else was there called Dora? I should have liked to dismiss with incredulity the next thought to occur to me – that it was the name of my sister's nursemaid; but I have so much self-discipline or so much practice in analysing that I held firmly to the idea and let my thoughts run on from it. At once there came to my mind a trivial incident from the previous evening which provided the determinant I was looking for. I had seen a letter on my sister's dining-room table addressed to 'Fräulein Rosa W.'. I asked in surprise who

1 [I.e. the degree to which the principle of determinism operates.]

2 [This was the 'Fragment of an Analysis of a Case of Hysteria' (1905*e*). Though the greater part of this was written in January, 1901 (that is to say, before the present work appeared), Freud did not publish it till the autumn of 1905. See the Editors' Note, *RSE*, 7, 3 ff.]

there was of that name, and was told that the girl I knew as Dora was really called Rosa, but had had to give up her real name when she took up employment in the house, since my sister could take the name 'Rosa' as applying to herself as well. 'Poor people,' I remarked in pity, 'they cannot even keep their own names!' After that, I now recall, I fell silent for a moment and began to think of a variety of serious matters which drifted into obscurity, but which I was now easily able to make conscious. When next day I was looking for a name for someone *who could not keep her own*, 'Dora' was the only one to occur to me. The complete absence of alternatives was here based on a solid association connected with the subject matter that I was dealing with: for it was a person employed in someone else's house, a governess, who exercised a decisive influence on my patient's story, and on the course of the treatment as well.

Years later[1] this little incident had an unexpected sequel. Once, when I was discussing in a lecture the long since published case history of the girl now called Dora, it occurred to me that one of the two ladies in my audience had the same name Dora that I should have to utter so often in a whole variety of connections. I turned to my young colleague, whom I also knew personally, with the excuse that I had not in fact remembered that that was her name too, and added that I was very willing to replace it in my lecture with another name. I was now faced with the task of rapidly choosing another one, and I reflected that I must at all costs avoid
[242] selecting the first name of the other lady in the audience and so setting a bad example to my other colleagues, who were already well grounded in psychoanalysis. I was therefore very much pleased when the name 'Erna' occurred to me as a substitute for Dora, and I used it in the lecture. After the lecture I asked myself where the name Erna could possibly have come from, and I could not help laughing when I noticed that the possibility I had been afraid of when I was choosing the substitute name had nevertheless come about, at least to some extent. The other lady's family name was Lucerna, of which Erna is a part.

(2) In a letter to a friend I informed him I had just then finished correcting the proofs of *The Interpretation of Dreams* and did not intend to make any more changes in the work, 'even if it contains 2467 mistakes'.[2] I at once tried to explain this number to myself and added the little analysis as a postscript to my letter. The best plan will be to quote it as I wrote it down at the time, just after I had caught myself in the act:

1 [This paragraph was added in 1907.]

2 [The friend was Wilhelm Fliess of Berlin, to whom Freud sent this analysis in a postscript to his letter of August 27, 1899 (Freud, 1950*a*, Letter 116).]

'Let me hastily add a contribution to the psychopathology of everyday life. You will find that in the letter I put down the number 2467 as a bold arbitrary estimate of the number of mistakes which will be found in the dream book. What I meant was some very big number; but that particular one emerged. However, nothing in the mind is arbitrary or undetermined. You will therefore rightly expect that the unconscious had hastened to determine the number which was left open by consciousness.[1] Now, immediately before, I had read in the newspaper that a General E. M. had retired from the post of Master of Ordnance. I should explain that I am interested in this man. While I was serving as a medical officer cadet he came to the sick quarters one day (he was then a colonel) and said to the medical officer: "You must make me well in a week, because I have some work to do for which the Emperor is waiting." After that episode I decided to follow his career, and lo and behold! now he has reached the end of it, having become Master of Ordnance, and is already (1899) on the retired list. I wanted to work out [243] how long he had taken over this. Assuming that it was in 1882 that I saw him in hospital, it must have been seventeen years. I told my wife this and she remarked: "Oughtn't you to be on the retired list too, then?" "Heaven forbid!" I exclaimed. After this conversation I sat down to write to you. But the earlier train of thought went on in my mind, and with good reason. I had miscalculated; I have a fixed point in my memory to prove it. I celebrated my majority, i.e. my twenty-fourth birthday, under military arrest (having been absent without leave). So that was in 1880, or nineteen years ago. That gives you the "24" in 2467. Now take my present age – 43 – add 24, and you have 67. In other words, in answer to the question whether *I* meant to retire too, my wish gave me another twenty-four years' work. I was obviously annoyed at having failed to get very far myself during the period in which I have followed Colonel M.'s career; and yet I was celebrating a kind of triumph over his career being at an end, while I still have everything in front of me. So one can say with justice that not even the number 2467 which I threw out unthinkingly was without its determinants from the unconscious.'

(3)[2] Since this first example in which an apparently arbitrarily chosen number was explained I have often repeated the same experiment, and with the same result; but the content of the majority of cases is so intimate that they cannot be reported.

1 [There is a brief allusion by Freud to this view of the determination of numbers in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 460.]

2 [Example 3, apart from this first sentence which dates back to 1901, was added in 1907.]

For that very reason, however, I will take the opportunity of adding here a very interesting analysis of a 'numerical association', which Dr Adler (1905) of Vienna obtained from a 'perfectly healthy' informant. 'Yesterday evening', this informant reports, 'I got down to *The Psychopathology of Everyday Life*, and would have read the whole of the book straight away if I had not been prevented by a remarkable incident. For what happened was that, when I read that every number which we summon seemingly arbitrarily into consciousness has a definite meaning, I decided to make an experiment. There came to my mind the number 1734. The following ideas then rapidly occurred to me: 1734 ÷ 17 = 102; 102 ÷ 17 = 6. I then divided the number into 17 and 34. I am 34 years old.
[244] I believe, as I think I once told you, that 34 is the last year of youth, and for that reason I felt very miserable on my last birthday. The end of my 17th year saw the beginning of a very pleasant and interesting period in my development. I divide my life into portions of 17 years. What do the divisions mean? In thinking of the number 102 it occurred to me that No. 102 in the Reclam Universal Library is Kotzebue's play *Menschenhass und Reue* [*Misanthropy and Remorse*].[1]

'My present psychical state is one of misanthropy and remorse. No. 6 in the U.L. (I know a whole quantity of its numbers by heart) is Müllner's *Die Schuld* [*Guilt*].[2] The thought plagues me constantly that the guilt is mine for my failure to become what I could have been with my abilities. It further occurred to me that No. 34 in the U.L. contains a tale by the same Müllner entitled *Der Kaliber* [*The Calibre*]. I divided the word into "Ka" and "Liber"; it further occurred to me that it contains the words "Ali" and "Kali" ["potassium"]. This reminded me of my once making up rhymes with my (six-year-old) son Ali. I asked him to find a rhyme to Ali. He could not think of any, and as he wanted me to give him one I said: "*Ali reinigt den Mund mit hypermangansaurem Kali*." ["Ali cleans his mouth with potassium permanganate."] We laughed a lot and Ali was very *lieb* [sweet]. During the last few days I have been obliged to notice with regret that he is "*ka* (*kein*) *lieber Ali*" ["not the sweet Ali" ("*ka lieber*" pronounced as "*Kaliber*")].

'I then asked myself: what is No. 17 in the U.L.? but I could not bring it to mind. But I quite certainly knew it earlier, so I assumed I wanted to forget that number. All reflection was in vain. I wanted to go on reading, but I only read mechanically, without understanding a word, as the 17

1 [The Reclam Universal Library was an old-established and very comprehensive series of paperbound reprints. Kotzebue (1761–1819) was perhaps better known in England for another of his plays, *Lovers' Vows*, which was *not* performed at *Mansfield Park*.]

2 [Adolf Müllner (1774–1829).]

was tormenting me. I put out the light and continued my search. Finally, I came to the conclusion that No. 17 must be a play of Shakespeare's. But which one? I thought of *Hero and Leander* – clearly a stupid attempt on the part of my will to lead me astray. Finally I got up and looked in the catalogue of the U.L. – No. 17 is *Macbeth*. To my bewilderment I was [245] forced to realize that I knew almost nothing at all of the play, although I had given it as much attention as other plays of Shakespeare's. I only thought of: murderer, Lady Macbeth, witches, "fair is foul" and that at one time I had found Schiller's version of Macbeth very fine. There is no doubt then that I wished to forget the play. The further thought occurred to me that 17 and 34 divided by 17 gives the result 1 and 2. Numbers 1 and 2 in the U.L. are Goethe's *Faust*. Formerly I found very much of Faust in myself.'

We must regret that the physician's discretion did not allow us any insight into the significance of this series of associations. Adler observes that the man did not succeed in synthesizing his remarks. They would seem to us scarcely worth reporting if something had not emerged during their continuation which gave us the key to understanding the number 1734 and the whole series of associations.

'This morning indeed I had an experience that strongly supports the correctness of the Freudian view. My wife, whom I had woken up when I got out of bed the night before, asked me why I had wanted the U.L. catalogue. I told her the story. She found it was all hairsplitting, only – a very interesting point – she accepted *Macbeth*, which I had resisted so forcibly. She said that nothing whatever came to her mind when she thought of a number. I answered: "Let us test it." She gave the number 117. I immediately replied: "17 is a reference to what I have told you. Moreover, I said to you yesterday that when a wife is in her 82nd year and her husband in his 35th year there is gross incompatibility." For the last few days I have been teasing my wife by saying she is a little old woman of 82. 82 + 35 = 117.'

Thus the man, who was not able to find determinants for his own number, found the solution at once when his wife gave him a number purporting to be arbitrarily chosen. In reality the wife understood very well what complex her husband's number was derived from, and chose her own number from the same complex – which was certainly common to both of them, for in his case it concerned their relative ages. It is therefore easy for us to translate the number that had occurred to the husband. It expresses, as Adler suggests, a suppressed wish of his which, [246] fully developed, would run: 'Only a wife of 17 is suitable for a man of 34 like me.'

In case anyone should think too lightly of such 'trifles', I may add that I recently learnt from Dr Adler that a year after the publication of this analysis the man was divorced from his wife.[1]

Adler gives similar explanations of the origin of obsidional numbers.

(4)[2] Moreover, the choice of what have been called 'favourite numbers' is not unrelated to the life of the person concerned and is not without a certain psychological interest. A man who admitted having a special preference for the numbers 17 and 19 was able to specify after a little reflection that at the age of 17 he had gone to the university and so attained the academic freedom he had long desired, and that at 19 he had taken his first long journey and soon after had made his first scientific discovery. But the fixation of this preference occurred a decade later, when the same numbers took on a significance in his erotic life. – Indeed, even those numbers which a person uses especially often in a particular connection, in an apparently arbitrary way, can be traced by analysis to an unexpected meaning. Thus it struck a patient of mine one day that when annoyed he was especially fond of saying: 'I've told you that already from 17 to 36 times', and he asked himself whether there was any motive for it. It at once occurred to him that he was born on the 27th day of the month whereas his younger brother was born on the 26th, and that he had reason to complain that fate so often robbed him of the good things in life in order to bestow them on this younger brother. He therefore represented this partiality on the part of fate by deducting ten from the date of his own birthday and adding it to his brother's. 'I am the elder and yet I am cut short like this.'

(5)[3] I shall dwell longer on analyses of numerical associations, since I
[247] know of no other separate observations that would prove so forcefully the existence of highly composite thought processes which are yet quite unknown to consciousness. At the same time I know of no better example of analyses in which the part contributed by the physician (suggestion) – so often held responsible – is so definitely ruled out. I shall therefore give a report here (with his consent) of the analysis of a number which occurred to a patient of mine. I need only add that he is the youngest child in a large family and at an early age lost his greatly admired father. While he was in a particularly cheerful mood the number 426718

1 In explanation of *Macbeth*, No. 17 in the U.L., Adler informs me that in his seventeenth year this man joined a society of anarchists with regicide as its aim. This was no doubt why the content of *Macbeth* was forgotten. At that time, too, he had invented a code in which letters were replaced by numbers.

2 [Added 1910.]

3 [Added 1912.]

came to his mind, and he asked himself: 'What ideas occur to me in that connection? First of all, a joke I have heard: "When a doctor treats a cold it lasts for 42 days; when it is not treated, it lasts 6 weeks."' This corresponds to the first figures in the number ($42 = 6 \times 7$). In the stoppage that followed this first solution I drew his attention to the fact that the six-figure number he had chosen contained all the first digits except for 3 and 5. He then immediately found the continuation of the interpretation. 'There are 7 of us brothers and sisters, and I am the youngest. In the order of our age, 3 corresponds to my sister A., and 5 to my brother L.; they were my two enemies. As a child I used to pray to God every night for him to remove these two tormenting spirits from life. It seems to me now that in this choice of numbers I was myself fulfilling this wish; 3 and 5, the wicked brother and the hated sister, are passed over.' – If the number represents the order of your brothers and sisters, what does the 18 at the end mean? There were only 7 of you after all. – 'I have often thought that if my father had lived longer I should not have remained the youngest child. If there had been 1 more we should have been 8 and I should have had a younger child after me to whom I should have played the elder brother.'

With this the number was explained, but we had still to establish the connection between the first part of the interpretation and the second one. This followed very easily from the necessary precondition of the last figures: 'if my father had lived longer'. '$42 = 6 \times 7$' signified derision at the doctors who had not been able to help his father, and, in this form, therefore, it expressed his wish for his father to go on living. The whole number [426718], in fact, corresponded to the fulfilment of his two infantile wishes about his family circle – that his bad brother and sister should die and that a baby should be born after him, or, expressed in the shortest form: 'If only those two had died instead of my beloved father!'[1] [248]

(6)[2] Here is a brief example from a correspondent. The manager of a telegraph office in L. writes that his eighteen-and-a-half-year-old son, who wants to study medicine, is already taken up with the psychopathology of everyday life, and is trying to convince his parents of the correctness of my assertions. I reproduce one of the experiments he undertook, without expressing an opinion on the discussion attached to it.

1 In the interests of simplicity I have omitted some of the patient's intermediate associations which were equally to the point.

2 [Added 1920.]

'My son was talking to my wife about what we call "chance" and was demonstrating to her that she could not name any song or any number that really occurred to her simply "by chance". The following conversation ensued. Son: "Give me any number you like." – Mother: "79." – Son: "What occurs to you in that connection?" – Mother: "I think of the lovely hat I was looking at yesterday." – Son: "What did it cost?" – Mother: "158 marks." – Son: "That explains it: 158 ÷ 2 = 79. The hat was too dear for you and no doubt you thought: 'If it were half the price, I would buy it.'"

'To these assertions of my son's I first raised the objection that women are not in general particularly good at figures and that anyway his mother had certainly not worked out that 79 was half 158. His theory was therefore based on the sufficiently improbable fact that the subconscious is better at arithmetic than normal consciousness. "Not at all", was the answer I received; "it may well be that my mother did not work out the sum 158 ÷ 2 = 79, she may perfectly well have happened to see this equation – indeed she may have thought about the hat while dreaming and then realized what it would cost if it were only half the price."'

(7)[1] I take another numerical analysis from Jones (1911*b*, 478). A gentleman of his acquaintance let the number 986 occur to him and then
[249] defied Jones to connect it with anything he thought of. 'Using the free association method he first recalled a memory, which had not previously been present in his mind, to the following effect: Six years ago, on the hottest day he could remember, he had seen a joke in an evening newspaper, which stated that the thermometer had stood at 986° F., evidently an exaggeration of 98.6° F. We were at the time seated in front of a very hot fire from which he had just drawn back, and he remarked, probably quite correctly, that the heat had aroused this dormant memory. However, I was curious to know why this memory had persisted with such vividness as to be so readily brought out, for with most people it surely would have been forgotten beyond recall, unless it had become associated with some other mental experience of more significance. He told me that in reading the joke he had laughed uproariously, and that on many subsequent occasions he had recalled it with great relish. As the joke was obviously a very tenuous one, this strengthened my expectation that more lay behind. His next thought was the general reflection that the conception of heat had always greatly impressed him; that heat was the most important thing in the universe, the source of all life, and so on.

1 [Added 1912. – Jones's original text, which differs in very small points from Freud's version, is given here.]

This remarkable attitude of a quite prosaic young man certainly needed some explanation, so I asked him to continue his free associations. The next thought was of a factory stack which he could see from his bedroom window. He often stood of an evening watching the flame and smoke issuing out of it, and reflecting on the deplorable waste of energy. Heat, fire, the source of life, the waste of vital energy issuing from an upright, hollow tube – it was not hard to divine from such associations that the ideas of heat and fire were unconsciously linked in his mind with the idea of love, as is so frequent in symbolic thinking, and that there was a strong masturbation complex present, a conclusion which he presently confirmed.'

Those who wish to get a good impression[1] of the way in which the material of numbers is worked over in unconscious thinking may be referred to the papers by Jung (1911) and Jones (1912*a*).

In analyses of this kind which I conduct on myself I find two things [250]
particularly striking: firstly, the positively somnambulistic certainty[2] with which I set off for my unknown goal and plunge into an arithmetical train of thought which arrives all at once at the desired number, and the speed with which the entire subsequent work is completed; and secondly, the fact that the numbers are so freely at the disposal of my unconscious thinking, whereas I am a bad reckoner and have the greatest difficulties in consciously noting dates, house numbers and such things. Moreover, in these unconscious thought operations with numbers I find I have a tendency to superstition, whose origin for long remained unknown to me.[3] [Cf. p. 223 *n*. 5 below.]

1 [This paragraph was also added in 1912; the following one dates back to 1901.]

2 [See above, footnote 1, p. 145.]

3 [In 1901 and 1904, this sentence ended: '. . . whose origin is still unknown to me myself.' The paragraph continued: 'I generally come upon speculations about the duration of my own life and the lives of those dear to me; and the fact that my friend in B[erlin] has made the periods of human life the subject of his calculations, which are based on biological units, must have acted as a determinant of this unconscious juggling. I am not now in agreement with one of the premises from which this work of his proceeds; from highly egoistic motives I should be very glad to carry my point against him, and yet I appear to be imitating his calculations in my own way.' The whole of this passage was omitted, and the sentence preceding it was given its present form, from 1907 onwards. The references in the omitted passage are to Freud's friend and correspondent in Berlin, Wilhelm Fliess, and to the analysis of the number 2467 (p. 208 f. above) which (in 1901 and 1904) immediately preceded it. The hypothesis of Fliess's with which Freud had egoistic motives for disagreeing was no doubt that which predicted his death at the age of 51 in 1907 – the year in which the passage was cancelled. See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 391 *n*. 2 and 459, and Ernest Jones's life of Freud (1953, 341).]

[*Footnote added* 1920:] Herr Rudolf Schneider (1920) of Munich has raised an interesting objection to the conclusiveness of such analyses of numbers. He experimented with numbers that were presented to him – for example, with the number that first caught his eye when he opened a history book – or he presented someone else with a number he had chosen; and he then noticed whether associations emerged to the imposed number which had the appearance of having

[251] It will not surprise us[1] to find that not only numbers but also verbal associations of another kind regularly prove on analytic investigation to be fully determined.

(8) A good example of the derivation of an obsidional word – a word that cannot be got rid of – is to be found in Jung (1906). 'A lady told me that for some days the word "Taganrog"[2] had been constantly on her lips [252] without her having any idea where it came from. I asked the lady for information about the affectively stressed events and repressed wishes of the very recent past. After some hesitation she told me that she would very much like a morning-gown [*Morgenrock*], but her husband did not take the interest in it that she had hoped. "*Morgenrock*", "*Tag-an-rock*" [literally "day-on-gown"] – their partial similarity in sound and meaning is obvious. The Russian form was determined by the fact that at about the same time the lady had come to know someone from Taganrog.'

determined it. This was in fact what did happen. In one instance which he relates that concerned himself, the associations provided determinants just as abundant and full of meaning as in our analyses of numbers that have arisen spontaneously, whereas the number in Schneider's experiments, having been presented from outside, called for no determinant. In a second experiment carried out on someone else, he clearly made the problem too easy, for the number he set him was 2, and everybody has *some* material which would enable him to find a determinant for that number. – From his experiments Schneider then draws two conclusions: first, that 'the mind possesses the same potentialities for finding associations to numbers as to concepts'; and secondly, that the emergence of determining associations to numbers that occur to the mind spontaneously does not in any way prove that these numbers originated from the thoughts discovered in the 'analysis' of them. The former conclusion is undoubtedly correct. It is just as easy to find an appropriate association to a number which is presented as it is to a word which is called out – indeed, it is perhaps easier, since the ability of the few digits to form connections is particularly great. The situation in which one finds oneself is then simply that of what are called 'association experiments', which have been studied from the greatest variety of angles by the school of Bleuler and Jung. In this situation the association (reaction) is determined by the word presented (stimulus word). This reaction could, however, still be of very diverse kinds, and Jung's experiments have shown that even these further distinctions are not left to 'chance', but that unconscious 'complexes' participate in the determination if they have been touched on by the stimulus word. – Schneider's second conclusion goes too far. The fact that appropriate associations arise to numbers (or words) which are *presented* tells us nothing more about the origin of numbers (or words) which emerge *spontaneously* than could already be taken into consideration before that fact was known. These spontaneous ideas (words or numbers) may be undetermined, or may have been determined by the thoughts that come out in the analysis, or by other thoughts not disclosed in the analysis – in which last case the analysis will have led us astray. The important thing is to get rid of the impression that this problem is different for numbers from what it is for verbal associations. A critical examination of the problem and with it a justification of the psychoanalytic technique of association lie outside the scope of this book. In analytic practice we proceed on the presupposition that the second of the possibilities mentioned above meets the facts and that in the majority of instances use can be made of it. The investigations of an experimental psychologist (Poppelreuter [1914]) have demonstrated that it is by far the most probable one. See further in this connection the valuable findings in Section 9 of Bleuler's book on autistic thinking (1919).

1 [This sentence, and Examples 8 and 9, were added in 1912.]

2 [The name of a port in South Russia.]

(9) I am indebted to Dr E. Hitschmann for the elucidation of another case, in which in a particular locality a line of poetry repeatedly forced its way up as an association, without its origin and connections having been apparent.

'E., a doctor of law, relates: Six years ago I travelled from Biarritz to San Sebastian. The railway line crosses the River Bidassoa, which at this point forms the frontier between France and Spain. From the bridge there is a fine view – on one side, of a broad valley and the Pyrenees and, on the other, of the distant sea. It was a beautiful, bright summer's day; everything was filled with sun and light, I was on my holiday travels and was happy to be coming to Spain. At that point the following lines occurred to me:

> Aber frei ist schon die Seele,
> Schwebet in dem Meer von Licht.[1]

'I recall that at the time I pondered on where the lines came from and could not recollect the place. To judge by the rhythm the words must have come from a poem, which, however, had entirely escaped my memory. I believe that later, when the lines came to my mind repeatedly, I asked a number of people about them without being able to learn anything.

'Last year, when I was returning from Spain I passed over the same stretch of railway. It was a pitch-dark night and it was raining. I looked out of the window to see whether we were already coming into the frontier station, and noticed that we were on the Bidassoa bridge. Immediately the lines given above returned to my memory, and again I could not recall their origin.

'Several months later when I was at home, I came across a copy of [253]
Uhland's poems. I opened the volume and my glance fell on the lines: "Aber frei ist schon die Seele, schwebet in dem Meer von Licht", which form the conclusion of a poem called "Der Waller".[2] I read the poem and had a very dim recollection of having once known it many years ago. The scene of action is in Spain and this seemed to me to form the only connection between the quoted lines and the place on the railway line described by me. I was only half-satisfied with my discovery and went on mechanically turning the pages of the book. The lines "Aber frei ist

1 ['But the soul is already free, it floats in the sea of light.']

2 ['The Pilgrim'.]

schon . . .” etc. are printed at the bottom of a page. On turning over the page I found a poem on the other side with the title “Bidassoa Bridge”.

‘I may add that the contents of this poem seemed almost more unfamiliar than those of its predecessor, and that its first lines run:

> ‘Auf der Bidassoabrücke steht ein Heiliger altersgrau,
> Segnet rechts die span’schen Berge, segnet links den fränk’schen Gau.’[1]

(B)[2] Perhaps the insight we have gained into the determining of names and numbers that are chosen with apparent arbitrariness may help to solve another problem. Many people, as is well known, contest the assumption of complete psychical determinism by appealing to a special feeling of conviction that there is a free will.[3] This feeling of conviction exists; and it does not give way before a belief in determinism. Like every normal feeling it must have something to warrant it. But so far as I can observe, it does not manifest itself in the great and important decisions of the will: on these occasions the feeling that we have is rather one of psychical compulsion, and we are glad to invoke it on our behalf. [254] (‘Here I stand: I can do no other.’)[4] On the other hand, it is precisely with regard to the unimportant, indifferent decisions that we would like to claim that we could just as well have acted otherwise: that we have acted of our free – and unmotivated – will. According to our analyses it is not necessary to dispute the right to the feeling of conviction of having a free will. If the distinction between conscious and unconscious motivation is taken into account, our feeling of conviction informs us that conscious motivation does not extend to all our motor decisions. *De minimis non curat lex*. But what is thus left free by the one side receives its motivation from the other side, from the unconscious; and in this way determination in the psychical sphere is still carried out without any gap.[5]

1 [‘On the Bidassoa bridge there stands a saint grey with age: on the right he blesses the Spanish mountains, on the left he blesses the Frankish land.’]

2 [Except where otherwise specified, the whole of Sections B and C dates back to 1901.]

3 [Short references to free will occur in the paper on ‘The “Uncanny”’ (1919*h*), *RSE*, **17**, 230, and in Lectures III and VI of the *Introductory Lectures* (1916–17*a*), ibid., **15**, 36 ff. and 88 ff.]

4 [Martin Luther’s declaration at the Diet of Worms.]

5 [*Footnote added* 1907:] These conceptions of the strict determination of apparently arbitrary psychical acts have already borne rich fruit in psychology, and perhaps also in the juridical field. By applying them, Bleuler and Jung have made intelligible the reactions in what is known as the ‘association experiment’, in which the subject of the test, when he hears a word called out (the stimulus word), answers it with one that comes to his mind in connection with it (the reaction), the intervening time being measured (the reaction time). In his *Studies in Word-Association* (1906), Jung has shown what a subtle reagent for psychical states we possess in the association experiment as thus interpreted. Wertheimer & Klein [1904], both pupils of Hans Gross, the Professor of Criminal Law in Prague, have developed out of these experiments a technique for the

(C) Although the motivation of the parapraxes described in the preceding chapters is something of which from the very nature of the case conscious thought must lack knowledge, it would nevertheless be desirable to discover a psychological proof of the existence of that motivation; indeed, for reasons which a closer knowledge of the unconscious reveals, it is probable that such proofs are somewhere discoverable. There are in fact two spheres in which it is possible to demonstrate phenomena that appear to correspond to an unconscious, and therefore displaced, knowledge of that motivation.

(*a*) A striking and generally observed feature of the behaviour of paranoics is that they attach the greatest significance to the minor details of other people's behaviour which we ordinarily neglect, interpret them and make them the basis of far-reaching conclusions. For example, the last paranoic seen by me concluded that there was a general understanding in his environment, because when his train was moving out of the station the people had made a particular movement with one hand. Another noted the way people walked in the street, how they flourished their walking sticks, and so on.[1] [255]

The category of what is accidental and requires no motivation, in which the normal person includes a part of his own psychical performances and parapraxes, is thus rejected by the paranoic as far as the psychical manifestations of other people are concerned. Everything he observes in other people is full of significance, everything can be interpreted. How does he reach this position? Probably here as in so many similar cases he projects on to the mental life of other people what is unconsciously present in his own. In paranoia many sorts of things force their way through to consciousness whose presence in the unconscious of normal and neurotic people we can demonstrate only through psychoanalysis.[2] In a certain sense, therefore, the paranoic is justified in

establishment of the facts in criminal proceedings which is at present being examined by psychologists and jurists. – [Freud had himself recently written a paper on the subject (1906*c*), *RSE*, **9**, 83 ff. Cf. some further remarks on Jung's association experiments in the Editors' Note to that paper, ibid., **9**, 79 f. – Hans Gross (1847–1915) is generally regarded as one of the founders of modern scientific criminal investigation.]

1 From other points of view this interpretation of immaterial and accidental indications given by other people has been classed as a 'delusion of reference'.

2 For example, the phantasies of hysterics concerning sexual and cruel maltreatment correspond, at times even down to details, with the complaints of persecuted paranoics. It is curious, but not unintelligible, that we meet the identical content in the form of reality in the contrivances of perverts for the satisfaction of their desires. [Cf. the discussion of this in the 'Dora' case history (*RSE*, **7**, 42–7), which had been written before the publication of the present work but did not appear till four years later (1905*e*). The substance of this was repeated in a footnote to the first of Freud's *Three Essays* (1905*d*), ibid., **7**, 147 *n.* 2.]

this, for he recognizes something that escapes the normal person: he sees more clearly than someone of normal intellectual capacity, but the displacement on to other people of the state of affairs which he recognizes renders his knowledge worthless. I hope I shall not now be expected to justify the various paranoic interpretations. But the partial
[256] justification which we concede to paranoia in respect of this view taken by it of chance actions will help us towards a psychological understanding of the sense of conviction that the paranoic attaches to all these interpretations. *There is in fact some truth in them*;[1] those, too, of our errors of judgement which are not to be counted as pathological acquire their sense of conviction in just the same way. This feeling is justified for a certain part of the erroneous train of thought, or for its source of origin; and it is then extended by us to the rest of the context.

(*b*) Another indication that we possess unconscious and displaced knowledge of the motivation in chance actions and parapraxes is to be found in the phenomenon of superstition. I will make my meaning clear by a discussion of the small experience that started me on these reflections.

On my return from my holidays my thoughts immediately turned to the patients who were to claim my attention in the year's work that was just beginning. My first visit was to a very old lady for whom I had for many years performed the same professional services twice every day (p. 142 [and p. 153 above]). Owing to the uniformity of the circumstances, unconscious thoughts have very often managed to find expression while I was on my way to the patient and while I was treating her. She is over ninety years old; it is therefore natural to ask oneself at the beginning of each year's treatment how much longer she is likely to live. On the day I am speaking about I was in a hurry and called a cab to take me to her house. Every cabman on the rank in front of my house knew the old lady's address, as they had all often taken me there. But on this day it
[257] happened that the cabman did not draw up in front of her house but in front of a house with the same number in a nearby street which ran

1 [The notion of there being a core of truth in paranoic delusions has a long course of development in Freud's writings. It had already appeared, in a rather different form, in the last few paragraphs of his second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 191 f. Among its later appearances may be mentioned one in the *Gradiva* essay (1907*a*), ibid., **9**, 62 f., and another, which seems to follow closely some of the present discussions, in the paper on 'Some Neurotic Mechanisms' (1922*b*), ibid., **18**, 217 f. In Freud's latest writings the idea was extended. He now applied the notion of a historical core of truth firstly to myths, in the paper on the origin of fire (1932*a*), ibid., **22**, and then to religion, in *Moses and Monotheism* (1939*a*), ibid., **23**, 78 and 116 ff. The subject is also treated, from a more clinical angle, in Section III of the paper on 'Constructions in Analysis' (1937*d*), ibid., **23**, 242–4. In these later discussions Freud elaborates a distinction between 'material' and 'historical' truth. Cf. also 1950*a*, Letter 57.]

parallel and was in fact of a similar appearance. I noticed the error and reproached the cabman with it, and he apologized. Now is it of any significance that I was driven to a house where the old lady was not to be found? Certainly not to me, but if I were *superstitious* I should see an omen in the incident, the finger of fate announcing that this year would be the old lady's last. Very many omens recorded by history have been based on a symbolism no better than this. *I* of course explain the occurrence as an accident without any further meaning.

The case would have been quite different if I had made the journey on foot, and while 'deep in thought', or through 'absent-mindedness', had come to the house in the parallel street instead of the right one. This I should not explain as an accident but as an action that had an unconscious aim and required interpretation. My interpretation of 'going astray' like this would probably have had to be that I did not expect to see the old lady for much longer.

I am therefore different from a superstitious person in the following way:

I do not believe that an event in whose occurrence my mental life plays no part can teach me any hidden thing about the future shape of reality; but I believe that an unintentional manifestation of my own mental activity *does* on the other hand disclose something hidden, though again it is something that belongs only to my mental life [not to external reality]. I believe in external (real) chance, it is true, but not in internal (psychical) accidental events. With the superstitious person it is the other way round. He knows nothing of the motivation of his chance actions and parapraxes, and believes in psychical accidental events; and, on the other hand, he has a tendency to ascribe to external chance happenings a meaning which will become manifest in real events, and to regard such chance happenings as a means of expressing something that is hidden from him in the external world. The differences between myself and the superstitious person are two: first, he projects outwards a motivation which I look for within; second, he interprets chance as due to an event, while I trace it back to a thought. But what is hidden from him corresponds to what is unconscious for me, and the compulsion not to let [258] chance count as chance but to interpret it is common to both of us.[1]

1 [*Footnote added* 1924:] At this point I may quote a neat example which Ossipow (1922) has used for discussing the difference between the superstitious, psychoanalytic and mystical points of view. He had been married in a small Russian provincial town and immediately afterwards started for Moscow with his young wife. At a station two hours before his destination he had a wish to go to the station exit and take a look at the town. The train was due to halt there long enough, as he thought, but when he returned a few minutes later it had already left with his young wife. When he told his old nurse at home of this accident, she shook her head and declared: 'No good will

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. *Because* the superstitious person knows nothing of the motivation of his own chance actions, and *because* the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, *is nothing but psychology projected into the external world*. The obscure recognition[1] (the endopsychic perception, as it were)[2] of psychical factors and relations in the unconscious is mirrored – it is difficult to express it in other terms,
[259] and here the analogy with paranoia must come to our aid – in the construction of a *supernatural reality*, which is destined to be changed back once more by science into the *psychology of the unconscious*. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform *metaphysics* into *metapsychology*.[3] The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no

come of this marriage.' At the time Ossipow laughed at this prophecy. But when, five months later, he was separated from his wife, he could not avoid in retrospect [*nachträglich*] viewing his action in leaving the train as an 'unconscious protest' against his marriage. Years later, the town where this parapraxis happened took on a great importance for him, as a person lived there with whom fate later linked him closely. This person, and even the fact of this person's existence, had been completely unknown to him at the time. But the *mystical* explanation of his behaviour would be that he had left the Moscow train and his wife at that town because the future that was in store for him in relation to this other person was seeking to declare itself.

1 A recognition which, of course, has nothing of the character of a [true] recognition.

2 [The words in parentheses were added in 1907. Freud refers to the passage in the theoretical section of the 'Rat Man' case history (1909*d*), *RSE*, **10**, 175–6. – He had made a similar suggestion under this name of 'endopsychic myths' in a letter to Fliess of December 12, 1897 (Freud, 1950*a*, Letter 78).]

3 [This was the first published appearance of the word. Freud did not use it again for fourteen years – until 'The Unconscious' (1915*e*), *RSE*, **14**, 161. He had, however, originally introduced it in a letter to Fliess of February 13, 1896 (Freud, 1950*a*, Letter 41).]

means perfected *Weltanschauung* that superstition seems so very much out of place; in the *Weltanschauung* of prescientific times and peoples it was justified and consistent.[1]

The Roman who gave up an important undertaking if he saw an ill-omened flight of birds was therefore in a relative sense justified; his behaviour was consistent with his premises. But if he withdrew from the undertaking because he had stumbled on the threshold of his door ('*un Romain retournerait*'[2]) he was also in an absolute sense superior to us unbelievers; he was a better psychologist than we are striving to be. For his stumbling must have revealed to him the existence of a doubt, a countercurrent at work within him, whose force might at the moment of execution subtract from the force of his intention. For we are only sure [260] of complete success if all our mental forces are united in striving towards the desired goal. How did Schiller's Tell, who hesitated so long to shoot the apple on his son's head, answer the governor's question why he had provided himself with a second arrow?

> Mit diesem zweiten Pfeil durchschoss ich – Euch,
> Wenn ich mein liebes Kind getroffen hätte,
> Und *Euer* – wahrlich, hätt' ich *nicht* gefehlt.[3]

(D)[4] Anyone who has had the opportunity of studying the hidden mental impulses [*Seelenregungen*][T] of human beings by means of psycho- *Seele*
analysis can also say something new about the *quality* of the unconscious motives that find expression in superstition. It can be recognized most clearly in neurotics suffering from obsessional thinking or obsessional states – people who are often of high intelligence – that superstition derives from suppressed hostile and cruel impulses.[5] Superstition is in large part the expectation of trouble; and a person who has harboured

1 [Freud's views on the part played by projection in superstition, paranoia and the origins of religion were developed in the case histories of the 'Rat Man' (1909*d*), *RSE*, **10**, 174–9, and of Schreber (1911*c*), ibid., **12**, 57; and in *Totem and Taboo* (1912–13*a*), ibid., **13**, 63 f. and 89 ff.]

2 [This apparent quotation has not been traced.]

3 [Schiller, *Wilhelm Tell*, Act III, Scene 3: 'With this second arrow I would have transfixed – you, if I had struck my dear child; and *you*, truly, I should *not* have missed.']

4 [Section D first appeared in 1907 and was expanded in subsequent editions. The first six paragraphs date back to 1907.]

5 [Compare, for example, the 'Rat Man' (1909*d*), *RSE*, **10**, 177 f. – In Freud's interleaved copy of the 1904 edition (see Editors' Introduction, p. xvi above) the following remarks are to be found at a slightly earlier point in the text. 'Rage, anger and consequently a murderous impulse is the source of superstition in obsessional neurotics: a sadistic component, which is attached to love and is therefore directed against the loved person and repressed precisely because of this link and because of its intensity.' – 'My own superstition has its roots in suppressed ambition (immortality) and in my case takes the place of that anxiety about death which springs from the normal uncertainty of life . . .']

frequent evil wishes against others, but has been brought up to be good and has therefore repressed such wishes into the unconscious, will be especially ready to expect punishment for his unconscious wickedness in the form of trouble threatening him from without.

Though we admit that these remarks of ours in no way exhaust the psychology of superstition, we shall at least have to touch on the question
[261] of whether we are to deny entirely that superstition has any real roots: whether there are definitely no such things as true presentiments, prophetic dreams, telepathic experiences, manifestations of supernatural forces and the like. I am far from meaning to pass so sweeping a condemnation of these phenomena, of which so many detailed observations have been made even by men of outstanding intellect, and which it would be best to make the subject of further investigations. We may even hope that some portion of these observations will then be explained by our growing recognition of unconscious mental processes, without necessitating radical alterations in the views we hold today.[1] If the existence of still other phenomena – those, for example, claimed by spiritualists – were to be established, we should merely set about modifying our 'laws' in the way demanded by the new discovery, without being shaken in our belief in the coherence of things in the world.

In the compass of these discussions the only answer I can give to the questions raised here is a subjective one – that is, one in accordance with my personal experience. To my regret I must confess that I am one of those unworthy people in whose presence spirits suspend their activity and the supernatural vanishes away, so that I have never been in a position to experience anything myself which might arouse a belief in the miraculous. Like every human being, I have had presentiments and experienced trouble, but the two failed to coincide with one another, so that nothing followed the presentiments, and the trouble came upon me unannounced. During the days when I was living alone in a foreign city – I was a young man at the time[2] – I quite often heard my name suddenly called by an unmistakable and beloved voice; I then noted down the exact moment of the hallucination and made anxious enquiries of those at home about what had happened at that time. Nothing had happened. To balance this, there was a later occasion when I went on working with my patients without any disturbance or foreboding while one of my children was in danger of bleeding to death. Nor have I ever been able to regard any of the presentiments reported to me by patients as

1 [*Footnote added* 1924:] See Hitschmann (1910 and 1916).

2 [The reference is to Freud's stay in Paris in 1885–6.]

veridical. – I must, however, confess that in the last few years I have had a few remarkable experiences which might easily have been explained on [262]
the hypothesis of telepathic thought transference.[1]

Belief in prophetic dreams can claim many adherents, because it can take support from the fact that a number of things do in reality turn out in the future in the way in which the wish had previously arranged them in the dream.[2] But there is little that is surprising in that, and as a rule, too, there are extensive differences between the dream and its fulfilment, which the dreamer's credulity prefers to neglect. A good example of a dream which may justly be called prophetic was once brought to me for detailed analysis by an intelligent and truthful woman patient. Her story was that she had once dreamt she met a former friend of hers and family doctor in front of a certain shop in a certain street; and that when next morning she went into the Inner Town [p. 119 above] she in fact met him at the very spot named in the dream. I may observe that no subsequent event proved the importance of this miraculous coincidence,[3] which could not therefore be accounted for by what lay in the future.

Careful questioning established that there was no evidence of her having had any recollection of the dream on the morning after she dreamt it – that is, until after her walk and the meeting. She could produce no objection to an account of what happened which robbed the episode of anything miraculous and left nothing but an interesting psychological problem. She was walking along the street in question one morning and met her old family doctor in front of a particular shop, and thereupon, on seeing him, she felt convinced that she had dreamt the night before of having this meeting at that precise spot. Analysis was then able to show with great probability how she arrived at this sense of conviction, which, according to general rules, cannot fairly be denied a certain right to be [263]
considered authentic. A meeting at a particular place, which has been expected beforehand, amounts in fact to a rendezvous. The old family doctor awakened her memory of former days, when meetings with a *third* person, also a friend of the doctor, had played a very important part in her life. Since then she had continued her relations with that gentleman and had waited for him in vain on the day before the dream

1 [The last sentence was added in 1924. – Freud wrote a good deal on the subject of telepathy at about this time: the posthumous paper on 'Psychoanalysis and Telepathy' (1941*d* [1921]), *RSE*, **18**, 167 ff., the note on 'The Occult Significance of Dreams' (1925*i*), ibid., **19**, 123 ff., and the chapter on 'Dreams and Occultism' in the *New Introductory Lectures* (1933*a*), ibid., **22**, 28 ff., in addition to the paper quoted by him in his next footnote.]

2 [*Footnote added* 1924:] See my paper on 'Dreams and Telepathy' (1922*a*) [ibid., **18**, 189 ff.].

3 [The German '*Zusammentreffen*' means both 'coincidence' and 'meeting'.]

was supposed to have taken place. If I were able to report the circumstances of the case in greater detail it would be easy for me to show that her illusion, when she saw her friend of former days, of having had a prophetic dream was equivalent to some such remark as this: 'Ah! doctor – you remind me now of past times when I never had to wait in vain for N. if we'd arranged a meeting.'[1]

The 'remarkable coincidence' of meeting a person we were at that very moment thinking about is a familiar one. I have observed a simple and easily explained example of it in myself, which is probably a good model for similar occurrences. A few days after I had been awarded the title of professor[2] – which carries considerable authority with it in countries under monarchical rule – my thoughts, while I was walking through the Inner Town, suddenly turned to a childish phantasy of revenge directed against a particular married couple. Some months earlier they had called me in to see their little daughter, who had developed an interesting obsessional symptom following upon a dream. I took a great interest in the case, whose genesis I thought I understood. My offer of treatment was, however, declined by her parents and I was given to understand that they thought of changing over to a foreign authority who effected cures by hypnotism. My present phantasy was that after the total failure of that attempt the parents begged me to start my treatment, saying that now they had complete confidence in me, and so on. I, however, answered: 'Yes, *now* you have confidence in me – now that I too have become a professor. The title has done nothing to alter my
[264] capacities; if you could not make use of me as a university lecturer you can do without me as a professor as well.' – At this point my phantasy was interrupted by a loud 'Good day to you, Professor!' and I looked up and saw walking past me the very married couple on whom I had just taken my revenge by rejecting their offer. Immediate reflection destroyed the impression of something miraculous. I had been walking towards the couple along a wide, straight and almost deserted street; when I was about twenty paces from them I had glanced up for a moment and caught a glimpse of their impressive figures and recognized them, but had set the perception aside – on the pattern of a negative hallucination – for the emotional reasons which then took effect in the phantasy that arose with apparent spontaneity.[3]

1 [This incident is reported in much greater detail in Freud's posthumously published paper 'A Premonitory Dream Fulfilled' (1941*c*), *RSE*, **5**, 562, the manuscript of which is dated November 10, 1899.]

2 [In March, 1902.]

3 [Cf. similar occurrences in the case of the 'Rat Man' (1909*d*), ibid., **10**, 175 and 203.]

Here is another 'resolution of an apparent presentiment', this time from Otto Rank (1912*e*):[1]

'Some time ago I myself experienced an unusual variation of the "remarkable coincidence" of meeting someone one was at the very moment thinking about. Shortly before Christmas I was on my way to the Austro-Hungarian Bank to get some change in the form of ten new silver Kronen for giving as presents. While I was absorbed in ambitious phantasies which had to do with the contrast between my small assets and the piles of money stored in the bank building, I turned into a narrow street in which the bank stood. I saw a car standing at the door and many people going in and out. I said to myself: No doubt the cashiers will have time even for my few Kronen. In any case I shall be quick about it. I shall put down the banknote I want changed and say "Let me have *gold*, please". I immediately noticed my error – I should, of course, have asked for *silver* – and awoke from my phantasies. I was now only a few steps from the entrance and saw a young man coming towards me whom I thought I recognized, but as I am short-sighted I was not yet able to identify him for certain. As he drew nearer I recognized him as a schoolfriend of my *brother's* called *Gold*. Gold's *brother* was a well-known writer from whom I had expected considerable help at the beginning of my literary [265] career. This help, however, had not been forthcoming, and in consequence I failed to win the material success I had hoped for, which had been the subject of my phantasy on the way to the bank. While I was absorbed in my phantasies, therefore, I must have unconsciously perceived the approach of Herr Gold; and this was represented in my consciousness (which was dreaming of material success) in such a form that I decided to ask for gold at the counter, instead of the less valuable silver. On the other hand, however, the paradoxical fact that my unconscious is able to perceive an object which my eyes can recognize only later seems partly to be explained by what Bleuler [1910*a*] terms "complexive preparedness [*Complexbereitschaft*]". This was, as we have seen, directed to material matters and had from the beginning, contrary to my better knowledge, directed my steps to the building where only gold and paper money is changed.'

We must also include[2] in the category of the miraculous and the 'uncanny' the peculiar feeling we have, in certain moments and situations, of having had exactly the same experience once before or of having once

1 [Added 1912.]

2 [What follows from here up to the words 'a wish to improve the situation' on pp. 229–30 dates from 1907.]

before been in the same place, though our efforts never succeed in clearly remembering the previous occasion that announces itself in this way. I am aware that I am merely following loose linguistic usage when I call what arises in a person at such moments a 'feeling'. What is no doubt in question is a judgement, and, more precisely, a perceptual judgement; but these cases have nevertheless a character quite of their own, and we must not leave out of account the fact that what is looked for is never remembered. I do not know whether this phenomenon of '*déjà vu*' has ever been seriously offered in proof of an individual's previous psychical existence; but psychologists have certainly turned their attention to it and have endeavoured to solve the problem in a whole variety of speculative ways. None of the attempted explanations which they have brought forward seems to me to be correct, because none of them takes into consideration anything other than the concomitant manifestations and the conditions which favour the phenomenon. Those psychical processes which according to my observations are alone responsible for the
[266] explanation of '*déjà vu*' – namely, unconscious phantasies – are still generally neglected by psychologists even today.

It is in my view wrong to call the feeling of having experienced something before an illusion. It is rather that at such moments something is really touched on which we have already experienced once before, only we cannot consciously remember it because it has never been conscious. To put it briefly, the feeling of '*déjà vu*' corresponds to the recollection of an unconscious phantasy. There exist unconscious phantasies (or daydreams) just as there exist conscious creations of the same kind which everybody knows from his own experience.

I know that the subject would merit the most exhaustive treatment; but I shall here do no more than give the analysis of a single case of '*déjà vu*' where the feeling was characterized by particular intensity and persistence. A lady who is now thirty-seven claimed to have a most distinct memory of having at the age of twelve and a half paid her first visit to some schoolfriends in the country. When she entered the garden, she had an immediate feeling of having been there before. This feeling was repeated when she went into the reception rooms, so that she felt she knew in advance what room would be the next one, what view there would be from it, and so on. But the possibility that this feeling of familiarity could have owed its origin to an earlier visit to the house and garden, perhaps one in her earliest childhood, was absolutely ruled out and was disproved as a result of her questioning her parents. The lady who reported this was not in search of any psychological explanation,

but saw the occurrence of this feeling as a prophetic indication of the significance for her emotional life which these same schoolfriends later acquired. However, a consideration of the circumstances in which the phenomenon occurred in her shows us the way to another view of the matter. At the time when she paid the visit she knew that these girls had an only brother, who was seriously ill. During the visit she actually set eyes on him, thought he looked very ill and she said to herself that he would die soon. Now, her own only brother had been dangerously ill with diphtheria a few months earlier; during his illness she had spent several weeks away from her parents' house, staying with a relative. She believed that her brother had been with her on this visit to the country; she even thought it had been his first considerable journey after his ill- [267]
ness; but her memory was remarkably uncertain on these points while of all the other details, and in particular of the dress she was wearing that day, she had an ultra-clear picture. [Cf. footnote 3, pp. 11–12 above.][1] Anyone who is well informed will find no difficulty in concluding from these hints that the expectation that her brother would die had at that time played an important part in the girl's thoughts and either had never become conscious or, after the favourable termination of the illness, had succumbed to energetic repression. If things had turned out otherwise, she would have had to wear a different dress – mourning. She found an analogous situation in the home of her friends, whose only brother was in danger of dying soon, as in fact he did shortly after. She ought to have remembered consciously that she herself had lived through this situation a few months before: instead of remembering it – which was prevented by repression – she transferred her feeling of remembering something to her surroundings, the garden and the house, and fell victim to the '*fausse reconnaissance*' of having seen all this exactly the same once before. From the fact that repression occurred we may conclude that her former expectation of her brother's death had not been far removed from a wishful phantasy. She would then have been the only child. In her later neurosis she suffered most severely from a fear of losing her parents, behind which, as usual, analysis was able to reveal the unconscious wish with the same content.

I have been able in a similar way to derive my own fleeting experiences of '*déjà vu*' from the emotional constellation of the moment. 'This would once more be an occasion for wakening the (unconscious and unknown) phantasy which was formed in me at this or that time as a wish to

1 [Cf. Freud (1937*d*), *RSE*, **23**, 241.]

improve the situation.' – This explanation of '*déjà vu*'[1] has so far been taken into consideration by only one observer. Dr Ferenczi, to whom the third [1910] edition of this book is indebted for so many valuable contributions, writes to me on this subject as follows: 'From my own case, as well as that of others, I have convinced myself that the unaccountable
[268] feeling of familiarity is to be traced to unconscious phantasies of which one is unconsciously reminded in a situation of the present time. With one of my patients what happened was apparently something different, but in reality it was quite analogous. This feeling returned to him very often, but it regularly proved to have originated from a *forgotten* (*repressed*) *portion of a dream of the preceding night*. It seems therefore that "*déjà vu*" can derive not only from daydreams but from night dreams as well.'

I have later learnt that Grasset (1904) has given an explanation of the phenomenon which comes very close to my own.[2]

In 1913[3] I wrote a short paper describing another phenomenon that is very similar to '*déjà vu*' [1914*a*]. This is '*déjà raconté*', the illusion of having already reported something of special interest when it comes up in the course of psychoanalytic treatment. On these occasions the patient maintains with every sign of subjective certainty that he has already recounted a particular memory a long time ago. The physician is, however, sure of the contrary and is as a rule able to convince the patient of his error. The explanation of this interesting parapraxis is probably that the patient has felt an urge to communicate this information and intended to do so, but has failed to carry it into effect, and that he now takes the memory of the former as a substitute for the latter, the carrying out of his intention.

A similar state of affairs, and probably also the same mechanism, is to be seen in what Ferenczi (1915*a*) has called 'supposed' parapraxes. We believe there is something – some object – that we have forgotten or mislaid or lost; but we are able to convince ourselves we have done nothing of the kind and that everything is as it should be. For example, a woman patient returns to the doctor's room, giving as a reason that she wants to collect the umbrella she has left behind there; but the doctor sees that

1 [The rest of this paragraph and the following one were added as footnotes in 1910 and 1917, and put in the text in 1924.]

2 [A special case of '*déjà vu*', with a quite different explanation, can be found mentioned in a passage added in 1909 to *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 357. For a discussion of an allied phenomenon – that of 'depersonalization' – see Freud's paper on 'A Disturbance of Memory on the Acropolis' (1936*a*), ibid., **22**, 259 ff.]

3 [The last two paragraphs in this section were added in 1924.]

she is, in fact, holding it in her hand.[1] There was therefore an impulse [*Impuls*] towards this parapraxis, and the impulse was sufficient to serve as a substitute for its actual execution. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper. [269]

(E)[2] When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values.[3] The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 93 ('Across Europe in a Tub') gave me the opportunity of showing how a [270]

1 [This example is taken from Ferenczi's paper.]

2 [The first two paragraphs in this section date back to 1901.]

3 [Cf. some remarks of Freud's in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 468–9, and in two later papers on dream interpretation, 1911*e* (ibid., **12**, 85–6) and 1925*i* (ibid., **19**, 115 ff.).]

symptom that is at first insoluble becomes accessible to analysis when the *real interest* in the repressed thoughts has passed away.[1] As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

On the other hand, we must not overlook the fact that repressed thoughts and impulses [*Regungen*] certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slipping on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and
[271] the physiological and psychophysical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can – like the unconscious motive, and in place of it – create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question.

Nor is it my purpose[2] to exaggerate the differences, sufficiently large as they are, between the psychoanalytic and the popular view of

1 [*Footnote added* 1924:] At this point very interesting problems of an *economic* nature come in, questions taking into consideration the fact that the psychical processes aim at gaining pleasure and removing unpleasure. There is already an economic problem in how it becomes possible by way of substitutive associations to recapture a name that has been forgotten through motives of unpleasure. An excellent paper by Tausk (1913*a*) gives good examples of how the forgotten name becomes accessible once more if one succeeds in connecting it with a pleasurably toned association, which can counterbalance the unpleasure to be expected from the reproduction of the name.

2 [This paragraph was added in 1917.]

parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen – in which, perhaps, words are merely contracted, or words and letters left out – the more complicated interpretations come to nothing. From the point of view of psychoanalysis we must maintain that *some* disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact, it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

(F)[1] Since our discussion of slips of the tongue [p. 46 ff. above] we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psychoanalysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps [272]
will show us in a moment.[2] Here several questions can be raised which I will at least bring forward and describe in outline. (1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

1 [With the exception of footnote 2 below and footnote 3, p. 235, the remainder of the chapter dates back to 1901.]

2 [*Footnote added* 1924:] This book is of an entirely popular character; it merely aims, by an accumulation of examples, at paving the way for the necessary assumption of *unconscious yet operative* mental processes, and it avoids all theoretical considerations on the nature of this unconscious.

I will begin by bringing together some material for answering the last question. In discussing the examples of slips of the tongue [p. 46 ff. above] we found it necessary to go beyond the content of what was intended to be said, and were obliged to look for the cause of the speech disturbance in something outside the intention. What this was was obvious in a number of cases, and was known to the speaker's consciousness. In the examples that seemed simplest and most transparent it was another composition of the same thought – one which sounded as if it had an equal right [to express the thought], and which disturbed the expression of the thought without its being possible to explain why the one version had succumbed and the other had won the day. (These are Meringer & Mayer's 'contaminations' [p. 46 f.].) In a second group of cases the motive for the defeat of one version was a consideration which, however, did not prove strong enough to withhold it completely ('*zum Vorschwein gekommen*' [p. 49]). The version which was withheld was perfectly conscious too. Only of the third group can it be asserted unreservedly that the disturbing thought differed from the one intended, and only in their case can a distinction which is apparently essential be established. The disturbing thought is either connected with the disturbed thought by thought associations [*Gedankenassoziationen*] (disturbance as a result of internal contradiction), or it is unrelated to it in its nature and the disturbed word happens to be connected with the disturbing thought
[273] – which is *often* unconscious – by an unexpected *external* association. In the examples I have given from my psychoanalyses the entire speech is under the influence of thoughts which have become active but have at the same time remained entirely unconscious; either these are betrayed by the disturbance itself ('*Klapperschlange*' – '*Kleopatra*' [p. 57]) or they exercise an indirect influence by making it possible for the different parts of the consciously intended speech to disturb each other ('*Ase natmen*', where '*Hasenauer* Street' and reminiscences of a Frenchwoman are in the background [p. 54 f.]). The withheld or unconscious thoughts from which the disturbance in speech derives are of the most varied origin. This survey therefore does not enable us to generalize in any direction.

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the '*Apfe*' [p. 53]). It would, however, be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem

can be obtained from the examples themselves. I should, however, refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities[1] which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. 'Across Europe in a Tub' [p. 93 above] is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the 'switch-word'[2] '*Beförderung*' to form a connection with the [274]
indifferent and innocent topic that was being read. In the case of 'Burckhard' [p. 102] the name itself forms a 'switch-word' of this kind.

There is no doubt that disturbances in the functions of speech occur more readily, and make smaller demands on the disturbing forces, than do those in other psychical activities. [Cf. p. 191.]

One is on different ground when it comes to examining forgetting in its proper sense – that is, the forgetting of past experiences. (To distinguish them from forgetting in this stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapters I and II, as 'slipping the memory', and the forgetting of intentions as 'omissions'.) The basic determinants of the *normal* process of forgetting are unknown.[3] We are also reminded that not everything is forgotten [275]

1 [I.e. activities from which conscious attention is withdrawn. Cf. p. 114 f. above.]

2 [This term (in German '*Wechsel*') is used at two or three points in the contemporary 'Dora' case history (1905*e*), e.g. *RSE*, **7**, 58 *n*. 2. Freud also uses the term 'verbal bridge', as, for instance, above on p. 43. So too in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 163. Cf. similarly 'associative bridge' on p. 95 above.]

3 [*Footnote added* 1907:] I may perhaps put forward the following suggestions as regards the mechanism of forgetting in its proper sense. Mnemic material is subject in general to two influences, condensation and distortion. Distortion is the work of the dominant trends in mental life, and is directed above all against the memory traces which have remained affectively operative and which show considerable resistance to condensation. The traces that have grown indifferent succumb unresistingly to the process of condensation; yet it can be observed that, in addition to this, the distorting trends feed on the indifferent material if they have remained unsatisfied at the place at which they sought to manifest themselves. As these processes of condensation and distortion continue for long periods, during which every fresh experience acts in the direction of transforming the mnemic content, it is generally thought that it is time which makes memory uncertain and indistinct. It is highly probable that there is no question at all of there being any

that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, insofar as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover, we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be *surmised* in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counterwill can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. [Cf. pp. 233–4 above.] Either the counterwill is turned directly against the intention (in cases where the latter's purpose is of some importance), or
[276] it is unrelated in its nature to the intention itself and establishes its connection with it by means of an *external* association (in the case of intentions that are almost indifferent).

The same conflict governs the phenomena of bungled actions. The impulsion [*Impuls*] which manifests itself in disturbing the action is often a counter-impulsion, but still more often it is an entirely unrelated one,

direct function of time in forgetting. [For an earlier draft of some of these ideas, cf. footnote 2, p. 117 above. The gist of these remarks had already been put forward in a short footnote to Chapter VI of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 146. An interesting discussion of the process by which affective memories are forgotten can be found in Section 3 of Part III of Freud's 'Project' of 1895 (Freud, 1950*a*).] – In the case of *repressed* memory traces it can be demonstrated that they undergo no alteration even in the course of the longest period of time. The unconscious is quite timeless. The most important as well as the strangest characteristic of psychical fixation is that all impressions are preserved, not only in the same form in which they were first received, but also in all the forms which they have adopted in their further developments. This is a state of affairs which cannot be illustrated by comparison with another sphere. Theoretically every earlier state of the mnemic content could thus be restored to memory again, even if its elements have long ago exchanged all their original connections for more recent ones. [This seems to be the earliest explicit mention of the 'timelessness' of the unconscious. See an Editors' footnote to the metapsychological paper on the unconscious (1915*e*), *RSE*, **14**, 165 *n.* 3. – An attempt at an illustration, by a comparison taken from the archaeology of the city of Rome, was made by Freud and abandoned as useless in Chapter I of his late work, *Civilization and its Discontents* (1930*a*), where there is another long discussion of the nature of memory and forgetting; ibid., **21**, 63 ff.]

which merely takes the opportunity of achieving expression by disturbing the action while it is being carried out. The cases where the disturbance results from an internal contradiction are the more significant ones; they also involve the more important actions.

In chance actions or in symptomatic actions the internal conflict becomes less and less important. These motor manifestations, to which consciousness attaches little value, or which it overlooks entirely, thus serve to express a wide variety of unconscious or withheld impulses [*Regungen*]; for the most part they are symbolic representations of phantasies or wishes.

In regard to the first question – as to what is the origin of the thoughts and impulses which find expression in parapraxes [p. 233 above] – we can say that in a number of cases it is easy to show that the disturbing thoughts are derived from suppressed [*unterdrückten*] impulses in mental life. In healthy people, egoistic, jealous and hostile feelings and impulsions, on which the pressure of moral education weighs heavily, make frequent use of the pathway provided by parapraxes in order to find some expression for their strength, which undeniably exists but is not recognized by higher mental agencies. Acquiescence in these parapraxes and chance actions is to a large extent equivalent to a compliant tolerance of the immoral. Among these suppressed impulses no small part is played by the various sexual currents. That these particular ones should in fact appear so rarely among the thoughts disclosed by analysis in my examples is an accident of my material. Since the examples I have analysed are to a great extent taken from my own mental life, the selection was partial from the first and aimed at excluding sexual matters. At other times it appears to be from perfectly innocent objections and considerations that the disturbing thoughts arise.

We have now reached the moment for answering the second question – that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought [277]
[p. 233]. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in relation to admissibility to consciousness: in the question, that is, of the greater or lesser degree to which they bear the marked character of being 'repressed' ['*Verdrängten*']. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration that the thought in question is not properly relevant to the matter in hand,

appear, as motives for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable – and therefore the less inadmissible to consciousness – the thought finding expression in it, the easier it is to explain the phenomenon, once one's attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.

We are therefore no doubt justified in taking the result of this last enquiry as evidence that the satisfactory explanation of the psychological determinants of parapraxes and chance actions is to be looked for along other lines and by a different approach. The indulgent reader may accordingly see in these discussions signs of the broken edges where this subject has been somewhat artificially detached from a wider context.

(G) A few words should indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream formation which I have discussed in the chapter on the 'dream-work' in
[278] my *Interpretation of Dreams*. In both cases we find condensations and compromise formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases *the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.*

An important conclusion can be drawn from this conformity. The peculiar mode of working, whose most striking achievement we see in the content of dreams, cannot be attributed to the sleeping state

of mental life if we possess such abundant evidence in the form of parapraxes that it operates during our waking life as well. The same connection also forbids our assuming that these psychical processes, which strike us as abnormal and strange, are determined by a deep-seated decay in mental activity or by pathological states of functioning.[1]

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements – namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic – acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at – *formes frustes*[2] of the neuroses: cases in which the symptoms [279]
are few, or occur rarely or not severely – in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way – that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life – this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

1 See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 543–4.

2 ['Blurred forms.' The expression is derived from Charcot. The French word '*fruste*' applies primarily to coins or medals that are 'rubbed' or 'worn'.]

But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: *the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself*.

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

INDEX OF PARAPRAXES

This list does not entirely follow Freud's grouping of parapraxes according to the titles of the various chapters. Items have been classified under the most appropriate headings, regardless of whereabouts they appear in the book. The source of each parapraxis is given in brackets where it is other than Freud himself.

Bungled Actions
- ball misdirected (Fontane), 153
- breaking Egyptian figure, 146–7
- breaking flower vase (Jekels), 147–9
- breaking hydraulic press, 150–1

Complete Neuroscientific Works of Sigmund Freud, 46 *n.* 2, 102 *n.* 1, 114 *n.* 5, 139 *nn.* 1 & 2
Complex
  family, 21, 35
  Jung's use of term, 95 *n.* 1
  'personal', 20 and *n.* 2, 22, 27, 35
  'professional', 21, 35
'Complexive preparedness', 227
Compromise formations
  in dreams, 238–9
  parapraxes as, 3–4, 46–7, 49–51, 53–4, 62–3, 170, 201–2, 238–9
Condensation
  in dreams, 51, 234–5, 238–9
  in forgetting, 117 *n.* 2, 235 *n.* 3
  in slips of tongue and pen, 51, 53, 58–9, 66–7, 90–1, 108–9, 234–5, 238–9
Conflict, internal
  and speech disturbance, 87
  resolved by psychoanalysis, 161–2
Consciousness
  admissibility to, 6, 237–8
  exclusion from, in repression, 3–5, 188–9, 239–40
  repressed material brought to, by psychoanalysis, 53, 205
Contagiousness
  of forgetting, 27, 36, 54
  of slips of the tongue, 54
'Contaminations' in slips of the tongue, 47, 49–51, 53, 66, 234
Contradiction, internal, as source of parapraxes, 12–13, 35–6, 51–2, 74–5, 135, 201–2, 234, 236–7
Conviction, sense of, 218–20
Convulsions as neurotic symptoms, 100
Correggio, 58
Counterwill, 134–5, 137–8, 202, 223, 236
Czeszer, *L.*, 62–4

Daniel (in *Die Räuber*), 21–2
Darwin, *C.* (*see also* Bibliography), 129
Dattner, *B.* (*see also* Bibliography), 111–12, 174, 179
Daudet, *A.*, 129–30
Daydreams (*see also* Phantasies), 129–30, 142, 228–30
Day's residues, 56–7
Death
  and sexuality antithetically linked, 3–4, 12 *n.* 1, 43 *n.* 2
  thoughts of, 34, 223 *n.* 5
Death wish
  expressed in choice of numbers, 212–13
  expressed in parapraxes, 89–91, 105–6, 162
  expressed in phantasy, 229
Defensive mechanisms, 71 *n.* 5, 128, 138, 156
Deferred action (see *Nachträglichkeit*)
Déjà raconté, 230
Déjà vu, 130–1, 227–30
Delphi, 183 *n.* 1
Delusions
  of persecution, 219 *n.* 2
  of reference, 96, 219 *n.* 1
  paranoic, 129, 219 *nn.* 1 & 2, 220 *n.* 1
Dementia praecox, 88, 90
Democritus, 184
Depersonalization, 230 *n.* 2
Determinism, principle of, xvi, 40–1, 207–18
  applied to names chosen 'at random', 207–8, 218
  applied to numbers chosen 'at random', 207, 208–16, 218
  applied to verbal associations, 216
Deuticke, *F.* (publisher), 138 and *n.* 3, 139 *n.* 1
Dido, 9, 12
Diogenes, 93
Disowning equated with forgetting what is unpleasant, 126–7
Displacement
  in childhood memories, 38–9, 41

Displacement (*cont.*)
in forgetting, 1–5, 27, 40
in paranoic delusions, 219–20, 222
of affect, 45
retroactive, 39
Distortion
in childhood memories, 41
in forgetting, 117 *n.* 2
in formation of parapraxes, 15, 19, 56, 71–3, 102, 112, 187–90, 197
of names an insult to their owners, 72–3, 102–3, 120
Doctors
bungled actions by, 153–4
identification with, motive for adopting medical profession, 169–70
slips of the pen by, in writing prescriptions, 106–8, 110–11

Three Essays on the Theory of Sexuality

Title page of the first edition of
Three Essays on the Theory of Sexuality

It was published in 1905. Looking back twenty years later, Freud wrote in his *Autobiographical Study*: 'The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult.' NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

Fragment of an Analysis of a Case of Hysteria

(1905 [1901])

'Fragment of an Analysis of Hysteria (Dora)'
2006 *PMC*, *The Psychology of Love*, 1–109. (Tr. Shaun Whiteside.)

The present translation is a revised and corrected reprint of the *SE* version. A few changes and additions (including footnotes dated 1923) were made in the 1924 German edition.

Though this case history was not published until October and November, 1905, the greater part of it was written in January, 1901, while Freud was simultaneously engaged on the final stages of his *Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**. His letters to Wilhelm Fliess (Freud, 1950*a*) contain a quantity of contemporary evidence on the subject.

On October 14, 1900 (Letter 139),[1] Freud tells Fliess that he has recently begun work with a new patient, 'an eighteen-year-old girl'. This girl was evidently 'Dora', and, as we know from the case history itself (p. 13 *n*. 1 below), her treatment came to an end some three months later, on December 31. All through the same autumn he had been

1 References to the Fliess letters are to the 1954 translation by Mosbacher & Strachey. (See *RSE*, **1**, xxx.)

engaged on his *Psychopathology of Everyday Life* (1901*b*), and on January 10 he writes that he is now engaged simultaneously on two works: the *Everyday Life* and 'Dreams and Hysteria, a Fragment of an Analysis', which, as we are told in Freud's Preface (p. 10 below), was the original title of the present paper. On January 25 (Letter 140) he writes:

[4] 'Dreams and Hysteria' was completed yesterday. It is a fragment of an analysis of a case of hysteria, in which the explanations are grouped round two dreams. So that it is in fact a continuation of the dream book. [*The Interpretation of Dreams* (1900*a*) had been published a year earlier.] It further contains solutions to hysterical symptoms and considerations on the sexual organic basis of the whole condition. Anyhow, it is the most subtle thing I have yet written and will produce an even more horrifying effect than usual. One does one's duty, however, and what one writes is not for the passing day. The work has already been accepted by Ziehen.

The latter was joint editor, with Wernicke, of the *Monatsschrift für Psychiatrie und Neurologie*, in which the paper ultimately appeared. A few days later, on January 30 (Letter 141), Freud continues:

I hope you will not be disappointed by 'Dreams and Hysteria'. Its main concern is still with psychology – an estimation of the importance of dreams and an account of some of the peculiarities of unconscious thinking. There are only glimpses of the organic side – the erotogenic zones and bisexuality. But it [the organic side] is definitely mentioned and recognized and the way is paved for an exhaustive discussion of it another time. The case is a hysteria with *tussis nervosa* and aphonia, which can be traced back to the characteristics of a thumbsucker; and the principal part in the conflicting mental processes is played by the opposition between an attraction towards men and one towards women.

These extracts show how this paper forms a link between *The Interpretation of Dreams* and the *Three Essays*. It looks back to the one and forward to the other.

Freud had finished writing the paper early in 1901 and clearly intended at that stage to publish it straight away. On June 9, he reported to Fliess that '"Dreams and Hysteria" has been sent off, and will meet the gaze of an astonished public in the autumn'. Yet, for reasons which are not entirely known to us, he, in fact, deferred publication for another four years. We learn from Ernest Jones (1955, 286) that the work was sent first (before Ziehen had actually set eyes on it) to the *Journal für Psychologie und Neurologie*, whose editor, Brodmann, returned it, apparently on the grounds that it was a breach of medical discretion. This point of view may well have

had some influence on Freud, but it seems probable that a concern to prevent his patient from suffering any injury – however remote the likelihood – was a more important factor than was any respect for conventional medical behaviour. Freud's own attitude to this problem is very clearly expressed in his 'Prefatory Remarks' (pp. 7–13 below).

There is no means of deciding the extent to which Freud revised the paper before its ultimate publication in 1905. All the internal evidence suggests, however, that he changed it very little. The last section of the 'Postscript' (pp. 106–8) was certainly added, as well as some passages at least in the 'Prefatory Remarks' and certain of the footnotes. But apart from these small additions it is fair to regard the paper as representing Freud's technical methods and theoretical views at the period immediately after the publication of *The Interpretation of Dreams*. It may seem surprising that his theory of sexuality had reached such a point of development so many years before the appearance of the *Three Essays* (1905*d*), which were actually published almost simultaneously with this paper. But footnote 2 on p. 46 below explicitly vouches for the fact. Moreover, readers of the Fliess correspondence will be aware that much of this theory was in existence at an even earlier date. To take only a single instance, Freud's dictum about psychoneuroses being the 'negative' of perversions (p. 46) occurs in almost the same words in a letter to Fliess of January 24, 1897 (Letter 57). Even before this the idea is hinted at, in a letter of December 12, 1896 (Letter 52), which also introduces the notion of 'erotogenic zones' and adumbrates the theory of 'component drives'. [5]

It is curious that four times in his later writings Freud assigns his treatment of 'Dora' to the wrong year – to 1899 instead of 1900. The mistake occurs twice in the first section of his 'History of the Psychoanalytic Movement' (1914*d*) and is repeated twice in the footnote which he added to the case history in 1923 (p. 13 *n*. 1). There can be no question that the autumn of 1900 was the correct date, since, quite apart from the external evidence quoted above, the date is absolutely fixed by the '1902' given at the end of the paper itself (p. 107).

This chronological summary, based on the data given in the case history, may make it easier for the reader to follow the events in the narrative:

1882		'Dora' born.
1888	(*Aet*. 6)	Father ill with TB. Family move to B——.
1889	(*Aet*. 7)	Bedwetting.
1890	(*Aet*. 8)	Dyspnoea.
1892	(*Aet*. 10)	Father's detached retina.
1894	(*Aet*. 12)	Father's confusional attack. His visit to Freud. Migraine and *tussis nervosa*. [6]
1896	(*Aet*. 14)	Scene of the kiss.
1898	(*Aet*. 16)	(Early summer:) 'Dora's' first visit to Freud. (End of June:) Scene by the lake. (Winter:) Death of Aunt. 'Dora' in Vienna.[1]
1899	(*Aet*. 17)	(March:) Appendicitis. (Autumn:) Family leave B—— and move to manufacturing town.

1 This chronological summary is consistent with Freud's case history and is therefore retained. Factual errors revealed by subsequent biographical research are reported in the Editors' footnotes below.

1900 (*Aet*. 18)	Family move to Vienna. Suicide threat. (October to December:) Treatment with Freud.
1901	(January:) Case history written.
1902	(April:) 'Dora's' last visit to Freud.
1905	Case history published.

Some aspects of 'Dora's' subsequent life history are described by Dr Felix Deutsch, whom she consulted in 1923 (Deutsch, 1957). The social and biographical background of the case have been thoroughly researched by Rogow (1978, 1979), Loewenberg (1983), Decker (1991), Roazen (1994) and Mahony (1996). As with the *Studies on Hysteria*, we have drawn upon this research for the Editors' footnotes in this edition, without, however, revealing the identities of Freud's patients. (See the Preface to the Revised Edition, *RSE*, **1**, xxx.)

PREFATORY REMARKS

In 1895 and 1896[1] I put forward certain views upon the pathogenesis of [7]
hysterical symptoms and upon the mental processes occurring in hysteria. Since that time several years have passed. In now proposing, therefore, to substantiate those views by giving a detailed report of the history of a case and its treatment, I cannot avoid making a few introductory remarks, for the purpose partly of justifying from various standpoints the step I am taking, and partly[t] of diminishing the expectations to which it will give rise.

No doubt it was awkward that I was obliged to publish the results of my enquiries without there being any possibility of other workers in the field testing and checking them, particularly as those results were of a surprising and by no means gratifying character. But it will be scarcely less awkward now that I am beginning to bring forward some of the material upon which my conclusions were based and make it accessible to the judgement of the world. I shall not escape blame by this means. Only, whereas before I was accused of giving *no* information about my patients, now I shall be accused of giving information about my patients which ought not to be given. I can only hope that in both cases the critics will be the same, and that they will merely have shifted the pretext for their reproaches; if so, I can resign in advance any possibility of ever removing their objections.

Even if I ignore the ill-will of narrow-minded critics such as these, the presentation of my case histories remains a problem which is hard for me to solve. The difficulties are partly of a technical kind, but are partly due to the nature of the circumstances themselves. If it is true that the causes of hysterical disorders are to be found in the intimacies of the patients' psychosexual life, and that hysterical symptoms are the expression of [8]
their most secret and repressed wishes, then the complete elucidation of a case of hysteria is bound to involve the revelation of those intimacies and the betrayal of those secrets. It is certain that the patients would never have spoken if it had occurred to them that their admissions might possibly be put to scientific uses; and it is equally certain that to ask them themselves for leave to publish their case would be quite unavailing. In such circumstances persons of delicacy, as well as those who were merely

1 [E.g. in *Studies on Hysteria* (Breuer & Freud, 1895*d*), *RSE*, **2**, and 'The Aetiology of Hysteria' (Freud, 1896*c*), ibid., **3**, 199 ff.]

timid, would give first place to the duty of medical discretion and would declare with regret that the matter was one upon which they could offer science no enlightenment. But in my opinion the physician has taken upon himself duties not only towards the individual patient but towards science as well; and his duties towards science mean ultimately nothing else than his duties towards the many other patients who are suffering or will some day suffer from the same disorder. Thus it becomes the physician's duty to publish what he believes he knows of the causes and structure [*Gefüge*][T] of hysteria, and it becomes a disgraceful piece of cowardice on his part to neglect doing so, as long as he can avoid causing direct personal injury to the single patient concerned. I think I have taken every precaution to prevent my patient from suffering any such injury. I have picked out a person the scenes of whose life were laid not in Vienna but in a remote provincial town, and whose personal circumstances must therefore be practically unknown in Vienna. I have from the very beginning kept the fact of her being under my treatment such a careful secret that only one other physician – and one in whose discretion I have complete confidence[1] – can be aware that the girl was a patient of mine. I have waited for four whole years since the end of the treatment and have postponed publication till hearing that a change has taken place in the patient's life of such a character as allows me to suppose that her own interest in the occurrences and psychological events which are to be related here may now have grown faint.[2] Needless to say, I have allowed no name to stand which could put a non-medical reader upon the scent; and the publication of the case in a purely scientific and technical periodical should, further, afford a guarantee against unauthorized readers of this sort. I naturally cannot prevent the patient herself
[9] from being pained if her own case history should accidentally fall into her hands. But she will learn nothing from it that she does not already know; and she may ask herself who besides her could discover from it that she is the subject of this paper.

I am aware that – in this city, at least – there are many physicians who (revolting though it may seem) choose to read a case history of this kind not as a contribution to the psychopathology of the neuroses, but as a *roman à clef* designed for their private delectation. I can assure readers of this species that every case history which I may have occasion to publish in the future will be secured against their perspicacity by similar

1 [Probably Fliess (see p. 3 above) but, shortly before its publication, Freud also discussed the case with Dr Oscar Rie who – being Viennese – is more likely to have been able to identify her.]

2 [This possibly refers to her marriage on December 6, 1903, or the birth of her son on April 2, 1905.]

guarantees of secrecy, even though this resolution is bound to put quite extraordinary restrictions upon my choice of material.

Now in this case history – the only one which I have hitherto succeeded in forcing through the limitations imposed by medical discretion and unfavourable circumstances – sexual questions will be discussed with all possible frankness, the organs and functions of sexual life will be called by their proper names, and the pure-minded reader can convince himself from my description that I have not hesitated to converse upon such subjects in such language even with a young woman[t]. Am I, then, to defend myself upon this score as well? I will simply claim for myself the rights of the gynaecologist – or rather, much more modest ones – and add that it would be the mark of a singular and perverse prurience to suppose that conversations of this kind are a good means of exciting or of gratifying sexual desires. For the rest, I feel inclined to express my opinion on this subject in a few borrowed words:

'It is deplorable to have to make room for protestations and declarations of this sort in a scientific work; but let no-one reproach me on this account but rather accuse the spirit of the age, owing to which we have reached a state of things in which no serious book can any longer be sure of survival.' (Schmidt, 1902, Preface.)

I will now describe the way in which I have overcome the *technical* difficulties of drawing up the report of this case history. The difficulties are very considerable when the physician has to conduct six or eight psychotherapeutic treatments of the sort in a day, and cannot make notes during the actual session with the patient for fear of shaking the patient's confidence and of disturbing his own view of the material under observation. Indeed, I have not yet succeeded in solving the problem [10] of how to record for publication the history of a treatment of long duration. As regards the present case, two circumstances have come to my assistance. In the first place the treatment did not last for more than three months;[1] and in the second place the material which elucidated the case was grouped around two dreams (one related in the middle of the treatment and one at the end). The wording of these dreams was recorded immediately after the session, and they thus afforded a secure point of attachment for the chain of interpretations and recollections which proceeded from them. The case history itself was only committed to writing from memory after the treatment was at an end, but while my recollection of the case was still fresh and was heightened by my interest

1 [The treatment appears to have lasted precisely eleven weeks.]

in its publication.[1] Thus the record is not absolutely – phonographically – exact, but it can claim to possess a high degree of trustworthiness.[2] Nothing of any importance has been altered in it except in some places the order in which the explanations are given; and this has been done for the sake of presenting the case in a more connected form.

I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well adapted for showing how dream interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (*The Interpretation of Dreams*) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists[t] at the present time. In this instance there was no validity in the objection that the material upon which I had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For everyone can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt
[11] from the instructions and examples which I have given. I must once more insist, just as I did at that time,[3] that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no-one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt at

1 [Freud had intended to publish it immediately after writing it. (See p. 4 f. above.)]

2 [A few factual errors revealed by the research of Rogow (1978, 1979), Loewenberg (1983), Decker (1991), Roazen (1994) and Mahony (1996), primarily concerning chronology, are corrected in editorial footnotes to the text.]

3 [Preface to the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, xxvii.]

explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new things which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

Nevertheless, it would be wrong to suppose that dreams and their interpretation [*Deutung*][T] occupy such a prominent position in all psychoanalyses as they do in this example.[1]

While the case history before us seems particularly favoured as regards the utilization of dreams, in other respects it has turned out poorer than I could have wished. But its shortcomings are connected with the very circumstances which have made its publication possible. As I have already said, I should not have known how to deal with the material involved in the history of a treatment which had lasted, perhaps, for a whole year. The present history, which covers only three months, could be recollected and reviewed; but its results remain incomplete in more [12]
than one respect. The treatment was not carried through to its appointed end, but was broken off at the patient's own wish when it had reached a certain point. At that time some of the problems of the case had not even been attacked and others had been only imperfectly elucidated; whereas, if the work had been continued, we should no doubt have obtained the fullest possible enlightenment upon every particular of the case. In the following pages, therefore, I can present only a fragment of an analysis.

Readers who are familiar with the technique of analysis as it was expounded in the *Studies on Hysteria* [Breuer & Freud, 1895*d*; *RSE*, **2**] will perhaps be surprised that it should not have been possible in three months to find a complete solution at least for those of the symptoms which were taken in hand. This will become intelligible when I explain that since the date of the *Studies* psychoanalytic technique has been completely revolutionized. At that time the work of analysis started out from the symptoms, and aimed at clearing them up one after the other. Since then I have abandoned that technique, because I found it totally inadequate for dealing with the finer structure of a neurosis. I now let the patient himself choose the subject of the day's work, and in that way I start out from whatever surface his unconscious happens to be presenting to his notice at the moment. But on this plan everything that has to do with the

1 [For a later assessment of the part played by dream interpretation in analytic procedure, see Freud's paper devoted to that subject (1911*e*), *RSE*, **12**, 83 ff.]

clearing up of a particular symptom emerges piecemeal, woven into various contexts, and distributed over widely separated periods of time. In spite of this apparent disadvantage, the new technique is far superior to the old, and indeed there can be no doubt that it is the only possible one.

In face of the incompleteness of my analytic results, I had no choice but to follow the example of those discoverers whose good fortune it is to bring to the light of day after their long burial the priceless though mutilated relics of antiquity. I have restored what is missing, taking the best models known to me from other analyses; but, like a conscientious archaeologist, I have not omitted to mention in each case where the authentic parts end and my constructions begin.

There is another kind of incompleteness which I myself have intentionally introduced. I have as a rule not reproduced the process of interpretation [*Deutungsarbeit*] to which the patient's associations [*Einfällen*][T] and communications had to be subjected, but only the results of
[13] that process. Apart from the dreams, therefore, the technique of the analytic work has been revealed in only a very few places. My object in this case history was to demonstrate the intimate structure [*Aufbau*] of a neurotic disorder and the determination of its symptoms; and it would have led to nothing but hopeless confusion if I had tried to complete the other task at the same time. Before the technical rules, most of which have been arrived at empirically, could be properly laid down, it would be necessary to collect material from the histories of a large number of treatments. Nevertheless, the degree of shortening produced by the omission of the technique is not to be exaggerated in this particular case. Precisely that portion of the technical work which is the most difficult never came into question with the patient; for the factor of 'transference' ['*Übertragung*'][T], which is considered at the end of the case history [p. 102 ff. below], did not come up for discussion during the short treatment.

For a third kind of incompleteness in this report neither the patient nor the author is responsible. It is, on the contrary, obvious that a single case history, even if it were complete and open to no doubt, cannot provide an answer to *all* the questions arising out of the problem of hysteria. It cannot give an insight into all the types of this disorder, into all the forms of internal structure of the neurosis, into all the possible kinds of relation between the mental and the somatic which are to be found in hysteria. It is not fair to expect from a single case more than it can offer. And anyone who has hitherto been unwilling to believe that a psychosexual aetiology holds good generally and without exception for hysteria

is scarcely likely to be convinced of the fact by taking stock of a single case history. He would do better to suspend his judgement until his own work has earned him the right to a conviction.[1]

1 [*Footnote added* 1923:] The treatment described in this paper was broken off on December 31, 1899. [This should be '1900'. See p. 5 above.] My account of it was written during the two weeks immediately following, but was not published until 1905. [The Fliess correspondence shows that the account was completed on January 24, 1901.] It is not to be expected that after more than twenty years of uninterrupted work I should see nothing to alter in my view of such a case and in my presentment of it; but it would obviously be absurd to bring the case history 'up to date' by means of emendations and additions, and to adapt it to the present state of our knowledge.[2] In all essentials, therefore, I have left it as it was, and in the text I have merely corrected a few oversights and inaccuracies to which my excellent English translators, Mr and Mrs James Strachey, have directed my attention. Such critical remarks as I have thought it permissible to add I have [14]
incorporated in these additional notes: so that the reader will be justified in assuming that I still hold to the opinions expressed in the text unless he finds them contradicted in the footnotes. The problem of medical discretion which I have discussed in this Preface does not touch the remaining case histories contained in this volume [see below]; for three of them were published with the express assent of the patients (or rather, as regards Little Hans, with that of his father), while in the fourth case (that of Schreber) the subject of the analysis was not actually a person but a book produced by him. In Dora's case the secret was kept until this year. I had long been out of touch with her, but a short while ago I heard that she had recently fallen ill again from other causes, and had confided to her physician that she had been analysed by me when she was a girl. This disclosure made it easy for my well-informed colleague to recognize her as the Dora of 1899. [This, again, should be '1900'.] No fair judge of analytic therapy will make it a reproach that the three months' treatment she received at that time effected no more than the relief[T] of her current conflict and was unable to give her protection against subsequent illnesses. – [This footnote first appeared in the eighth volume of Freud's *Gesammelte Schriften* (1924), and, in English, in the third volume of his *Collected Papers* (1925). Each of these volumes contained his five longer case histories – that is, besides the present one, the cases (referred to in this footnote) of 'Little Hans' (1909*b*), *RSE*, **10**, 5 ff., the 'Rat Man' (1909*d*), ibid., **10**, 119 ff., Schreber (1911*c*), ibid., **12**, 9 ff., and the 'Wolf Man' (1918*b*), ibid., **17**, 7 ff. On the subject of 'Dora's' later history, see the paper by Felix Deutsch (1957) – the 'well-informed colleague' mentioned above.]

2 [The last clause (see footnote above) was inadvertently omitted in Strachey's *SE* translation.]

I
THE CLINICAL PICTURE

In my *Interpretation of Dreams*, published in 1900, I showed that dreams [15]
in general can be interpreted, and that after the work of interpretation
has been completed they can be replaced with perfectly correctly con-
structed thoughts which can be assigned a recognizable position in the
chain of mental events. I wish to give an example in the following pages
of the only practical application of which the art of interpreting dreams
seems to admit. I have already mentioned in my book[1] how it was that I
came upon the problem of dreams. The problem crossed my path as
I was endeavouring to cure psychoneuroses by means of a particular
psychotherapeutic method. For, among their other mental experiences
[*Vorfällen aus ihrem Seelenleben*][T], my patients told me their dreams, *Seele*
and these dreams seemed to call for insertion in the long thread of
connections which spun itself out between a symptom of the disease and
a pathogenic idea. At that time I learnt how to translate the language of
dreams into the forms of expression of our own thought language, which
can be understood without further help. And I may add that this know-
ledge is essential for the psychoanalyst; for the dream is one of the roads
along which consciousness can be reached by the psychical material
which, on account of the opposition aroused by its content, has been cut
off from consciousness and repressed [*verdrängt*][T], and has thus become *Verdrängung*
pathogenic. The dream, in short, is one of the *detours by which repres-
sion can be evaded*; it is one of the principal means employed by what
is known as the indirect method of representation in the mind. The
following fragment from the history of the treatment of a hysterical girl
is intended to show the way in which the interpretation of dreams plays
a part in the work of analysis. It will at the same time give me a first
opportunity of publishing at sufficient length to prevent further
misunderstanding some of my views upon the psychical processes of
hysteria and upon its organic determinants. I need no longer apologize
on the score of length, since it is now agreed that the exacting demands

1 *The Interpretation of Dreams*, Chapter II [(1900*a*), *RSE*, **4**, 89 ff.].

[16] which hysteria makes upon physician and investigator can be met only by the most sympathetic spirit of enquiry and not by an attitude of superiority and contempt. For,

> Nicht Kunst und Wissenschaft allein,
> Geduld will bei dem Werke sein![1]

If I were to begin by giving a full and consistent case history, it would place the reader in a very different situation from that of the medical observer. The reports of the patient's relatives – in the present case I was given one by the eighteen-year-old girl's father – usually afford a very indistinct picture of the course of the illness. I begin the treatment, indeed, by asking the patient to give me the whole story of his life and illness, but even so the information I receive is never enough to let me see my way about the case. This first account may be compared to an unnavigable river whose stream is at one moment choked by masses of rock and at another divided and lost among shallows and sandbanks. I cannot help wondering how it is that the authorities can produce such smooth and precise histories in cases of hysteria. As a matter of fact the patients are incapable of giving such reports about themselves. They can, indeed, give the physician plenty of coherent information about this or that period of their lives; but it is sure to be followed by another period as to which their communications run dry, leaving gaps unfilled, and riddles unanswered; and then again will come yet another period which will remain totally obscure and unilluminated by even a single piece of serviceable information. The connections – even the ostensible ones – are for the most part incoherent, and the sequence of different events is uncertain. Even during the course of their story patients will repeatedly correct a particular or a date, and then perhaps, after wavering for some time, return to their first version. The patients' inability to give an ordered history of their life insofar as it coincides with the history of their illness is not merely characteristic of the neurosis.[2] It also possesses

1 [Not Art and Science serve, alone;
Patience must in the work be shown.
Goethe, *Faust*, Part I (Scene 6).
(Bayard Taylor's translation.)]

2 Another physician once sent his sister to me for psychotherapeutic treatment, telling me that she had for years been treated without success for hysteria (pains and defective gait). The short account which he gave me seemed quite consistent with the diagnosis. In my first hour with the patient I got her to tell me her history herself. When the story came out perfectly clearly and connectedly in spite of the remarkable events it dealt with, I told myself that the case could not be one of hysteria, and immediately instituted a careful physical examination. This led to the diagnosis of a not very advanced stage of tabes, which was later on treated with Hg injections (Ol. cinereum) by Professor Lang with markedly beneficial results.

great theoretical significance. For this inability has the following [17]
grounds. In the first place, patients consciously and intentionally keep back part of what they ought to tell – things that are perfectly well known to them – because they have not got over their feelings [*Motiven*][T] of timidity and shame (or discretion, where what they say concerns other people); this is the share taken by *conscious* disingenuousness. In the second place, part of the anamnestic knowledge, which the patients have at their disposal at other times, disappears while they are actually telling their story, but without their making any deliberate reservations: the share taken by *unconscious* disingenuousness. In the third place, there are invariably true amnesias – gaps in the memory into which not only old recollections but even quite recent ones have fallen – and paramnesias, formed secondarily so as to fill in those gaps.[1] When the events themselves have been kept in mind, the purpose underlying the amnesias can be fulfilled just as surely by destroying a connection, and a connection is most surely broken by altering the chronological order of events. The latter always proves to be the most vulnerable element in the store of memory and the one which is most easily subject to repression. Again, we meet with many recollections that are in what might be described as the first stage of repression, and these we find surrounded with doubts. At a later period the doubts would be replaced by a loss [*Vergessen*][T] or a falsification of memory [*Fehlerinnern*].[2]

That this state of affairs should exist in regard to the memories [18]
relating to the history of the illness is *a necessary correlate of the symptoms and one which is theoretically requisite*. In the further course of the treatment the patient supplies the facts which, though he had known them all along, had been kept back by him or had not occurred to his mind [*eingefallen*]. The paramnesias prove untenable, and the gaps in his memory are filled in. It is only towards the end of the treatment that we have before us an intelligible, consistent and unbroken case history. Whereas the practical aim of the treatment is to remove all possible symptoms and to replace them with conscious thoughts, we may regard it as a second and theoretical aim to repair all the damages to the patient's

1 Amnesias and paramnesias stand in a complementary relation to each other. When there are large gaps in the memory there will be few mistakes in it. And conversely, paramnesias can at first glance completely conceal the presence of amnesias.

2 If a patient exhibits doubts in the course of his narrative, an empirical rule teaches us to disregard such expressions of his judgement entirely. If the narrative wavers between two versions, we should incline to regard the first one as correct and the second as a product of repression. [Cf. a discussion of doubt in connection with dreams in *The Interpretation of Dreams* (1900*a*), Chapter VII, Section A; *RSE*, **5**, 461 f. For the very different mechanism of doubt in obsessional neurosis, see the case history of the 'Rat Man' (1909*d*), Part II, Section C; ibid., **10**, 179.]

memory. These two aims are coincident. When one is reached, so is the other; and the same path leads to them both.

It follows from the nature of the facts which form the material of psychoanalysis that we are obliged to pay as much attention in our case histories to the purely human and social circumstances of our patients as to the somatic data and the symptoms of the disorder. Above all, our interest will be directed towards their family circumstances – and not only, as will be seen later, for the purpose of enquiring into their heredity.

The family circle of the eighteen-year-old girl who is the subject of this paper included, besides herself, her two parents and a brother who was one and a half years her senior. Her father was the dominating figure in this circle, owing to his intelligence and his character as much as to the circumstances of his life. It was those circumstances which provided the framework for the history of the patient's childhood and illness. At the time at which I began the girl's treatment her father was in his late forties, a man of rather unusual activity and talents, a large manufacturer in very comfortable circumstances. His daughter was most tenderly attached to him, and for that reason her critical powers, which developed early, took all the more offence at many of his actions and peculiarities.

[19] Her affection for him was still further increased by the many severe illnesses which he had been through since her sixth year. At that time he had fallen ill with tuberculosis and the family had consequently moved to a small town in a good climate, situated in one of our southern provinces.[1] There his lung trouble rapidly improved; but, on account of the precautions which were still considered necessary, both parents and children continued for the next ten years or so to reside chiefly in this spot, which I shall call B——. When her father's health was good, he used at times to be away, on visits to his factories. During the hottest part of the summer the family used to move to a health resort in the hills.

When the girl was about ten years old, her father had to go through a course of treatment in a darkened room on account of a detached retina. As a result of this misfortune his vision was permanently impaired. His gravest illness occurred some two years later. It took the form of a confusional attack, followed by symptoms of paralysis and slight mental disturbances. A friend of his (who plays a part in the story with which we shall be concerned later on [see p. 27 *n.* 3 below]) persuaded him, while his condition had scarcely improved, to travel to Vienna with his

1 [This was Merano, a Tyrolean resort town 250 miles southwest of Vienna.]

physician and come to me for advice. I hesitated for some time as to whether I ought not to regard the case as one of taboparalysis, but I finally decided upon a diagnosis of a diffuse vascular affection; and since the patient admitted having had a specific infection before his marriage, I prescribed an energetic course of anti-luetic treatment, as a result of which all the remaining disturbances passed off. It is no doubt owing to this fortunate intervention of mine that four years later he brought his daughter, who had meanwhile grown unmistakably neurotic, and introduced her to me, and that after another two years he handed her over to me for psychotherapeutic treatment.

I had in the meantime also made the acquaintance in Vienna of a sister of his, who was a little older than himself.[1] She gave clear evidence of a severe form of psychoneurosis without any characteristically hysterical symptoms. After a life which had been weighed down by an unhappy marriage, she died of a marasmus which made rapid advances and the symptoms of which were, as a matter of fact, never fully cleared up. An elder brother of the girl's father, whom I once happened to meet, was a hypochondriacal bachelor.

The sympathies of the girl herself, who, as I have said, became my [20]
patient at the age of eighteen,[2] had always been with the father's side of the family, and ever since she had fallen ill she had taken as her model the aunt who has just been mentioned. There could be no doubt, too, that it was from her father's family that she had derived not only her natural gifts and her intellectual precocity but also the predisposition to her illness. I never made her mother's acquaintance. From the accounts given me by the girl and her father I was led to imagine her as an uncultivated woman and above all as a foolish one, who had concentrated all her interests upon domestic affairs, especially since her husband's illness and the estrangement to which it led. She presented the picture, in fact, of what might be called the 'housewife's psychosis'. She had no understanding of her children's more active interests, and was occupied all day long in cleaning the house with its furniture and utensils and in keeping them clean – to such an extent as to make it almost impossible to use or enjoy them. This condition, traces of which are to be found often enough in normal housewives, inevitably reminds one of forms of obsessional washing and other kinds of obsessional cleanliness. But such women (and this applied to the patient's mother) are entirely without insight into their illness, so that one essential characteristic of an 'obsessional

1 [Actually she was a little younger than him.]

2 [For the first weeks of her treatment, 'Dora' was still seventeen.]

neurosis' [*Zwangsneurose*'][T] is lacking. The relations between the girl and her mother had been unfriendly for years. The daughter looked down on her mother and used to criticize her mercilessly, and she had withdrawn completely from her influence.[1]

[21] During the girl's earlier years, her only brother (her elder by a year and a half) had been the model which her ambitions had striven to follow. But in the last few years the relations between the brother and sister had grown more distant. The young man used to try so far as he could to keep out of the family disputes; but when he was obliged to take sides he would support his mother. So that the usual sexual attraction had drawn together the father and daughter on the one side and the mother and son on the other.

The patient, to whom I shall in future give the name of 'Dora',[2] had even at the age of eight begun to develop neurotic symptoms. She became subject at that time to chronic dyspnoea with occasional accesses in which the symptom was very much aggravated. The first onset occurred after a short expedition in the mountains and was accordingly put down to overexertion. In the course of six months, during which she was made to rest and was carefully looked after, this condition gradually passed off. The family doctor seems to have had not a moment's hesitation in diagnosing the disorder as purely nervous and in excluding any organic cause for the dyspnoea; but he evidently considered this diagnosis compatible with the aetiology of overexertion.[3]

1 I do not, it is true, adopt the position that heredity is the only aetiological factor in hysteria. But, on the other hand – and I say this with particular reference to some of my earlier publications, e.g. 'Heredity and the Aetiology of the Neuroses' (1896*a*) [*RSE*, **3**, 153 ff.], in which I combated that view – I do not wish to give an impression of underestimating the importance of heredity in the aetiology of hysteria or of asserting that it can be dispensed with. In the case of the present patient the information I have given about her father and his brother and sister indicates a sufficiently heavy taint; and, indeed, if the view is taken that pathological conditions such as her mother's must also imply a hereditary predisposition, the patient's heredity may be regarded as a convergent one. To my mind, however, there is another factor which is of more significance in the girl's hereditary or, properly speaking, constitutional predisposition. I have mentioned that her father had contracted syphilis before his marriage. Now a *strikingly high* percentage of the patients whom I have treated psychoanalytically come of fathers who have suffered from tabes or general paralysis. In consequence of the novelty of my therapeutic method, I see only the *severest* cases, which have already been under treatment for years without any success. In accordance with the Erb–Fournier theory, tabes or general paralysis in the male parent may be regarded as evidence of an earlier luetic infection; and indeed I was able to obtain direct confirmation of such an infection in a number of cases. In the most recent discussion on the offspring of syphilitic parents (Thirteenth International Medical Congress, held in Paris, August 2–9, 1900: papers by Finger, Tarnowsky, Jullien, etc.), I find no mention of the conclusion to which I have been driven by my experience as a neuropathologist – namely, that syphilis in the male parent is a very relevant factor in the aetiology of the neuropathic constitution of children.

2 [The determinants of Freud's choice of this pseudonym were discussed by him in Chapter XII, Example A (1), of his *Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 207 f.]

3 The probable precipitating cause of this first illness will be discussed later on [p. 71 below].

The little girl went through the usual infectious diseases of childhood without suffering any lasting damage. As she herself told me – and her words were intended to convey a deeper meaning [see p. 72 *n*. 3 below] – her brother was as a rule the first to start the illness and used to have it very slightly, and she would then follow suit with a severe form of it. When she was about twelve she began to suffer from unilateral headaches in the nature of a migraine, and from attacks of nervous coughing. At first these two symptoms always appeared together, but they became separated later on and ran different courses. The migraine grew rarer, and by the time she was sixteen she had quite got over it. But attacks of *tussis nervosa*, which had no doubt been started by a common catarrh, continued to occur over the whole period. When, at the age of eighteen, she came to me for treatment, she was again coughing in a characteristic manner. The number of these attacks could not be determined; but they lasted from three to five weeks, and on one occasion for several months. The most troublesome symptom during the first half of an attack of this kind, at all events in the last few years, used to be a complete loss of voice. The diagnosis that this was once more a nervous complaint had been established long since; but the various methods of treatment which are usual, including hydrotherapy and the local application of electricity, had produced no result. It was in such circumstances as these that the child had developed into a mature young woman of very independent judgement, who had grown accustomed to laugh at the efforts of doctors, and in the end to renounce their help entirely. Moreover, she had always been against calling in medical advice, though she had no personal objection to her family doctor. Every proposal to consult a new physician aroused her resistance, and it was only her father's authority[t] which induced her to come to me at all. [22]

I first saw her when she was sixteen, in the early summer.[1] She was suffering from a cough and from hoarseness, and even at that time I proposed giving her psychological treatment. My proposal was not adopted, since the attack in question, like the others, passed off spontaneously, though it had lasted unusually long. During the next winter she came and stayed in Vienna with her uncle and his daughters after the death of the aunt of whom she had been so fond.[2] There she fell ill of a feverish disorder which was diagnosed at the time as appendicitis.[3] In the

1 ['Dora' was actually fifteen at the time of this consultation. She turned sixteen on November 1, 1898. The lake incident described below (p. 24), which occurred shortly after the consultation with Freud, took place on June 30.]

2 [Actually this aunt died in April of the following year, after 'Dora' went to Vienna.]

3 On this point see the analysis of the second dream [p. 90 below].

following autumn, since her father's health seemed to justify the step,
[23] the family left the health resort of B—— for good and all. They first moved to the town where her father's factory was situated,[1] and then, scarcely a year later, settled permanently in Vienna.

Dora was by that time in the first bloom of youth – a girl of intelligent and engaging looks. But she was a source of heavy trials for her parents. Low spirits and an alteration in her character had now become the main features of her illness. She was clearly satisfied neither with herself nor with her family; her attitude towards her father was unfriendly, and she was on very bad terms with her mother, who was bent upon drawing her into taking a share in the work of the house. She tried to avoid social intercourse, and employed herself – so far as she was allowed to by the fatigue and lack of concentration of which she complained – with attending lectures for ladies and with carrying on more or less serious [*ernstere*] studies. One day her parents were thrown into a state of great alarm by finding on the girl's writing desk, or inside it, a letter in which she took leave of them because, as she said, she could no longer endure her life.[2] Her father, indeed, being a man of some perspicacity, guessed that the girl had no serious suicidal intentions. But he was nonetheless very much shaken; and when one day, after a slight passage of words between him and his daughter, she had a first attack of loss of consciousness[3] – an event which was subsequently covered by an amnesia – it was determined, in spite of her reluctance, that she should come to me for treatment.

No doubt this case history, as I have so far outlined it, does not upon the whole seem worth recording. It is merely a case of '*petite hystérie*' with
[24] the commonest of all somatic and mental symptoms: dyspnoea, *tussis nervosa*, aphonia and possibly migraines, together with depression, hysterical unsociability and a *taedium vitae* which was probably not entirely genuine. More interesting cases of hysteria have no doubt been published, and they have very often been more carefully described; for

1 [This was the Bohemian town of Reichenberg (now Liberec) 200 miles northwest of Vienna.]

2 As I have already explained, the treatment of the case, and consequently my insight into the complex of events composing it, remained fragmentary. There are therefore many questions to which I have no solution to offer, or in which I can only rely upon hints and conjectures. This affair of the letter came up in the course of one of our sessions [p. 87 f. below], and the girl showed signs of astonishment. 'How on earth', she asked, 'did they find the letter? It was shut up in my desk.' But since she knew that her parents had read this draft of a farewell letter, I conclude that she had herself arranged for it to fall into their hands.

3 The attack was, I believe, accompanied by convulsions and delirious states. But since this event was not reached by the analysis either, I have no trustworthy recollections on the subject to fall back upon.

nothing will be found in the following pages on the subject of stigmata of cutaneous sensibility, limitation of the visual field, or similar matters. I may venture to remark, however, that all such collections of the strange and wonderful phenomena of hysteria have but slightly advanced our knowledge of a disease which still remains as great a puzzle as ever. What is wanted is precisely an elucidation of the *commonest* cases and of their most frequent and typical symptoms. I should have been very well satisfied if the circumstances had allowed me to give a complete elucidation of this case of *petite hystérie*. And my experiences with other patients leave me in no doubt that my analytic method would have enabled me to do so.

In 1896, shortly after the appearance of my *Studies on Hysteria* (written in conjunction with Dr J. Breuer, 1895*d*), I asked an eminent fellow specialist [*Fachgenossen*] for his opinion on the psychological theory of hysteria put forward in that work. He bluntly replied that he considered it an unjustifiable generalization of conclusions which might hold good for a few cases. Since then I have seen an abundance of cases of hysteria, and I have been occupied with each case for a number of days, weeks or years. In not a single one of them have I failed to discover the psychological determinants which were postulated in the *Studies*, namely, a psychical trauma, a conflict of affects, and – an additional factor which I brought forward in later publications – a disturbance in the sphere of sexuality. It is of course not to be expected that the patient will come to meet the physician halfway with material which has become pathogenic for the very reason of its efforts to lie concealed; nor must the enquirer rest content with the first 'No' that crosses his path.[1]

In Dora's case, thanks to her father's shrewdness which I have remarked upon more than once already, there was no need for me to look about [25] for the points of contact between the circumstances of the patient's life

1 Here is an instance of this. Another physician in Vienna, whose conviction of the unimportance of sexual factors in hysteria has probably been very much strengthened by such experiences as this, was consulted in the case of a fourteen-year-old girl who suffered from dangerous hysterical vomiting. He made up his mind to ask her the painful question whether by any chance she had ever had a love affair with a man. 'No!' answered the child, no doubt with well-affected astonishment; and then repeated to her mother in her irreverent way: 'Only fancy! the old stupid asked me if I was in love!' She afterwards came to me for treatment, and proved – though not during our very first conversation, to be sure – to have been a masturbator for many years, with a considerable leucorrhoeal discharge (which had a close bearing on her vomiting). She had finally broken herself of the habit, but was tormented in her abstinence by the most acute sense of guilt, so that she looked upon every misfortune that befell her family as a divine punishment for her transgression. Besides this, she was under the influence of the romance of an unmarried aunt, whose pregnancy (a second determinant for her vomiting) was supposed to have been happily hidden from her. The girl was looked upon as a 'mere child', but she turned out to be initiated into all the essentials of sexual relations.

and her illness, at all events in its most recent form. Her father told me that he and his family while they were at B—— had formed an intimate friendship with a married couple who had been settled there for several years. Frau K. had nursed him during his long illness, and had in that way, he said, earned a title to his undying gratitude. Herr K. had always been most kind to Dora. He had gone for walks with her when he was there, and had made her small presents; but no-one had thought any harm of that. Dora had taken the greatest care of the K.s' two little children, and been almost a mother to them. When Dora and her father had come to see me two years before in the summer, they had been just on their way to stop with Herr and Frau K., who were spending the summer on one of our lakes in the Alps.[1] Dora was to have spent several weeks at the K.s', while her father had intended to return home after a few days. During that time Herr K. had been staying there as well. As her father was preparing for his departure the girl had suddenly declared with the greatest determination that she was going with him, and she had in fact put her decision into effect. It was not until some days later that she had thrown any light upon her strange behaviour. She had then told her mother – intending that what she said should be passed on to her father – that Herr K. had had the audacity to make her a romantic proposal[t] while they were on a walk after a trip upon the lake. Herr K. had been called to account by her father and uncle on the next occasion of their
[26] meeting, but he had denied in the most emphatic terms having on his side made any advances which could have been open to such a construction. He had then proceeded to throw suspicion upon the girl, saying that he had heard from Frau K. that she took no interest in anything but sexual matters, and that she used to read Mantegazza's *Physiology of Love* and books of that sort in their house on the lake. It was most likely, he had added, that she had been overexcited by such reading and had merely 'fancied' the whole scene she had described.

'I have no doubt', continued her father, 'that this incident is responsible for Dora's depression and irritability and suicidal ideas. She keeps pressing me to break off relations with Herr K. and more particularly with Frau K., whom she used positively to worship formerly. But that I cannot do. For, to begin with, I myself believe that Dora's tale of the man's immoral suggestions [*Zumutung*][t] is a phantasy [*Phantasie*][T] that has forced its way into her mind; and besides, I am bound to Frau K. by ties of honourable friendship and I do not wish to cause her pain. The poor woman is most unhappy with her husband, of whom, by

1 [Possibly Lago di Garda, a favourite summer retreat of the residents of Merano.]

the by, I have no very high opinion. She herself has suffered a great deal with her nerves, and I am her only support. With my state of health I need scarcely assure you that there is nothing wrong in our relations. We are just two poor wretches who give one another what comfort we can by an exchange of friendly sympathy. You know already that I get nothing out of my own wife. But Dora, who inherits my obstinacy, cannot be moved from her hatred of the K.s. She had her last attack after a conversation in which she had again pressed me to break with them. Please try to bring her to reason.'

Her father's words did not always quite tally with this pronouncement; for on other occasions he tried to put the chief blame for Dora's impossible behaviour on her mother – whose peculiarities made the house unbearable for everyone. But I had resolved from the first to suspend my judgement of the true state of affairs till I had heard the other side as well.

The experience with Herr K. – his propositioning[t] her and the insult to her honour which was involved – seems to provide in Dora's case the psychical trauma which Breuer and I declared long ago[1] to be the indispensable prerequisite for the production of a hysterical disorder. [27]
But this new case also presents all the difficulties which have since led me to go beyond that theory,[2] besides an additional difficulty of a special kind. For, as so often happens in histories of cases of hysteria, the trauma that we know of as having occurred in the patient's past life is insufficient to explain or to determine the *particular character* of the symptoms; we should understand just as much or just as little of the whole business if the result of the trauma had been symptoms quite other than *tussis nervosa*, aphonia, depression and *taedium vitae*. But there is the further consideration that some of these symptoms (the cough and the loss of

1 [In their 'Preliminary Communication' (Breuer & Freud, 1893*a*), *RSE*, **2**, 3 ff.]

2 I have gone beyond that theory, but I have not abandoned it; that is to say, I do not today consider the theory incorrect, but incomplete. All that I have abandoned is the emphasis laid upon the so-called 'hypnoid state', which was supposed to be occasioned in the patient by the trauma, and to be the foundation for all the psychologically abnormal events which followed. If, where a piece of joint work is in question, it is legitimate to make a subsequent [*nachträglich*][T] division of property, I should like to take this opportunity of stating that the hypothesis of 'hypnoid states' – which many reviewers were inclined to regard as the central portion of our work – sprang entirely from the initiative of Breuer. I regard the use of such a term as superfluous and misleading, because it interrupts the continuity[t] of the problem as to the nature of the psychological process accompanying the formation of hysterical symptoms. – ['Hypnoid states' were referred to in the 'Preliminary Communication', but they were discussed at greater length by Breuer in his contribution to the *Studies on Hysteria* (1895*d*), Chapter III, Section 4; *RSE*, **2**, 191 ff. Freud enters into his theoretical disagreements with Breuer in more detail in the first section of his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 8.]

voice) had been produced by the patient years before the time of the trauma, and that their earliest appearances belong to her childhood, since they occurred in her eighth year. If, therefore, the trauma theory is not to be abandoned, we must go back to her childhood and look about there for any influences or impressions which might have had an effect analogous to that of a trauma. Moreover, it deserves to be remarked that in the investigation even of cases in which the first symptoms had not already set in in childhood I have been driven to trace back the patients' life history to their earliest years.[1]

When the first difficulties of the treatment had been overcome, Dora told me of an earlier episode with Herr K., which was even better
[28] calculated to act as a sexual trauma. She was fourteen[2] years old at the time. Herr K. had made an arrangement with her and his wife that they [*die Damen*][t] should meet him one afternoon at his place of business in the principal square of B—— so as to have a view of a church festival. He persuaded his wife, however, to stay at home, and sent away his clerks, so that he was alone when the girl arrived. When the time for the procession approached, he asked the girl to wait for him at the door which opened on to the staircase leading to the upper storey, while he pulled down the outside shutters. He then came back, and, instead of going out by the open door, suddenly clasped the girl to him and pressed a kiss upon her lips. This was surely just the situation to call up a distinct feeling of sexual excitement in a girl of fourteen who had never before been approached [*unberührten*][t]. But Dora had at that moment a violent feeling of disgust, tore herself free from the man, and hurried past him to the staircase and from there to the street door. She nevertheless continued to meet Herr K. Neither of them ever mentioned the little scene; and according to her account Dora kept it a secret till her confession during the treatment. For some time afterwards, however, she avoided being alone with Herr K. The K.s had just made plans for an expedition which was to last for some days and on which Dora was to have accompanied them. After the scene of the kiss she refused to join the party, without giving any reason.[3]

In this scene – second in order of mention, but first in order of time – the behaviour of this child of fourteen was already entirely and completely hysterical. I should without question consider a person

1 Cf. my paper on 'The Aetiology of Hysteria' (1896*c* [*RSE*, **3**, 208–9]).

2 [It appears that 'Dora' was actually thirteen and a half years old at the time of this episode.]

3 [In all the editions before 1924 the following footnote appeared at this point: 'A contributory reason for this refusal will be found on p. (24).' (This would correspond to pp. 28–9 in the present edition.) As no such reference could be traced either there or elsewhere, the footnote was omitted, on Freud's instructions, in the English translation of 1925, and in all the later German editions.]

hysterical in whom an occasion for sexual excitement elicited feelings that were preponderantly or exclusively unpleasurable [*Unlustgefühle*][T]; *Lust*
and I should do so whether or not the person were capable of producing somatic symptoms. The elucidation of the mechanism of this *reversal of affect* is one of the most important and at the same time one of the most difficult problems in the psychology of the neuroses. In my own judgement I am still some way from having achieved this end; and I may add [29]
that within the limits of the present paper I shall be able to bring forward only a part of such knowledge on the subject as I do possess.[1]

In order to particularize Dora's case it is not enough merely to draw attention to the reversal of affect; there has also been a *displacement* [*Verschiebung*][T] of sensation. Instead of the genital sensation which would certainly have been felt by a healthy girl in such circumstances,[2] Dora was overcome by the unpleasurable feeling which is proper to the tract of mucous membrane at the entrance to the alimentary canal – that is, by disgust. The stimulation of her lips by the kiss was no doubt of importance in localizing the feeling at that particular place; but I think I can also recognize another factor in operation.[3]

The disgust which Dora felt on that occasion did not become a permanent symptom, and even at the time of the treatment it was only, as it were, potentially present. She was a poor eater and confessed to some disinclination for food. On the other hand, the scene had left another consequence behind it in the shape of a sensory hallucination which occurred from time to time and even made its appearance while she was telling me her story. She declared that she could still feel upon the upper part of her body the pressure of Herr K.'s embrace. In accordance with certain rules of symptom-formation which I have come to know, and at the same time taking into account certain other of the patient's peculiarities, which were otherwise inexplicable – such as her unwillingness to walk past any man whom she saw engaged in eager or affectionate conversation with a lady – I have formed in my own mind the following

1 [This is one of the problems which recurs constantly throughout Freud's writings. He touches upon it, for instance, in considering anxiety dreams in Chapter VII, Section D, of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 521, in the opening paragraphs of his paper on 'Repression' (1915*d*), ibid., **14**, at the end of the first chapter of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, and again at the beginning of the second chapter of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, where a fresh solution is proposed. See also Letter 75 to Fliess (Freud, 1950*a*), ibid., **1**, 296–7.]

2 Our appreciation of these circumstances will be facilitated when more light has been thrown upon them. [Cf. p. 74 f. below.]

3 The causes of Dora's disgust at the kiss were certainly not adventitious, for in that case she could not have failed to remember and mention them. I happen to know Herr K., for he was the same person who had visited me with the patient's father [p. 18 above], and he was still quite young and of prepossessing appearance.

[30] reconstruction of the scene. I believe that during the man's passionate embrace she felt not merely his kiss upon her lips but also the pressure of his erect member against her body. This perception was revolting to her; it was dismissed from her memory, repressed, and replaced with the innocent sensation of pressure upon her thorax, which in turn derived an excessive intensity from its repressed source. Once more, therefore, we find a displacement from the lower part of the body to the upper.[1] On the other hand, the compulsive piece of behaviour which I have mentioned was formed as though it were derived from the undistorted recollection of the scene: she did not like walking past any man whom she thought was in a state of sexual excitement, because she wanted to avoid seeing for a second time the somatic sign which accompanies it.

It is worth remarking that we have here three symptoms – the disgust, the sensation of pressure on the upper part of the body, and the avoidance of men engaged in affectionate conversation – all of them derived from a single experience, and that it is only by taking into account the interrelation of these three phenomena that we can understand the way in which the formation of the symptoms came about. The disgust is the symptom of repression in the erotogenic oral zone,[2] which, as we shall hear [p. 46 f. below], had been overindulged in Dora's infancy by the habit of sensual sucking. The pressure of the erect member probably led to an analogous change in the corresponding female organ, the clitoris; and the excitation of this second erotogenic zone was referred by a process of displacement to the simultaneous pressure against the thorax
Fixierung and became fixed [*fixiert*][T] there. Her avoidance of men[t] who might possibly be in a state of sexual excitement follows the mechanism of a
[31] phobia, its purpose being to safeguard her against any revival of the repressed perception.

In order to show that such a supplement to the story was possible, I questioned the patient very cautiously as to whether she knew anything of the physical signs of excitement in a man's body. Her answer, as touching the present, was 'Yes', but, as touching the time of the episode, 'I think not'. From the very beginning I took the greatest pains with this

1 The occurrence of displacements of this kind has not been assumed for the purpose of this single explanation; the assumption has proved indispensable for the explanation of a large class of symptoms. [Cf. below, p. 73 *n*. 1.] Since treating Dora I have come across another instance of an embrace (this time without a kiss) causing a fright. It was a case of a young woman who had previously been devotedly fond of the man she was engaged to, but had suddenly begun to feel a coldness towards him, accompanied by severe depression, and on that account came to me for treatment. There was no difficulty in tracing the fright back to an erection on the man's part, which she had perceived but had dismissed from her consciousness.

2 [See below, p. 47.]

patient not to introduce her to any fresh facts in the region of sexual knowledge; and I did this, not from any conscientious motives, but because I was anxious to subject my assumptions to a rigorous test in this case. Accordingly, I did not call a thing by its name until her allusions to it had become so unambiguous that there seemed very slight risk in translating them into direct speech. Her answer was always prompt and frank: she knew about it already. But the question of *where* her knowledge came from was a riddle which her memories were unable to solve. She had forgotten the source of all her information on this subject.[1]

If I may suppose that the scene of the kiss took place in this way, I can arrive at the following derivation for the feelings of disgust.[2] Such feelings seem originally to be a reaction to the smell (and afterwards also to the sight) of excrement. But the genitals can act as a reminder of the excretory functions; and this applies especially to the male member, for that organ performs the function of micturition as well as the sexual function. Indeed, the function of micturition is the earlier known of the two, and the *only* one known during the presexual period. Thus it happens that disgust becomes one of the means of affective expression in the sphere of sexual life. The Early Christian Father's '*inter urinas et faeces nascimur*' clings to sexual life and cannot be detached from it in spite of every effort at idealization. I should like, however, expressly to emphasize my opinion that the problem is not solved by the mere pointing out of this path of association. The fact that this association *can* be called up does not show that it actually *will* be called up. And indeed [32]
in normal circumstances it will not be. A knowledge of the paths does not render less necessary a knowledge of the forces which travel along them.[3]

1 See the second dream [pp. 88–9 below. – Cf. also pp. 33 *n*., 56 and 106 *n*.].

2 Here, as in all similar cases, the reader must be prepared to be met not with one but with several causes – by *overdetermination* [*Überdeterminierung*][T]. [Freud had mentioned this characteristic of hysterical symptoms in Section 3 of his chapter on the psychotherapy of hysteria in Breuer & Freud's *Studies on Hysteria* (1895*d*), *RSE*, **2**, 258. It was also discussed by Breuer (with an acknowledgement to Freud) in Section 3 of his theoretical contribution to the same work, ibid., **2**, 189, and again by Freud in 'The Aetiology of Hysteria' (1896*c*), ibid., **3**, 221.]

3 All these discussions contain much that is typical and valid for hysteria in general. The subject of erection solves some of the most interesting hysterical symptoms. The attention that women pay to the outlines of men's genitals as seen through their clothing becomes, when it has been repressed, a source of the very frequent cases of avoiding company and of dreading society. – It is scarcely possible to exaggerate the pathogenic significance of the comprehensive tie uniting the sexual and the excremental, a tie which is at the basis of a very large number of hysterical phobias. [This topic recurs very frequently in Freud's writings. It appears, for instance, as early as 1897 in Draft K in the Fliess correspondence (Freud, 1950*a*), and as late as 1930 in the long footnote at the end of Chapter IV of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 95–6 *n*. 3.]

I did not find it easy, however, to direct the patient's attention to her relations with Herr K. She declared that she had done with him. The uppermost layer of all her associations during the sessions, and everything of which she was easily conscious and of which she remembered having been conscious the day before, was always connected with her father. It was quite true that she could not forgive her father for continuing his relations with Herr K. and more particularly with Frau K. But she viewed those relations in a very different light from that in which her father wished them to appear. In her mind there was no doubt that what bound her father to this young and beautiful woman was a common love affair. Nothing that could help to confirm this view had escaped her perception, which in this connection was pitilessly sharp; *here there were no gaps to be found in her memory*. Their acquaintance with the K.s had begun before her father's serious illness; but it had not become intimate until the young woman had officially taken on the position of nurse during that illness, while Dora's mother had kept away from the sick-room. During the first summer holidays after his recovery things had happened which must have opened everyone's eyes to the true character of this 'friendship'. The two families had taken a suite of rooms in common at the hotel. One day Frau K. had announced that she could not keep the bedroom which she had up till then shared with one of her chil-
[33] dren. A few days later Dora's father had given up his bedroom, and they had both moved into new rooms – the end rooms, which were only separated by the passage, while the rooms they had given up had not offered any such security against interruption. Later on, whenever she had reproached her father about Frau K., he had been in the habit of saying that he could not understand her hostility and that, on the contrary, his children had every reason for being grateful to Frau K. Her mother, whom she had asked for an explanation of this mysterious remark, had told her that her father had been so unhappy at that time that he had made up his mind to go into the wood and kill himself, and that Frau K., suspecting as much, had gone after him and had persuaded him by her entreaties to preserve his life for the sake of his family. Of course, Dora went on, she herself did not believe this story; no doubt the two of them had been seen together in the wood, and her father had thereupon invented this fairy tale of his suicide so as to account for their rendezvous.[1]

When they had returned to B——, her father had visited Frau K. every day at definite hours, while her husband was at his business. Everybody

1 This is the point of connection with her own pretence at suicide [p. 22 above], which may thus be regarded as the expression of a longing for a love of the same kind.

had talked about it and had questioned her about it pointedly. Herr K. himself had often complained bitterly to her mother, though he had spared her herself any allusions to the subject – which she seemed to attribute to delicacy of feeling on his part. When they had all gone for walks together, her father and Frau K. had always known how to manage things so as to be alone with each other. There could be no doubt that she had taken money from him, for she spent more than she could possibly have afforded out of her own purse or her husband's. Dora added that her father had begun to make handsome presents to Frau K., and in order to make these less conspicuous had at the same time become especially liberal towards her mother and herself. And, while previously Frau K. had been an invalid and had even been obliged to spend months in a sanatorium for nervous disorders because she had been unable to walk, she had now become a healthy and lively woman.

Even after they had left B—— [for the manufacturing town], these relations, already of many years' standing, had been continued. From [34] time to time her father used to declare that he could not endure the rawness of the climate, and that he must do something for himself; he would begin to cough and complain, until suddenly he would start off to B——, and from there write the most cheerful letters home. All these illnesses had only been pretexts for seeing his friend again. Then one day it had been decided that they were to move to Vienna and Dora began to suspect a hidden connection. And sure enough, they had scarcely been three weeks in Vienna when she heard that the K.s had moved there as well. They were in Vienna, so she told me, at that very moment, and she frequently met her father with Frau K. in the street. She also met Herr K. very often, and he always used to turn round and look after her; and once when he had met her out by herself he had followed her for a long way, so as to make sure where she was going and whether she might not have a rendezvous.

On one occasion during the course of the treatment her father again felt worse, and went off to B—— for several weeks; and the sharp-sighted Dora had soon unearthed the fact that Frau K. had started off to the same place on a visit to her relatives there. It was at this time that Dora's criticisms of her father were the most frequent: he was insincere, he had a strain of falseness in his character, he only thought of his own enjoyment, and he had a gift for seeing things in the light which suited him best.

I could not in general dispute Dora's characterization of her father; and there was one particular respect in which it was easy to see that her

reproaches were justified. When she was feeling embittered she used to be overcome by the idea that she had been handed over to Herr K. as the price of his tolerating the relations between her father and his wife; and her rage at her father's making such a use of her was visible behind her affection for him. At other times she was quite well aware that she had been guilty of exaggeration in talking like this. The two men had of course never made a formal agreement in which she was treated as an object for barter; her father in particular would have been horrified at any such suggestion. But he was one of those men who know how to evade a dilemma by falsifying their judgement upon one of the conflicting alternatives. If it had been pointed out to him that there might be
[35] danger for a growing girl in the constant and unsupervised companionship of a man who had no satisfaction from his own wife, he would have been certain to answer that he could rely upon his daughter, that a man like K. could never be dangerous to her, and that his friend was himself incapable of such intentions, or that Dora was still a child and was treated as a child by K. But as a matter of fact things were in a position in which each of the two men avoided drawing any conclusions from the other's behaviour which would have been awkward for his own plans. It was possible for Herr K. to send Dora flowers every day for a whole year while he was in the neighbourhood, to take every opportunity of giving her valuable presents, and to spend all his spare time in her company, without her parents noticing anything in his behaviour that was characteristic of love-making [*Liebeswerbung*].

When a patient brings forward a sound and incontestable train of argument during psychoanalytic treatment, the physician is liable to feel a moment's embarrassment, and the patient may take advantage of it by asking: 'This is all perfectly correct and true, isn't it? What do you want to change in it now that I've told it you?' But it soon becomes evident that the patient is using thoughts of this kind, which the analysis cannot attack, for the purpose of cloaking others which are anxious to escape from criticism and from consciousness. A string of reproaches against other people leads one to suspect the existence of a string of self-reproaches with the same content. All that need be done is to turn back each particular reproach on to the speaker himself. There is something undeniably automatic about this method of defending oneself against a self-reproach by making the same reproach against someone else. A model of it is to be found in the *tu quoque* arguments of children; if one of them is accused of being a liar, he will reply without an instant's

hesitation: 'You're another.' A grown-up person who wanted to throw back abuse would look for some really exposed spot in his antagonist and would not lay the chief stress upon the same content being repeated. In paranoia the projection of a reproach on to another person without any alteration in its content and therefore without any consideration for reality becomes manifest as the process of forming delusions.

Dora's reproaches against her father had a 'lining' or 'backing' of self- [36]
reproaches of this kind with a corresponding content in every case, as I shall show in detail. She was right in thinking that her father did not wish to look too closely into Herr K.'s behaviour to his daughter, for fear of being disturbed in his own love affair with Frau K. But Dora herself had done precisely the same thing. She had made herself an accomplice in the affair, and had dismissed from her mind every sign which tended to show its true character. It was not until after her adventure by the lake [p. 24] that her eyes were opened and that she began to apply such a severe standard to her father. During all the previous years she had given every possible assistance to her father's relations with Frau K. She would never go to see her if she thought her father was there; but, knowing that in that case the children would have been sent out, she would turn her steps in a direction where she would be sure to meet them, and would go for a walk with them. There had been someone in the house who had been anxious at an early stage to open her eyes to the nature of her father's relations with Frau K., and to induce her to take sides against her. This was her last governess, an unmarried woman, no longer young, who was well read and of advanced views.[1] The teacher and her pupil were for a while upon excellent terms, until suddenly Dora became hostile to her and insisted on her dismissal. So long as the governess had any influence she used it for stirring up feeling against Frau K. She explained to Dora's mother that it was incompatible with her dignity to tolerate such an intimacy between her husband and another woman; and she drew Dora's attention to all the obvious features of their relations. But her efforts were in vain. Dora remained devoted to Frau K. and would hear of nothing that might make her think ill of her relations with her father. On the other hand, she very easily fathomed the motives by which her governess was actuated. She might be blind in one direction, but she was sharp-sighted enough in the other. She saw that the governess was in love with

1 This governess used to read every sort of book on sexual life and similar subjects, and talked to the girl about them, at the same time asking her quite frankly not to mention their conversations to her parents, as one could never tell what line they might take about them. For some time I looked upon this woman as the source of all Dora's secret knowledge, and perhaps I was not entirely wrong in this. [See, however, the footnote on p. 106 below.]

[37] her father. When he was there, she seemed to be quite another person: at such times she could be amusing and obliging. While the family were living in the manufacturing town and Frau K. was not on the horizon, her hostility was directed against Dora's mother, who was then her more immediate rival. Up to this point Dora bore her no ill-will. She did not become angry until she observed that she herself was a subject of complete indifference to the governess, whose pretended affection for her was really meant for her father. While her father was away from the manufacturing town the governess had no time to spare for her, would not go for walks with her, and took no interest in her studies. No sooner had her father returned from B—— than she was once more ready with every sort of service and assistance. Thereupon Dora dropped her.

The poor woman had thrown a most unwelcome light on a part of Dora's own behaviour. What the governess had from time to time been to Dora, Dora had been to Herr K.'s children. She had been a mother to them, she had taught them, she had gone for walks with them, she had offered them a complete substitute for the slight interest which their own mother showed in them. Herr K. and his wife had often talked of getting a divorce; but it never took place, because Herr K., who was an affectionate father, would not give up either of the two children. A common interest in the children had from the first been a bond between Herr K. and Dora. Her preoccupation with his children was evidently a cloak for something else that Dora was anxious to hide from herself and from other people.

The same inference was to be drawn both from her behaviour towards the children, regarded in the light of the governess's behaviour towards herself, and from her silent acquiescence in her father's relations with Frau K. – namely, that she had all these years been in love with Herr K. When I informed her of this conclusion she did not assent to it. It is true that she at once told me that other people besides (one of her cousins, for instance – a girl who had stopped with them for some time at B——) had said to her: 'Why you're simply wild about that man!' But she herself could not be got to recollect any feelings of the kind. Later on, when the quantity of material that had come up had made it difficult for her to persist in her denial, she admitted that she might have been in love with Herr K. at B——, but declared that since the scene by the lake it had all
[38] been over.[1] In any case it was quite certain that the reproaches which she made against her father of having been deaf to the most imperative calls of duty and of having seen things in the light which was most convenient

1 Compare the second dream.

from the point of view of his own passions – these reproaches recoiled on her own head.[1]

Her other reproach against her father was that his ill-health was only a pretext and that he exploited it for his own purposes. This reproach, too, concealed a whole section of her own secret history. One day she complained of a professedly new symptom, which consisted of piercing gastric pains. 'Whom are you copying now?' I asked her, and found I had hit the mark. The day before she had visited her cousins, the daughters of the aunt who had died. The younger one had become engaged, and this had given occasion to the elder one for falling ill with gastric pains, and she was to be sent off to Semmering.[3] Dora thought it was all just envy on the part of the elder sister; she always got ill when she wanted something, and what she wanted now was to be away from home so as not to have to look on at her sister's happiness.[4] But Dora's own gastric pains proclaimed the fact[t] that she identified herself with her cousin, who, according to her, was a malingerer. Her grounds for this identification were either that she too envied the luckier girl her love, or that she saw her own story reflected in that of the elder sister, who had recently had a love affair which had ended unhappily.[5] But she had also learnt from observing Frau K. what useful things illnesses could become. Herr K. spent part of the year in travelling. Whenever he came back, he used to find his wife in bad health, although, as Dora knew, she had been quite well only the day before. Dora realized that the presence of the husband had the effect of making his wife ill, and that she was glad to be ill so as [39]
to be able to escape the conjugal duties which she so much detested. At this point in the discussion Dora suddenly brought in an allusion to her own alternations between good and bad health during the first years of her girlhood at B——; and I was thus driven to suspect that her states of health were to be regarded as depending upon something else, in the same way as Frau K.'s. (It is a rule of psychoanalytic technique that an internal connection which is still undisclosed will announce its presence by means of a contiguity – a temporal proximity – of associations; just as in writing, if '*a*' and '*b*' are put side by side, it means that the syllable '*ab*'

1 The question then arises: If Dora loved Herr K., what was the reason for her refusing him in the scene by the lake? Or at any rate, why did her refusal take such a brutal form, as though she were embittered against him? And how could a girl who was in love feel insulted by a proposition[t] which – as we shall later hear [pp. 88, 94][2] – was made in a manner neither tactless nor offensive?[t]

2 [This clause (see footnote 1 above) was inadvertently omitted in the *SE*.]

3 [A fashionable health resort in the mountains, about fifty miles south of Vienna.]

4 An event of everyday occurrence between sisters.

5 I shall discuss later on what further conclusion I drew from these gastric pains [p. 70 below].

is to be formed out of them.) Dora had had a very large number of attacks of coughing accompanied by loss of voice. Could it be that the presence or absence of the man she loved had had an influence upon the appearance and disappearance of the symptoms of her illness? If this were so, it must be possible to discover some coincidence or other which would betray the fact. I asked her what the average length of these attacks had been. 'From three to six weeks, perhaps.' How long had Herr K.'s absences lasted? 'Three to six weeks, too', she was obliged to admit. Her illness was therefore a demonstration of her love for K., just as his wife's was a demonstration of her *dislike*. It was only necessary to suppose that her behaviour had been the opposite of Frau K.'s and that she had been ill when he was absent and well when he had come back. And this really seemed to have been so, at least during the first period of the attacks. Later on it no doubt became necessary to obscure the coincidence between her attacks of illness and the absence of the man she secretly loved, lest its regularity should betray her secret. The length of the attacks would then remain as a trace of their original significance.

I remembered that long before, while I was working at Charcot's clinic [1885–6], I had seen and heard how in cases of hysterical mutism writing operated vicariously in the place of speech. Such patients were able to write more fluently, quicker and better than others did or than they themselves had done previously. The same thing had happened with Dora. In the first days of her attacks of aphonia 'writing had always come specially easy to her'. No psychological elucidation was really required for this peculiarity, which was the expression of a physiological substitu-
[40] tive function enforced by necessity; it was noticeable, however, that such an elucidation was easily to be found. Herr K. used to write to her at length while he was travelling and to send her picture postcards. It used to happen that she alone was informed as to the date of his return, and that his arrival took his wife by surprise. Moreover, that a person will correspond with an absent friend whom he cannot talk to is scarcely less obvious than that if he has lost his voice he will try to make himself understood in writing. Dora's aphonia, then, allowed of the following symbolic interpretation. When the man she loved was away she gave up speaking; speech had lost its value since she could not speak to *him*. On the other hand, writing gained in importance, as being the only means of communication with him in his absence.

Am I now going on to assert that in every instance in which there are periodical attacks of aphonia we are to diagnose the existence of a loved

person who is at times away from the patient? Nothing could be further from my intention. The determination of Dora's symptoms is far too specific for it to be possible to expect a frequent recurrence of the same accidental aetiology. But, if so, what is the value of our elucidation of the aphonia in the present case? Have we not merely allowed ourselves to become the victims of a *jeu d'esprit*? I think not. In this connection we must recall the question which has so often been raised, whether the symptoms of hysteria are of psychical or of somatic origin, or whether, if the former is granted, they are necessarily *all* of them psychically determined. Like so many other questions to which we find investigators returning again and again without success, this question is not adequately framed. The alternatives stated in it do not cover the real essence of the matter. As far as I can see, every hysterical symptom involves the participation of *both* sides. It cannot occur without the presence of a certain degree of *somatic compliance* [*somatisches Entgegenkommen*][1] offered by some normal or pathological process in or connected with one of the bodily organs. And it cannot occur more than once – and the capacity for repeating itself is one of the characteristics of a hysterical symptom – unless it has a psychical significance, a *meaning* [*eine psychische Bedeutung, einen Sinn*]. The hysterical symptom does not carry this meaning with it, but the meaning is lent to it, [41]
soldered to it, as it were; and in every instance the meaning can be a different one, according to the nature of the suppressed [*unterdrückten*] thoughts which are struggling for expression. However, there are a number of factors at work which tend to make less arbitrary the relations between the unconscious thoughts and the somatic processes that are at their disposal as a means of expression, and which tend to make those relations approximate to a few typical forms. For therapeutic purposes the most important determinants are those given by the fortuitous psychical material; the clearing up of the symptoms is achieved by looking for their psychical significance. When everything that can be got rid of by psychoanalysis has been cleared away, we are in a position to form all kinds of conjectures, which probably meet the facts, as regards the somatic basis of the symptoms – a basis which is as a rule constitutional and organic. Thus in Dora's case we shall not content ourselves with a psychoanalytic interpretation of her attacks of coughing and aphonia; but we shall also indicate the organic factor which was the source of the

1 [This seems to be Freud's earliest use of the term, which scarcely reappears in later works. (See the last words of his paper on psychogenic disturbances of vision, 1910*i*; *RSE*, **11**, 207, and the discussion on masturbation, 1912*f*; ibid., **12**, 244.) Freud had already discussed this factor, though not under the same name, in *Studies on Hysteria* (1895*d*), ibid., **2**, 147 f.]

'somatic compliance' that enabled her to express her love for a man who was periodically absent. And if the connection between the symptomatic expression and the unconscious mental content should strike us as being in this case a clever *tour de force*, we shall be relieved to hear that it succeeds in creating the same impression in every other case and in every other instance.

I am prepared to be told at this point that there is no very great advantage in having been taught by psychoanalysis that the clue to the problem of hysteria is to be found not in 'a peculiar instability of the molecules of the nerves' or in a liability to 'hypnoid states' – but in a 'somatic compliance'. But in reply to the objection I may remark that this new view has not only to some extent pushed the problem further back, but has also to some extent diminished it. We have no longer to deal with the *whole* problem, but only with the portion of it involving that particular characteristic of hysteria *which differentiates it* from other psychoneuroses. The mental events in all psychoneuroses proceed for a considerable distance along the same lines before any question arises of the 'somatic compliance' which may afford the unconscious mental processes a physical outlet. When this factor is not forthcoming, something other than a
[42] hysterical symptom will arise out of the total situation; yet it will still be something of an allied nature, a phobia, perhaps, or an obsession – in short, a psychical symptom.

I now return to the reproach of 'malingering' which Dora brought against her father. It soon became evident that this reproach corresponded to self-reproaches not only concerning her earlier states of ill-health but also concerning the present time. At such points the physician is usually faced with the task of guessing and filling in what the analysis offers him in the shape only of hints and allusions. I was obliged to point out to the patient that her present ill-health was just as much actuated by motives and was just as tendentious as had been Frau K.'s illness, which she had understood so well. There could be no doubt, I said, that she had an aim in view which she hoped to gain by her illness. That aim could be none other than to detach her father from Frau K. She had been unable to achieve this by prayers or arguments; perhaps she hoped to succeed by frightening her father (there was her farewell letter), or by awakening his pity (there were her fainting fits) [p. 22 above], or if all this was in vain, at least she would be taking her revenge on him. She knew very well, I went on, how much he was attached to her, and that tears used to come into his eyes whenever he was asked after his

daughter's health. I felt quite convinced that she would recover at once if only her father were to tell her that he had sacrificed Frau K. for the sake of her health. But, I added, I hoped he would not let himself be persuaded to do this, for then she would have learnt what a powerful weapon she had in her hands, and she would certainly not hesitate on every future occasion to make use once more of her potentiality for illness. Yet if her father refused to give way to her, I was quite sure she would not let herself be deprived of her illness so easily.

I will pass over the details which showed how entirely correct all of this was, and I will instead add a few general remarks upon the part played in hysteria by the *motives of illness* [*Krankheitsmotive*]. A *motive* for being ill is sharply to be distinguished as a concept from a *potentiality for illness* – from the material out of which symptoms are formed. The motives have no share in the formation of symptoms, and indeed are not present at the beginning of the illness. They only appear secondarily to it; but it is not until they have appeared that the disease is fully constituted.[1] Their [43]
presence can be reckoned upon in every case in which there is real suffering and which is of fairly long standing. A symptom comes into the patient's mental life at first as an unwelcome guest; it has everything against it; and that is why it may vanish so easily, apparently of its own accord, under the influence of time. To begin with there is no use to which it can be put in the domestic economy of the mind; but very often it succeeds in finding one secondarily. Some psychical current or other

1 [*Footnote added* 1923:] This is not quite right. The statement that the motives of illness are not present at the beginning of the illness, but appear only secondarily to it, cannot be maintained. In the very next paragraph motives for being ill are mentioned which were in existence before the outbreak of illness, and were partly responsible for that outbreak. I subsequently found a better way of meeting the facts, by introducing a distinction between the *primary and secondary gain from illness*. The motive for being ill is, of course, invariably the securing of some gain. What follows in the later sentences of this paragraph applies to the secondary gain. But in every neurotic illness a primary gain has also to be recognized. In the first place, falling ill involves a saving of psychical effort; it emerges as being economically the most convenient solution where there is a mental conflict (we speak of a 'flight into illness'), even though in most cases the ineffectiveness of such an escape becomes manifest at a later stage. This element in the primary gain may be described as the *internal* or psychological one, and it is, so to say, a constant one. But beyond this, external factors (such as in the instance given [in the following paragraph in the text] of the situation of a woman subjugated by her husband) may contribute motives for falling ill; and these will constitute the *external* element in the primary gain. [This question was already adumbrated by Freud in a letter to Fliess of November 18, 1897 (Freud, 1950*a*, Letter 76). The distinction between the primary and secondary gain from illness was fully discussed in Lecture XXIV of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 338 f., though it had been indicated earlier, in his paper on hysterical attacks (1909*a*), Section B, ibid., **9**, 203, where the term 'flight into illness' was also used. At a much later date he returned to the topic once more (in *Inhibitions, Symptoms and Anxiety*, 1926*d*, particularly in Chapter III; ibid., **20**, 88 f.). The present account of the matter is, however, probably his clearest.]

finds it convenient to make use of it, and in that way the symptom manages to obtain a *secondary function* and remains, as it were, anchored fast in the patient's mental life. And so it happens that anyone who tries to make him well is to his astonishment brought up against a powerful resistance, which teaches him that the patient's intention of getting rid of
[44] his complaint is not so entirely and completely serious as it seemed.[1] Let us imagine a workman, a thatcher,[2] let us say, who has fallen off a house and been crippled, and now earns his livelihood by begging at the street corner. Let us then suppose that a miracle-worker comes along and promises him to make his crooked leg straight and capable of walking. It would be unwise, I think, to look forward to seeing an expression of peculiar bliss upon the man's features. No doubt at the time of the accident he felt he was extremely unlucky, when he realized that he would never be able to do any more work and would have to starve or live upon charity. But since then the very thing which in the first instance threw him out of employment has become his source of income: he lives by his disablement. If that is taken from him he may become totally helpless. He has in the meantime forgotten his trade and lost his habits of industry; he has grown accustomed to idleness and perhaps to drink as well.

The motives for being ill often begin to be active even in childhood. A little girl in her greed for love does not enjoy having to share the affection of her parents with her brothers and sisters; and she notices that the whole of their affection is lavished on her once more whenever she arouses their anxiety by falling ill. She has now discovered a means of enticing out her parents' love, and will make use of that means as soon as she has the necessary psychical material at her disposal for producing an illness. When such a child has grown up to be a woman she may find all the demands she used to make in her childhood countered owing to her marriage with an inconsiderate husband, who may subjugate her will, mercilessly exploit her capacity for work, and lavish neither his affection nor his money upon her. In that case ill-health will be her one weapon for maintaining her position. It will procure her the care she longs for; it will force her husband to make pecuniary sacrifices for her and to show her consideration, as he would never have done while she was well; and it will compel him to treat her with solicitude if she recovers, for otherwise a relapse will threaten. Her state of ill-health will have every

1 A man of letters, who incidentally is also a physician – Arthur Schnitzler – has expressed this piece of knowledge very correctly in his [play] *Paracelsus*.

2 [*Dachdecker*. Mistranslated 'bricklayer' in the *SE*.]

appearance of being objective and involuntary – the very doctor who treats her will bear witness to the fact; and for that reason she will not [45] need to feel any conscious self-reproaches at making such successful use of a means which she had found effective in her years of childhood.

And yet illnesses of this kind *are* the result of intention. They are as a rule levelled at a particular person, and consequently vanish with that person's departure. The crudest and most commonplace views on the character of hysterical disorders – such as are to be heard from uneducated relatives or nurses – are in a certain sense right. It is true that the paralysed and bedridden woman would spring to her feet if a fire were to break out in her room, and that the spoilt wife would forget all her sufferings if her child were to fall dangerously ill or if some catastrophe were to threaten the family circumstances. People who speak of the patients in this way are right except upon a single point: they overlook the psychological distinction between what is conscious and what is unconscious. This may be permissible where children are concerned, but with adults it is no longer possible. That is why all these asseverations that it is 'only a question of willing' and all the encouragements and abuse that are addressed to the patient are of no avail. An attempt must first be made by the roundabout methods of analysis to convince the patient herself of the existence in her of an intention to be ill.

It is in combating the motives of illness that the weak point in every kind of therapeutic treatment of hysteria lies. This is quite generally true, and it applies equally to psychoanalysis. Destiny has an easier time of it in this respect: it need not concern itself either with the patient's constitution or with his pathogenic material; it has only to take away a motive for being ill, and the patient is temporarily or perhaps even permanently freed from his illness. How many fewer miraculous cures and spontaneous disappearances of symptoms should we physicians have to register in cases of hysteria, if we were more often given a sight of the human interests which the patient keeps hidden from us! In one case, some stated period of time has elapsed; in a second, consideration for some other person has ceased to operate; in a third, the situation has been fundamentally changed by some external event – and the whole disorder, which up till then had shown the greatest obstinacy, vanishes at a single blow, apparently of its own accord, but really because it has [46] been deprived of its most powerful motive, one of the uses to which it has been put in the patient's life.

Motives that support the patient in being ill are probably to be found in all fully developed cases. But there are some in which the motives are

purely internal – such as desire for self-punishment, that is, penitence and remorse. It will be found much easier to solve the therapeutic problem in such cases than in those in which the illness is related to the attainment of some external aim.[1] In Dora's case that aim was clearly to touch her father's heart and to detach him from Frau K.

None of her father's actions seemed to have embittered her so much as his readiness to consider the scene by the lake as a product of her imagination [*Phantasie*]. She was almost beside herself at the idea of its being supposed that she had merely fancied something on that occasion. For a long time I was in perplexity as to what the self-reproach could be which lay behind her passionate repudiation of this explanation of the episode. It was justifiable to suspect that there was something concealed, for a reproach which misses the mark gives no lasting offence. On the other hand, I came to the conclusion that Dora's story must correspond to the facts in every respect. No sooner had she grasped Herr K.'s intention than, without letting him finish what he had to say, she had given him a slap in the face and hurried away. Her behaviour must have seemed as incomprehensible to the man after she had left him as to us, for he must long before have gathered from innumerable small signs that he was secure of the girl's affections. In our discussion of Dora's second dream we shall come upon the solution to this riddle as well as upon the self-reproach which we have hitherto failed to discover [p. 94 ff. below].

As she kept on repeating her complaints against her father with a wearisome monotony, and as at the same time her cough continued, I was led to think that this symptom might have some meaning in connection with her father. And apart from this, the explanation of the symptom which I had hitherto obtained was far from fulfilling the requirements which I am accustomed to make of such explanations. According to a
[47] rule which I had found confirmed over and over again by experience, though I had not yet ventured to erect it into a general principle, a symptom signifies the representation – the realization – of a phantasy with a sexual content, that is to say, it signifies a sexual situation. It would be better to say that at least *one* of the meanings of a symptom is the representation of a sexual phantasy, but that no such limitation is imposed upon the content of its other meanings. Anyone who takes up psychoanalytic work will quickly discover that a symptom has more than one

1 [Later, however, Freud took a very different view of the therapeutic difficulties in cases of *unconscious* desire for self-punishment. See, e.g., Chapter V of *The Ego and the Id* (1923*b*), *RSE*, **19**, 44–5.]

meaning and serves to represent several unconscious mental processes simultaneously. And I should like to add that in my estimation a single unconscious mental process or phantasy will scarcely ever suffice for the production of a symptom.

An opportunity very soon occurred for interpreting Dora's nervous cough in this way by means of an imagined sexual situation. She had once again been insisting that Frau K. only loved her father because he was '*ein vermögender Mann*' ['a man of means']. Certain details of the way in which she expressed herself (which I pass over here, like most other purely technical parts of the analysis) led me to see that behind this phrase its opposite lay concealed, namely, that her father was '*ein unvermögender Mann*' ['a man without means']. This could only be meant in a sexual sense – that her father, as a man, was without means, was impotent.[1] Dora confirmed this interpretation from her conscious knowledge; whereupon I pointed out the contradiction she was involved in if on the one hand she continued to insist that her father's relation with Frau K. was a common love affair, and on the other hand maintained that her father was impotent, or in other words incapable of carrying on an affair of such a kind. Her answer showed that she had no need to admit the contradiction. She knew very well, she said, that there was more than one way of obtaining sexual gratification. (The source of this piece of knowledge, however, was once more untraceable.) I questioned her further, whether she referred to the use of organs other than the genitals for the purpose of sexual intercourse, and she replied in the affirmative. I could then go on to say that in that case she must be thinking of precisely those parts of the body which in her case were in a state of irritation – the throat and the oral cavity. To be sure, she would not [48] hear of going so far as this in recognizing her own thoughts; and indeed, if the occurrence of the symptom was to be made possible at all, it was essential that she should not be completely clear on the subject. But the conclusion was inevitable that with her spasmodic cough, which, as is usual, was referred for its exciting stimulus to a tickling in her throat, she pictured to herself a scene of sexual gratification *per os* between the two people whose love affair occupied her mind so incessantly. A very short time after she had tacitly accepted this explanation her cough vanished – which fitted in very well with my view; but I do not wish to lay too much stress upon this development, since her cough had so often before disappeared spontaneously.

1 ['*Unvermögend*' means literally 'unable', and is commonly used in the sense of both 'not rich' and 'impotent'.]

This short piece of the analysis may perhaps have excited in the medical reader – apart from the scepticism to which he is entitled – feelings of astonishment and horror; and I am prepared at this point to look into these two reactions so as to discover whether they are justifiable. The astonishment is probably caused by my daring to talk about such delicate and unpleasant subjects to a young girl – or, for that matter, to any
Geschlecht woman who is sexually active [*im Alter der Geschlechtlichkeit*T]. The horror is aroused, no doubt, by the possibility that an inexperienced girl could know about practices of such a kind and could occupy her imagination with them. I would advise recourse to moderation and reasonableness upon both points. There is no cause for indignation either in the one case or in the other. It is possible for a man to talk to girls and women upon sexual matters of every kind without doing them harm and without bringing suspicion upon himself, so long as, in the first place, he adopts a particular way of doing it, and, in the second place, can make them feel convinced that it is unavoidable. A gynaecologist, after all, under the same conditions, does not hesitate to make them submit to uncovering every possible part of their body. The best way of speaking about such things is to be dry and direct; and that is at the same time the method furthest removed from the prurience with which the same subjects are handled in 'society', and to which girls and women alike are so thoroughly accustomed. I call bodily organs and processes by their technical names, and I tell these to the patient if they – the names, I mean – happen to be unknown to her. *J'appelle un chat un chat*. I have cer-
[49] tainly heard of some people – doctors and laymen – who are scandalized by a therapeutic method in which conversations of this sort occur, and who appear to envy either me or my patients the titillation which, according to their notions, such a method must afford. But I am too well acquainted with the respectability of these gentry to excite myself over them. I shall avoid the temptation of writing a satire upon them. But there is one thing that I will mention: often, after I have for some time treated a patient who had not at first found it easy to be open about sexual matters, I have had the satisfaction of hearing her exclaim: 'Why, after all, your treatment is far more respectable than Mr X's conversation!'

No-one can undertake the treatment of a case of hysteria until he is convinced of the impossibility of avoiding the mention of sexual subjects, or unless he is prepared to allow himself to be convinced by experience. The right attitude is: '*pour faire une omelette il faut casser des oeufs*.' The patients themselves are easy to convince; and there are

only too many opportunities of doing so in the course of the treatment. There is no necessity for feeling any compunction at discussing the facts of normal or abnormal sexual life with them. With the exercise of a little caution all that is done is to translate [*übersetzt*][T] into conscious ideas what was already known in the unconscious; and, after all, the whole effectiveness of the treatment is based upon our knowledge that the affect attached to an unconscious idea operates more strongly and, since it cannot be inhibited [*unhemmbar*][T], more injuriously than the affect attached to a conscious one. There is never any danger of corrupting an inexperienced girl. For where there is no knowledge of sexual processes even in the unconscious, no hysterical symptom will arise; and where hysteria is found there can no longer be any question of 'innocence of mind' in the sense in which parents and educators use the phrase. With children of ten, of twelve, or of fourteen, with boys and girls alike, I have satisfied myself that the truth of this statement can invariably be relied upon.

Hemmung

As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient – supposing that my view of her is correct – and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual drives [*Triebe*][T] to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced with a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions – instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repellent to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree – now in this direction, now in that – beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs

[50]

all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims – by being 'sublimated' [*Sublimierung*][I] – are destined to provide the energy for a great number of our cultural achievements. When, therefore, anyone has *become* a gross and manifest pervert, it would be more correct to say that he has *remained* one, for he exhibits a certain stage of *inhibited development*. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious *phantasies* show precisely the same content as the documentarily recorded *actions* of perverts – even though they have not read Krafft-Ebing's *Psychopathia Sexualis*, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the *negative* of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any acci-
[51] dental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The driving forces [*Triebkräfte*][T] leading to the formation [*Bildung*][T] of hysterical symptoms draw their strength not only from repressed *normal* sexuality but also from unconscious perverse activities [*Regungen*].[2]

The less repellent of the so-called sexual perversions are very widely diffused among the whole population, as everyone knows except medical writers upon the subject. Or, I should rather say, they know it too; only they take care to forget it at the moment when they take up their pens to write about it. So it is not to be wondered at that this hysterical girl of nearly[3] nineteen, who had heard of the occurrence of such a method of sexual intercourse (sucking at the male organ), should have developed an unconscious phantasy of this sort and should have given it expression by an irritation in her throat and by coughing. Nor would it have been very extraordinary if she had arrived at such a phantasy even without having had any enlightenment from external sources – an occurrence which I have quite certainly observed in other patients. For in her

1 [Cf. the second of Freud's *Three Essays* (1905*d*), this volume, p. 158 f.]

2 These remarks upon the sexual perversions had been written some years before the appearance of Bloch's excellent book (*Beiträge zur Ätiologie der Psychopathia sexualis*, 1902 and 1903). See also my *Three Essays on the Theory of Sexuality*, published this year [1905*d*, particularly the first essay (this volume, pp. 121–53), in which most of the points in the present paragraph are enlarged upon. For the following paragraph, see the third section of the second essay (p. 162 ff. below)].

3 [This word was added in 1924. See footnote 2, p. 19 above.]

case a noteworthy fact afforded the necessary somatic prerequisite for this independent creation of a phantasy which would coincide with the practices of perverts. She remembered very well that in her childhood she had been a thumbsucker. Her father, too, recollected breaking her of the habit after it had persisted into her fourth or fifth year. Dora herself had a clear picture of a scene from her early childhood in which she was sitting on the floor in a corner sucking her left thumb and at the same time tugging with her right hand at the lobe of her brother's ear as he sat quietly beside her. Here we have an instance of the complete form of self-gratification by sucking, as it has also been described to me by other patients, who had subsequently become anaesthetic and hysterical.

One of these patients gave me a piece of information which sheds a [52] clear light on the origin of this curious habit. This young woman had never broken herself of the habit of sucking. She retained a memory of her childhood, dating back, according to her, to the first half of her second year, in which she saw herself sucking at her nurse's breast and at the same time pulling rhythmically at the lobe of her nurse's ear. No-one will feel inclined to dispute, I think, that the mucous membrane of the lips and mouth is to be regarded as a primary 'erotogenic zone',[1] since it preserves this earlier significance in the act of kissing, which is looked upon as normal. An intense activity of this erotogenic zone at an early age thus determines the subsequent presence of a somatic compliance on the part of the tract of mucous membrane which begins at the lips. Thus, at a time when the sexual object proper, that is, the male organ, has already become known, circumstances may arise which once more increase the excitation [*Erregung*] of the oral zone, whose erotogenic character has, as we have seen, been retained. It then needs very little creative power to substitute the sexual object of the moment (the penis) for the original object (the nipple) or for the finger which does duty for it, and to place the current sexual object in the situation in which satisfaction was originally obtained. So we see that this excessively repulsive and perverted phantasy of sucking at a penis has the most innocent origin. It is a new version of what may be described as a prehistoric impression of sucking at the mother's or nurse's breast – an impression which has usually been revived by contact with children who are being nursed. In most instances a cow's udder has aptly played the part of an image intermediate between a nipple and a penis.[2]

1 [Cf. Section 5 of the first of Freud's *Three Essays* (1905*d*), this volume, p. 149 f.]

2 [See the confirmation of this detail in the case of 'Little Hans', Freud (1909*b*), *RSE*, **10**, 6–7.]

The interpretation we have just been discussing of Dora's throat symptoms may also give rise to a further remark. It may be asked how this sexual situation imagined by her can be compatible with our other explanation of the symptoms. That explanation, it will be remembered,
[53] was to the effect that the coming and going of the symptoms reflected the presence and absence of the man she was in love with, and, as regards his wife's behaviour, expressed the following thought: 'If *I* were his wife, I should love him in quite a different way; I should be ill (from longing, let us say) when he was away, and well (from joy) when he was home again.' To this objection I must reply that my experience in the clearing up of hysterical symptoms has shown that it is not necessary for the various meanings of a symptom to be compatible with one another, that is, to fit together into a connected whole. It is enough that the unity should be constituted by the subject matter which has given rise to all the various phantasies. In the present case, moreover, compatibility even of the first kind is not out of the question. One of the two meanings is related more to the cough, and the other to the aphonia and the periodicity of the disorder. A closer analysis would probably have disclosed a far greater number of mental elements in relation to the details of the illness.

We have already learnt that it quite regularly happens that a single symptom corresponds to several meanings *simultaneously*. We may now add that it can express several meanings *in succession*. In the course of years a symptom can change its meaning or its chief meaning, or the leading role can pass from one meaning to another. It is as though there were a conservative trait in the character of neuroses which ensures that a symptom that has once been formed shall if possible be retained, even though the unconscious thought to which it gave expression has lost its meaning. Moreover, there is no difficulty in explaining this tendency towards the retention of a symptom upon a mechanical basis. The production of a symptom of this kind is so difficult, the translation of a purely psychical excitation into physical terms – the process which I have called 'conversion'[1] – depends on the concurrence of so many favourable conditions, the somatic compliance necessary for conversion is so seldom forthcoming, that an impulsion towards the discharge [*Abfuhr*][T] of an unconscious excitation [*Erregung*] will so far as possible make use of any channel for discharge which may already be in existence. It appears to be far more difficult to create a fresh conversion than to form paths of association [*Assoziationsbeziehungen*] between a new
[54] thought which is in need of discharge and the old one which is no longer

1 [The term 'conversion' was introduced by Freud in Section I of his first paper on the neuropsychoses of defence (1894*a*), *RSE*, **3**, 46.]

in need of it. The current flows along these paths from the new source of excitation to the old point of discharge – pouring into the symptom, in the words of the Gospel, like new wine into an old bottle. These remarks would make it seem that the somatic side of a hysterical symptom is the more stable of the two and the harder to replace, while the psychical side is a variable element for which a substitute can more easily be found. Yet we should not try to infer anything from this comparison as regards the relative importance of the two elements. From the point of view of mental therapeutics the mental side must always be the more significant.

Dora's incessant repetition of the same thoughts about her father's relations with Frau K. made it possible to derive still further important material from the analysis.

A train of thought such as this may be described as excessively intense, or better *reinforced*, or 'supervalent' ['*überwertiger*'] in Wernicke's [1900, 140] sense. It shows its pathological character in spite of its apparently reasonable content, by the single peculiarity that no amount of conscious and voluntary effort of thought on the patient's part is able to dissipate or remove it. A normal train of thought, however intense it may be, can eventually be disposed of. Dora felt quite rightly that her thoughts about her father needed to be judged in a special way. 'I can think of nothing else', she complained again and again. 'I know my brother says we children have no right to criticize this behaviour of Father's. He declares that we ought not to trouble ourselves about it, and ought even to be glad, perhaps, that he has found a woman he can love, since Mother understands him so little. I can quite see that, and I should like to think the same as my brother, but I can't. I can't forgive him for it.'[1]

Now what is one to do in the face of a supervalent thought like this, after one has heard what its conscious grounds are and listened to the ineffectual protests made against it? Reflection will suggest that *this excessively intense train of thought must owe its reinforcement to the unconscious*. It cannot be resolved by any effort of thought, either because it itself reaches with its root down into unconscious, repressed material, or because another unconscious thought lies concealed behind it. In the latter case, the concealed thought is usually the direct contrary of the supervalent one. Contrary thoughts are always closely connected with each other and are often paired off in such a way that *the one thought is excessively intensely conscious while its counterpart is* [55]

1 A supervalent thought of this kind is often the only symptom, beyond deep depression, of a pathological condition which is usually described as 'melancholia', but which can be cleared up by psychoanalysis like a hysteria.

repressed and unconscious. This relation between the two thoughts is an effect of the process of repression. For repression is often achieved by means of an excessive reinforcement of the thought contrary to the one which is to be repressed. This process I call *reactive* reinforcement, and the thought which asserts itself with excessive intensity in consciousness and (in the same way as a prejudice) cannot be removed I call a *reactive thought*. The two thoughts then act towards each other much like the two needles of an astatic galvanometer. The reactive thought keeps the objectionable one under repression by means of a certain surplus of intensity; but for that reason it itself is 'damped' and proof against conscious efforts of thought. So that the way to deprive the excessively intense thought of its reinforcement is by bringing its repressed contrary into consciousness.[1]

We must also be prepared to meet with instances in which the supervalence of a thought is due not to the presence of one only of these two causes but to a concurrence of both of them. Other complications, too, may arise, but they can easily be fitted into the general scheme.

Let us now apply our theory to the instance provided by Dora's case.[2] We will begin with the first hypothesis, namely, that her preoccupation with
[56] her father's relations to Frau K. owed its obsessive character to the fact that its root was unknown to her and lay in the unconscious. It is not difficult to divine the nature of that root from her circumstances and her conduct. Her behaviour obviously went far beyond what would have been appropriate to filial concern. She felt and acted more like a jealous wife – in a way which would have been comprehensible in her mother. By her ultimatum to her father ('either her or me'), by the scenes she used to make, by the suicidal intentions she allowed to transpire – by all this she was clearly putting herself in her mother's place. If we have rightly guessed the nature of the imaginary sexual situation which underlay her cough, in that phantasy she must have been putting herself in Frau K.'s place. She was therefore identifying herself both with the woman her father had once loved and with the woman he loved now. The inference is obvious that her affection for her father was a much stronger one than she knew or than she would have cared to admit: in fact, that she was in love with him.

1 [The subject of 'excessively intense' ideas had been discussed at some length (and on much the same lines) in the first two sections of Part II of his posthumously published 'Project for a Scientific Psychology' in 1895. (See Freud, 1950*a*; *RSE*, **1**.)]

2 [Of the two possibilities – viz. that the supervalent thought may be due (*a*) to *direct* and (*b*) to *reactive* reinforcement from the unconscious – (*a*) is discussed in this and the next two paragraphs, while (*b*) is shown to be present in two forms – the first of which is considered in the three paragraphs that follow, and the second in the remainder of the section.]

I have learnt to look upon unconscious love relations like this (which are marked by their abnormal consequences) – between a father and a daughter, or between a mother and a son – as a revival of germs of feeling in infancy. I have shown at length elsewhere[1] at what an early age sexual attraction makes itself felt between parents and children, and I have explained that the legend of Oedipus is probably to be regarded as a poetical rendering of what is typical in these relations. Distinct traces are probably to be found in most people of an early partiality of this kind – on the part of a daughter for her father, or on the part of a son for his mother; but it must be assumed to be more intense from the very first in the case of those children whose constitution marks them down for a neurosis, who develop prematurely and have a craving for love. At this point certain other influences, which need not be discussed here, come into play, and lead to a fixation of this rudimentary feeling of love or to a reinforcement of it; so that it turns into something (either while the child is still young or not until it has reached the age of puberty) which must be put on a par with a sexual inclination and which, like the latter, has the forces of the libido at its command.[2] The external circumstances [57]
of our patient were by no means unfavourable to such an assumption. The nature of her disposition had always drawn her towards her father, and his numerous illnesses were bound to have increased her affection for him. In some of these illnesses he would allow no-one but her to discharge the lighter duties of nursing. He had been so proud of the early growth of her intelligence that he had made her his confidante while she was still a child. It was really she and not her mother whom Frau K.'s appearance had driven out of more than one position.

When I told Dora that I could not avoid supposing that her affection for her father must at a very early moment have amounted to her being completely in love with him, she of course gave me her usual reply: 'I don't remember that.' But she immediately went on to tell me something analogous about a seven-year-old girl who was her cousin (on her mother's side) and in whom she often thought she saw a kind of reflection of her own childhood. This little girl had (not for the first time) been the witness to a heated dispute between her parents, and, when Dora happened to come in on a visit soon afterwards, whispered in her ear: 'You can't think how I hate that person!' (pointing to her mother), 'and when she's dead I shall marry Daddy.' I am in the habit of regarding

1 In my *Interpretation of Dreams*, 1900*a* [Chapter V, Section D (*β*); *RSE*, **4**, 228 ff.], and in the third of my *Three Essays*, 1905*d* [this volume, p. 200 f.].

2 The decisive factor in this connection is no doubt the early appearance of true genital sensations, either spontaneously or as a result of seduction or masturbation. (See below [p. 69 f.].)

associations such as this, which bring forward something that agrees with the content of an assertion of mine, as a confirmation from the unconscious of what I have said. No other kind of 'Yes' can be extracted from the unconscious; there is no such thing at all as an unconscious 'No'.[1]

[58] For years on end she had given no expression to this passion for her father. On the contrary, she had for a long time been on the closest terms with the woman who had supplanted her with her father, and she had actually, as we know from her self-reproaches, facilitated this woman's relations with her father. Her own love for her father had therefore been recently revived; and, if so, the question arises to what end this had happened. Clearly as a reactive symptom, so as to suppress something else – something, that is, that still exercised power in the unconscious. Considering how things stood, I could not help supposing in the first instance that what was suppressed was her love of Herr K. I could not avoid the assumption that she was still in love with him, but that, for unknown reasons, since the scene by the lake her love had aroused in her violent feelings of opposition, and that the girl had brought forward and reinforced her old affection for her father in order to avoid any further necessity for paying conscious attention to the love which she had felt in the first years of her girlhood and which had now become distressing to her. In this way I gained an insight into a conflict which was well calculated to unhinge the girl's mind. On the one hand she was filled with regret at having rejected the man's proposal [*Antrag*], and with longing for his company and all the little signs of his affection; while on the other hand these feelings of tenderness and longing were combated by powerful forces, among which her pride was one of the most obvious. Thus she had succeeded in persuading herself that she had done with Herr K. – that was the advantage she derived from this typical process of repression; and yet she was obliged to summon up her infantile affection for her father and to exaggerate it, in order to protect herself against the feelings of love which were constantly pressing forward into consciousness. The further fact that she was almost incessantly a prey to the most embittered jealousy seemed to admit of still another determination.[2]

1 [*Footnote added* 1923:] There is another very remarkable and entirely trustworthy form of confirmation from the unconscious, which I had not recognized at the time this was written: namely, an exclamation on the part of the patient of 'I didn't think that', or 'I didn't think of that'. This can be translated point-blank into: 'Yes, I was unconscious of that.' [See the longer discussions on this subject in Freud's paper on 'Negation' (1925*h*), *RSE*, **19**, 240 f., and in the first two sections of his 'Constructions in Analysis' (1937*d*), ibid., **23**, 233 f. and 238 f.]

2 We shall come upon this [in a moment].

My expectations were by no means disappointed when this explanation of mine was met by Dora with a most emphatic negative. The 'No' uttered by a patient after a repressed thought has been presented to his conscious perception for the first time does no more than register the existence of a repression and its severity; it acts, as it were, as a gauge of the repression's strength. If this 'No', instead of being regarded as the expression of an impartial judgement (of which, indeed, the patient is [59] incapable), is ignored, and if work is continued, the first evidence soon begins to appear that in such a case 'No' signifies the desired 'Yes'. Dora admitted that she found it impossible to be as angry with Herr K. as he had deserved. She told me that one day she had met Herr K. in the street while she was walking with a cousin of hers who did not know him. The other girl had exclaimed all at once: 'Why, Dora, what's wrong with you? You've gone as white as a sheet!' She herself had felt nothing of this change of colour; but I explained to her that the expression of emotion and the play of features obey the unconscious rather than the conscious, and are a means of betraying the former.[1] Another time Dora came to me in the worst of tempers after having been uniformly cheerful for several days. She could give no explanation for this. She felt so contrary today, she said; it was her uncle's birthday, and she could not bring herself to congratulate him, she did not know why. My powers of interpretation were at a low ebb that day; I let her go on talking, and she suddenly recollected that it was Herr K.'s birthday too – a fact which I did not fail to use against her. And it was then no longer hard to explain why the handsome presents she had had on her own birthday a few days before had given her no pleasure. One gift was missing, and that was Herr K.'s, the gift which had plainly once been the most prized of all.

Nevertheless, Dora persisted in denying my contention for some time longer, until, towards the end of the analysis, the conclusive proof of its correctness came to light [p. 96 below].

I must now turn to consider a further complication to which I should certainly give no space if I were a man of letters engaged upon the creation of a mental state like this for a short story, instead of being a

1 Compare the lines:

Ruhig mag ich Euch erscheinen,
Ruhig gehen sehn.

[Quiet can I watch thy coming,
Quiet watch thee go.

The words (from Schiller's ballad 'Ritter Toggenburg') are addressed to a knight on his departure for the Crusades by his ostensibly indifferent but in fact devoted lady-love.]

medical man engaged upon its dissection. The element to which I must now allude can only serve to obscure and efface the outlines of the fine
[60] poetic conflict which we have been able to ascribe to Dora. This element would rightly fall a sacrifice to the censorship of a writer, for he, after all, simplifies and abstracts when he appears in the character of a psychologist. But in the world of reality, which I am trying to depict here, a complication of motives, an accumulation and conjunction of mental activities – in a word, overdetermination – is the rule. For behind Dora's supervalent train of thought which was concerned with her father's relations with Frau K. there lay concealed a feeling of jealousy which had that lady as its *object* – a feeling, that is, which could only be based upon an affection on Dora's part for one of her own sex. It has long been known and often been pointed out that at the age of puberty boys and girls show clear signs, even in normal cases, of the existence of an affection for people of their own sex. A romantic and sentimental friendship with one of her schoolfriends, accompanied by vows, kisses, promises of eternal correspondence, and all the sensibility of jealousy, is the common precursor to a girl's first serious passion for a man. Thenceforward, in favourable circumstances, the homosexual current of feeling often runs completely dry. But if a girl is not happy in her love for a man, the current is often set flowing again by the libido in later years and is increased up to a greater or lesser degree of intensity. If this much can be established without difficulty of healthy persons, and if we take into account what has already been said [p. 45 f. above] about the fuller development in neurotics of the normal germs of perversion, we shall expect to find in these latter too a fairly strong homosexual predisposition. It must, indeed, be so; for I have never yet come through a single psychoanalysis of a man or a woman without having to take into account a very considerable current of homosexuality. When, in a hysterical woman or girl, the sexual libido which is directed towards men has been energetically suppressed, it will regularly be found that the libido which is directed towards women has become vicariously reinforced and even to some extent conscious.

I shall not in this place go any further into this important subject, which is especially indispensable to an understanding of hysteria in men, because Dora's analysis came to an end before it could throw any light on this side of her mental life. But I should like to recall the governess, whom I have already mentioned [p. 33 f.], and with whom Dora had at
[61] first enjoyed the closest interchange of thought, until she discovered that she was being admired and fondly treated not for her own sake but for her father's; whereupon she had obliged the governess to leave. She used

also to dwell with noticeable frequency and a peculiar emphasis on the story of another estrangement which appeared inexplicable even to herself. She had always been on particularly good terms with the younger of her two cousins – the girl who had later on become engaged [p. 35 above] – and had shared all sorts of secrets with her. When, for the first time after Dora had broken off her stay by the lake, her father was going back to B——, she had naturally refused to go with him. This cousin had then been asked to travel with him instead, and she had accepted the invitation. From that time forward Dora had felt a coldness towards her, and she herself was surprised to find how indifferent she had become, although, as she admitted, she had very little ground for complaint against her. These instances of sensitiveness led me to enquire what her relations with Frau K. had been up till the time of the breach. I then found that the young woman and the scarcely grown girl had lived for years on a footing of the closest intimacy. When Dora stayed with the K.s she used to share a bedroom with Frau K., and the husband used to be quartered elsewhere. She had been the wife's confidante and adviser in all the difficulties of her married life. There was nothing they had not talked about. Medea had been quite content that Creusa should make friends with her two children; and she certainly did nothing to interfere with the relations between the girl and the children's father. How Dora managed to fall in love with the man about whom her beloved friend had so many bad things to say is an interesting psychological problem. We shall not be far from solving it when we realize that thoughts in the unconscious live very comfortably side by side, and even contraries get on together without disputes – a state of things which persists often enough even in the conscious.

When Dora talked about Frau K., she used to praise her 'adorable white body' in accents more appropriate to a lover than to a defeated rival. Another time she told me, more in sorrow than in anger, that she was convinced the presents her father had brought her had been chosen by Frau K., for she recognized her taste. Another time, again, she pointed out that, evidently through the agency of Frau K., she had been given a [62]
present of some jewellery which was exactly like some that she had seen in Frau K.'s possession and had wished for aloud at the time. Indeed, I can say in general that I never heard her speak a harsh or angry word against the lady, although from the point of view of her supervalent thought she should have regarded her as the prime author of her misfortunes. She seemed to behave inconsequently; but her apparent inconsequence was precisely the manifestation of a complicating current

of feeling. For how had this woman to whom Dora was so enthusiastically devoted behaved to her? After Dora had brought forward her accusation against Herr K., and her father had written to him and had asked for an explanation, Herr K. had replied in the first instance by protesting sentiments of the highest esteem for her and by proposing that he should come to the manufacturing town to clear up every misunderstanding. A few weeks later, when her father spoke to him at B——, there was no longer any question of esteem. On the contrary, Herr K. spoke of her with disparagement, and produced as his trump card the reflection that no girl who read such books and was interested in such things could have any title to a man's respect. Frau K., therefore, had betrayed her and had calumniated her; for it had only been with her that she had read Mantegazza and discussed forbidden topics. It was a repetition of what had happened with the governess: Frau K. had not loved her for her own sake but on account of her father. Frau K. had sacrificed her without a moment's hesitation so that her relations with her father might not be disturbed. This mortification touched her, perhaps, more nearly and had a greater pathogenic effect than the other one, which she tried to use as a screen for it – the fact that she had been sacrificed by her father. Did not the obstinacy with which she retained the particular amnesia concerning the sources of her forbidden knowledge [p. 29 above] point directly to the great emotional importance for her of the accusation against her upon that score, and consequently to her betrayal by her friend?

I believe, therefore, that I am not mistaken in supposing that Dora's supervalent train of thought, which was concerned with her father's relations with Frau K., was designed not only for the purpose of suppressing her love for Herr K., which had once been conscious, but also to conceal her love for Frau K., which was in a deeper sense unconscious.
[63] The supervalent train of thought was directly contrary to the latter current of feeling. She told herself incessantly that her father had sacrificed her to this woman, and made noisy demonstrations to show that she grudged her the possession of her father; and in this way she concealed from herself the contrary fact, which was that she grudged her father Frau K.'s love, and had not forgiven the woman she loved for the disillusionment she had been caused by her betrayal. The jealous emotions of a woman were linked in the unconscious with a jealousy such as might have been felt by a man. These masculine or, more properly speaking, *gynaecophilic* currents of feeling are to be regarded as typical of the unconscious erotic life of hysterical girls.[1]

1 [See the footnote on p. 106 below.]

II
THE FIRST DREAM

Just at a moment when there was a prospect that the material that was coming up for analysis would throw light upon an obscure point in Dora's childhood, she reported that a few nights earlier she had once again had a dream which she had already dreamt in exactly the same way on many previous occasions. A periodically recurrent dream was by its very nature particularly well calculated to arouse my curiosity; and in any case it was justifiable in the interests of the treatment to consider the way in which the dream worked into the analysis as a whole. I therefore determined to make an especially careful investigation of it. [64]

Here is the dream as related by Dora:[t] '*A house was on fire.*[1] *My father was standing beside my bed and woke me up. I dressed quickly. Mother wanted to stop and save her jewel case; but Father said: "I refuse to let myself and my two children be burnt for the sake of your jewel case." We hurried downstairs, and as soon as I was outside I woke up.*'

As the dream was a recurrent one, I naturally asked her when she had first dreamt it. She told me she did not know. But she remembered having had the dream three nights in succession at L—— (the place on the lake where the scene with Herr K. had taken place), and it had now come back again a few nights earlier, here [in Vienna].[2] My expectations from the clearing up of the dream were naturally heightened when I heard of its connection with the events at L——. But I wanted to discover first what had been the exciting cause of its recent recurrence, and I therefore asked Dora to take the dream bit by bit and tell me what occurred to her in connection with it. She had already had some training in dream interpretation [*Traumdeutung*] from having previously analysed a few minor specimens.

'Something occurs to me,' she said, 'but it cannot belong to the dream, for it is quite recent, whereas I have certainly had the dream before.' [65]

1 In answer to an enquiry Dora told me that there had never really been a fire at their house.

2 The content of the dream makes it possible to establish that it, in fact, occurred *for the first time* at L——.

'That makes no difference,' I replied. 'Start away! It will simply turn out to be the most recent thing that fits in with the dream.'

'Very well, then. Father has been having a dispute with Mother in the last few days, because she locks the dining-room door at night. My brother's room, you see, has no separate entrance, but can only be reached through the dining room. Father does not want my brother to be locked in like that at night. He says it will not do: something might happen in the night so that it might be necessary to leave the room.'

'And that made them[1] think of the risk of fire?'

'Yes.'

'Now, I should like you to pay close attention to the exact words you used. We may have to come back to them. You said that "*something might happen in the night so that it might be necessary to leave the room*."'[2]

But Dora had now discovered the connecting link between the recent exciting cause of the dream and the original one, for she continued:

'When we arrived at L—— that time, Father and I, he openly said he was afraid of fire. We arrived in a violent thunderstorm, and saw the small wooden house without any lightning conductor. So his anxiety was quite natural.'

What I now had to do was to establish the relation between the events at L—— and the recurrent dreams which she had had there. I therefore said: 'Did you have the dream during your first nights at L—— or during your last ones? in other words, before or after the scene in the wood by the lake of which we have heard so much?' (I must explain that I knew that the scene had not occurred on the very first day, and that she had remained at L—— for a few days after it without giving any hint of the incident.)

[66] Her first reply was that she did not know, but after a while she added: 'Yes. I think it was after the scene.'

So now I knew that the dream was a reaction to that experience. But why had it recurred there three times? I continued my questions: 'How long did you stop on at L—— after the scene?'

'Four more nights. On the following day I went away with Father.'

'Now I am certain that the dream was an immediate effect of your experience with Herr K. It was at L—— that you dreamt it for the first

1 [Mistranslated as 'you' in the *SE*.]

2 I laid stress on these words because they took me aback. They seemed to have an ambiguous ring about them. Are not certain physical needs referred to in the same words? Now, in a line of associations ambiguous words (or, as we may call them, 'switch-words' [*Wechsel*]) act like points at a junction. If the points are switched across from the position in which they appear to lie in the dream, then we find ourselves on another set of rails; and along this second track run the thoughts which we are in search of but which still lie concealed behind the dream.

time, and not before. You have only introduced this uncertainty in your memory so as to obliterate the connection in your mind.[1] But the figures do not quite fit in to my satisfaction yet. If you stayed at L—— for four nights longer, the dream might have occurred four times over. Perhaps this was so?'

She no longer disputed my contention; but instead of answering my question she proceeded:[2] 'In the afternoon after our trip on the lake, from which we (Herr K. and I) returned at midday, I had gone to lie down as usual on the sofa in the bedroom to have a short sleep. I suddenly awoke and saw Herr K. standing beside me. . . .'

'In fact, just as you saw your father standing beside your bed in the dream?'

'Yes. I asked him sharply what it was he wanted there. By way of reply he said he was not going to be prevented from coming into his own bedroom when he wanted; besides, there was something he wanted to fetch. This episode put me on my guard, and I asked Frau K. whether there was not a key to the bedroom door. The next morning I locked myself in while I was dressing. That afternoon, when I wanted to lock myself in so as to lie down again on the sofa, the key was gone. I was convinced that Herr K. had removed it.'

'Then here we have the theme of locking or not locking a room which appeared in the first association to the dream[3] and also happened to occur in the exciting cause of the recent recurrence[t] of the dream.[4] I wonder whether the phrase "*I dressed quickly*" may not also belong to this context?' [67]

'It was then that I made up my mind not to stop on with the K.s without Father. On the subsequent mornings I could not help feeling afraid that Herr K. would surprise me while I was dressing: *so I always dressed very quickly*. You see, Father lived at the hotel, and Frau K. used always to go out early so as to go on expeditions with him. But Herr K. did not annoy me again.'

'I understand. On the afternoon of the day after the scene in the wood you formed your intention of escaping from his persecution, and during

1 Compare what was said on p. 17 on the subject of doubt accompanying a recollection.

2 This was because a fresh piece of material had to emerge from her memory before the question I had put could be answered.

3 [In the editions before 1924 this read: 'which appeared in the dream'.]

4 I suspected, though I did not as yet say so to Dora, that she had seized upon this element on account of a symbolic meaning which it possessed. '*Zimmer*' ['room'] in dreams stands very frequently for '*Frauenzimmer*' [a slightly derogatory word for 'woman'; literally 'women's apartment']. The question whether a woman is 'open' or 'shut' can naturally not be a matter of indifference. It is well known, too, what sort of 'key' effects the opening in such a case.

the second, third and fourth nights you had time to repeat that intention in your sleep. (You already knew on the second afternoon – before the dream, therefore – that you would not have the key on the following morning to lock yourself in with while you were dressing; and you could then form the design of dressing as quickly as possible.) But your dream recurred each night, for the very reason that it corresponded to an *intention*. An intention remains in existence until it has been carried out. You said to yourself, as it were: "I shall have no rest and I can get no quiet sleep until I am out of this house." In your account of the dream you turned it the other way and said: "*As soon as I was outside I woke up*."'

At this point I shall interrupt my report of the analysis in order to compare this small piece of dream interpretation with the general statements I have made upon the mechanism of the formation of dreams. I argued in my book, *The Interpretation of Dreams* (1900*a*), that every dream is a wish which is represented as fulfilled, that the representation acts as a disguise if the wish is a repressed one, belonging to the unconscious, and that except in the case of children's dreams only an unconscious wish or one which reaches down into the unconscious has the force necessary for
[68] the formation of a dream. I fancy my theory would have been more certain of general acceptance if I had contented myself with maintaining that every dream had a meaning, which could be discovered by means of a certain process of interpretation; and that when the interpretation had been completed the dream could be replaced with thoughts which would fall into place at an easily recognizable point in the waking mental life of the dreamer. I might then have gone on to say that the meaning of a dream turned out to be of as many different sorts as the processes of waking thought; that in one case it would be a fulfilled wish, in another a realized fear, or again a reflection persisting on into sleep, or an intention (as in the instance of Dora's dream), or a piece of creative thought during sleep, and so on. Such a theory would no doubt have proved attractive from its very simplicity, and it might have been supported by a great many examples of dreams that had been satisfactorily interpreted, as for instance by the one which has been analysed in these pages.

But instead of this I formulated a generalization according to which the meaning of dreams is limited to a single form, to the representation of *wishes*, and by so doing I aroused a universal inclination to dissent. I must, however, observe that I did not consider it either my right or my duty to simplify a psychological process so as to make it more acceptable to my readers, when my researches had shown me that it presented a

complication which could not be reduced to uniformity until the enquiry had been carried into another field. It is therefore of special importance to me to show that apparent exceptions – such as this dream of Dora's, which has shown itself in the first instance to be the continuation into sleep of an intention formed during the day – nevertheless lend fresh support to the rule which is in dispute. [See p. 75 ff. below.]

Much of the dream, however, still remained to be interpreted, and I proceeded with my questions: 'What is this about the jewel case that your mother wanted to save?'

'Mother is very fond of jewellery and had had a lot given her by Father.'

'And you?'

'I used to be very fond of jewellery too, once; but I have not worn any since my illness. – Once, four years ago (a year before the dream),[1] Father and Mother had a great dispute about a piece of jewellery. Mother [69] wanted to be given a particular thing – pearl drops to wear in her ears. But Father does not like that kind of thing, and he brought her a bracelet instead of the drops. She was furious, and told him that as he had spent so much money on a present she did not like he had better just give it to someone else.'

'I dare say you thought to yourself you would accept it with pleasure.'

'I don't know.[2] I don't in the least know how Mother comes into the dream; she was not with us at L—— at the time.'[3]

'I will explain that to you presently. Does nothing else occur to you in connection with the jewel case? So far, you have only talked about jewellery and have said nothing about a case.'

'Yes, Herr K. had made me a present of an expensive jewel case a little time before.'

'Then a return present would have been very appropriate. Perhaps you do not know that "jewel case" ["*Schmuckkästchen*"] is a favourite expression for the same thing that you alluded to not long ago by means of the reticule you were wearing[4] – for the female genitals, I mean.'

1 [Four years earlier actually implies two years before the dream. In the *SE* translation this error is inadvertently assigned to Freud rather than 'Dora'.]

2 The regular formula with which she confessed to anything that had been repressed.

3 This remark gave evidence of a complete misunderstanding of the rules of dream interpretation, though on other occasions Dora was perfectly familiar with them. This fact, coupled with the hesitancy and meagreness of her associations with the jewel case, showed me that we were here dealing with material which had been very intensely repressed.

4 This reference to the reticule will be explained further on [p. 68 below].

'I knew *you* would say that.'[1]

'That is to say, *you* knew that it *was* so. – The meaning of the dream is now becoming even clearer. You said to yourself: "This man is persecuting me; he wants to force his way into my room. My 'jewel case' is in danger, and if anything happens it will be Father's fault." For that reason in the dream you chose a situation which expresses the opposite – a danger from which your father is *saving* you. In this part of the dream
[70] everything is turned into its opposite; you will soon discover why. As you say, the mystery turns upon your mother. You ask how she comes into the dream? She is, as you know, your former rival in your father's affections. In the incident of the bracelet, you would have been glad to accept what your mother had rejected. Now let us just put "give" instead of "accept" and "withhold" instead of "reject". Then it means that you were ready to give your father what your mother withheld from him; and the thing in question was connected with jewellery.[2] Now bring your mind back to the jewel case which Herr K. gave you. You have there the starting point for a parallel line of thoughts, in which Herr K. is to be put in the place of your father just as he was in the matter of standing beside your bed. He gave you a jewel case; so you are to give him your jewel case. That was why I spoke just now of a "return present". In this line of thoughts your mother must be replaced by Frau K. (You will not deny that she, at any rate, was present at the time.) So you are ready to give Herr K. what his wife withholds from him. That is the thought which has had to be repressed with so much energy, and which has made it necessary for every one of its elements to be turned into its opposite. The dream confirms once more what I had already told you before you dreamt it – that you are summoning up your old love for your father in order to protect yourself against your love for Herr K. But what do all these efforts show? Not only that you are afraid of Herr K., but that you are still more afraid of yourself, and of the temptation you feel to yield to him. In short, these efforts prove once more how deeply you loved him.'[3]

1 A very common way of putting aside a piece of knowledge that emerges from the repressed.

2 We shall be able later on to interpret even the drops in a way which will fit in with the context [p. 79 ff. below].

3 I added: 'Moreover, the reappearance of the dream in the last few days forces me to the conclusion that you consider that the same situation has arisen once again, and that you have decided to give up the treatment – to which, after all, it is only your father who makes you come.' The sequel showed how correct my guess had been. At this point my interpretation touches for a moment upon the subject of 'transference' – a theme which is of the highest practical and theoretical importance, but into which I shall not have much further opportunity of entering in the present paper. [See, however, p. 102 ff. below.]

Naturally Dora would not follow me in this part of the interpretation. I myself, however, had been able to arrive at a further step in the interpretation, which seemed to me indispensable both for the anamnesis of the case and for the theory of dreams. I promised to communicate this [71] to Dora at the next session.

The fact was that I could not forget the hint which seemed to be conveyed by the ambiguous words already noticed – *that it might be necessary to leave the room; that an accident might happen in the night*. Added to this was the fact that the elucidation of the dream seemed to me incomplete so long as a particular requirement remained unsatisfied; for, though I do not wish to insist that this requirement is a universal one, I have a predilection for discovering a means of satisfying it.[1] A regularly formed dream stands, as it were, upon two legs, one of which is in contact with the main and current exciting cause, and the other with some momentous event in the years of childhood. The dream sets up a connection between those two factors – the event during childhood and the event of the present day – and it endeavours to reshape the present on the model of the remote past.[2] For the wish which creates the dream always springs from the period of childhood; and it is continually trying to summon childhood back into reality and to correct the present day by the measure of childhood. I believed that I could already clearly detect those elements of Dora's dream which could be pieced together into an allusion to an event in childhood.

I opened the discussion of the subject with a little experiment, which was, as usual, successful. There happened to be a large match-stand on the table. I asked Dora to look round and see whether she noticed anything special on the table, something that was not there as a rule. She noticed nothing. I then asked her if she knew why children were forbidden to play with matches.

'Yes; on account of the risk of fire. My uncle's children are very fond of playing with matches.'

'Not only on that account. They are warned not to "play with fire", and a particular belief is associated with the warning.'

She knew nothing about it. – 'Very well, then; the fear is that if they do [72] they will wet their bed. The antithesis of "water" and "fire" must be at the bottom of this. Perhaps it is believed that they will dream of fire and

1 [See *The Interpretation of Dreams* (1900*a*), end of Section B of Chapter V; *RSE*, **4**, 193.]

2 [Cf. the last sentence of *The Interpretation of Dreams* (ibid., **5**, 555).]

then try to put it out with water. I cannot say exactly.[1] But I notice that the antithesis of water and fire has been extremely useful to you in the dream. Your mother wanted to save the jewel case so that it should not be *burnt*; while in the dream thoughts it is a question of the "jewel case" not being *wetted*. But fire is not only used as the contrary of water, it also serves directly to represent love (as in the phrase "to be *consumed* with love"). So that from "fire" one set of rails runs by way of this symbolic meaning to thoughts of love; while the other set runs by way of the contrary "water", and, after sending off a branch line which provides another connection with "love" (for love also makes things wet), leads in a different direction. And what direction can that be? Think of the expressions you used: that *an accident might happen in the night*, and that *it might be necessary to leave the room*. Surely the allusion must be to a physical need? And if you transpose the accident into childhood what can it be but bedwetting? But what is usually done to prevent children from wetting their bed? Are they not woken up in the night out of their sleep, *exactly as your father woke you up in the dream*? This, then, must be the actual occurrence which enabled you to substitute your father for Herr K., who really woke you up out of your sleep. I am accordingly driven to conclude that you were addicted to bedwetting up to a later age than is usual with children. The same must also have been true of your brother; for your father said: "*I refuse to let my two children* go to their destruction. . . ." Your brother has no other sort of connection with the real situation at the K.s'; he had not gone with you to L——. And now, what have your recollections to say to this?'

'I know nothing about myself,' was her reply, 'but my brother used to wet his bed up till his sixth or seventh year; and it used sometimes to happen to him in the daytime too.'

I was on the point of remarking to her how much easier it is to remember things of that kind about one's brother than about oneself, when she continued the train of recollections which had been revived: 'Yes. I used to do it too, for some time, but not until my seventh or eighth
[73] year. It must have been serious, because I remember now that the doctor was called in. It lasted till a short time before the appearance of my nervous asthma.' [p. 20 f. above.]

'And what did the doctor say to it?'

1 [Freud returned to this question three or four times – at greatest length in his paper on the Acquisition of Fire (1932*a*), *RSE*, **22**, 201 ff.]

'He explained it as nervous weakness; it would soon pass off, he thought; and he prescribed a tonic.'[1]

The interpretation of the dream now seemed to me to be complete.[2] But Dora brought me an addendum [*Nachtrag*] to the dream on the very next day. She had forgotten to relate, she said, that each time after waking up she had smelt smoke. Smoke, of course, fitted in well with fire, but it also showed that the dream had a special relation to myself; for when she used to assert that there was nothing concealed behind this or that, I would often say by way of rejoinder: 'There can be no smoke without fire!' Dora objected, however, to such a purely personal interpretation, saying that Herr K. and her father were passionate smokers – as I am too, for the matter of that. She herself had smoked during her stay by the lake, and Herr K. had rolled a cigarette for her before he began his unlucky proposition [*Werbung*]. She thought, too, that she clearly remembered having noticed the smell of smoke on the three occasions of the dream's occurrence at L——, and not for the first time at its recent reappearance. As she would give me no further information, it was left to me to determine how this addendum was to be introduced into the texture of the dream thoughts. One thing which I had to go upon was the fact that the smell of smoke had only come up as an addendum to the dream, and must therefore have had to overcome a particularly strong effort on the part of repression.[3] Accordingly it was probably related to the thoughts which were the most obscurely presented and the most successfully repressed in the dream, to the thoughts, that is, concerned with the temptation to show herself willing to yield to the man. If that were so, the addendum to the dream could scarcely mean anything else than [74]
the longing for a kiss, which, with a smoker, would necessarily smell of smoke. But a kiss had passed between Herr K. and Dora some two years further back [p. 26 above],[4] and it would certainly have been repeated more than once if she had given way to him. So the thoughts of temptation seemed in this way to have harked back to the earlier scene, and to have revived the memory of the kiss against whose seductive influence

1 This physician was the only one in whom she showed any confidence, because this episode showed her that he had not penetrated her secret. She felt afraid of any other doctor about whom she had not yet been able to form a judgement, and we can now see that the motive of her fear was the possibility that he might guess her secret.

2 The essence of the dream might perhaps be translated into words such as these: 'The temptation is so strong. Dear Father, protect me again as you used to in my childhood, and prevent my bed from being wetted!'

3 [See below, p. 89 *n*. 3.]

4 [In the editions before 1924 this read 'a year further back'.]

the little 'thumbsucker' had defended herself at the time, by the feeling of disgust. Taking into consideration, finally, the indications which seemed to point to there having been a transference on to me – since I am a smoker too – I came to the conclusion that the idea had probably occurred to her one day during a session that she would like to have a kiss from me. This would have been the exciting cause which led her to repeat the warning dream and to form her intention of stopping the treatment. Everything fits together very satisfactorily upon this view; but owing to the characteristics of 'transference' its validity is not susceptible to definite proof. [Cf. pp. 103–4 and *n*. below.]

I might at this point hesitate whether I should first consider the light thrown by this dream on the history of the case, or whether I should rather begin by dealing with the objection to my theory of dreams which may be based on it. I shall take the former course.

The significance of enuresis in the early history of neurotics is worth going into thoroughly. For the sake of clearness I will confine myself to remarking that Dora's case of bedwetting was not the usual one.[1] The disorder was not simply that the habit had persisted beyond what is considered the normal period, but, according to her explicit account, it had begun by disappearing and had then returned at a relatively late age – after her sixth year [p. 64 above]. Bedwetting of this kind has, to the best of my knowledge, no more likely cause than masturbation, a habit whose importance in the aetiology of bedwetting in general is still insufficiently appreciated. In my experience, the children concerned have themselves at one time been very well aware of this connection, and all its psychological consequences follow from it as though they had never forgotten it.
[75] Now, at the time when Dora reported the dream, we were engaged upon a line of enquiry which led straight towards an admission that she had masturbated in childhood. A short while before, she had raised the question of why it was that precisely she had fallen ill, and, before I could answer, had put the blame on her father. The justification for this was forthcoming not out of her unconscious thoughts but from her conscious knowledge. It turned out, to my astonishment, that the girl knew what the nature of her father's illness had been. After his return from consulting me [p. 18 f.] she had overheard a conversation in which the name of the disease had been mentioned. At a still earlier period – at the time of the detached retina [p. 18] – an oculist who was called in must have hinted at a luetic aetiology; for the inquisitive and anxious girl overheard an old

1 [Cf. the second of Freud's *Three Essays* (1905*d*), this volume, p. 168.]

aunt of hers saying to her mother: 'He was ill before his marriage, you know', and adding something which she could not understand, but which she subsequently connected in her mind with improper subjects.

Her father, then, had fallen ill through leading a loose life, and she assumed that he had handed on his bad health to her by heredity. I was careful not to tell her that, as I have already mentioned [p. 20 *n*. 1], I too was of the opinion that the offspring of luetics were very specially predisposed to severe neuropsychoses. The line of thought in which she brought this accusation against her father was continued in her unconscious material. For several days on end she identified herself with her mother by means of slight symptoms and peculiarities of manner, which gave her an opportunity for some really remarkable achievements in the direction of intolerable behaviour. She then allowed it to transpire that she was thinking of a stay she had made at Franzensbad,[1] which she had visited with her mother – I forget in what year. Her mother was suffering from abdominal pains and from a discharge (a catarrh) which necessitated a cure at Franzensbad. It was Dora's view – and here again she was probably right – that this illness was due to her father, who had thus handed on his venereal disease to her mother. It was quite natural that in drawing this conclusion she should, like the majority of laymen, have confused gonorrhoea and syphilis, as well as what is contagious and what is hereditary. The persistence with which she held to this identification with her mother almost forced me to ask her whether she [76] too was suffering from a venereal disease; and I then learnt that she was afflicted with a catarrh (leucorrhoea) whose beginning, she said, she could not remember.

I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a *self*-accusation. I met her halfway by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.[2] I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill – by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step

1 [The Bohemian spa.]

2 [*Footnote added* 1923:] This is an extreme view which I should no longer maintain today.

towards the confession. For on that day she wore at her waist – a thing she never did on any other occasion before or after – a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it – opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.[1] I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we
[77] usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: 'Why should I not wear a reticule like this, as it is now the fashion to do?' But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though, on the other hand, the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them – namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient – a lady who was no longer young – brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to

1 See my *Psychopathology of Everyday Life* (1901*b*) [Chapter IX; *RSE*, **6**, 165].

open. I expressed my suspicion that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box – [in German] *Dose*, *πυξίς* – like the reticule and the jewel case, was once again only a substitute for the shell of Venus, for the female genitals.

There is a great deal of symbolism of this kind in life, but as a rule we pass it by without heeding it. When I set myself the task of bringing to light what human beings keep hidden within them, not by the compelling power [*Zwang*] of hypnosis, but by observing what they say and what they show, I thought the task was a harder one than it really is. He that has eyes to see and ears to hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters with his fingertips; betrayal oozes out of him at every pore. And thus the task of making conscious the most hidden recesses of the mind is one which it is quite possible to accomplish. [78]

Dora's symptomatic act with the reticule did not immediately precede the dream. She started the session which brought us the narrative of the dream with another symptomatic act. As I came into the room in which she was waiting she hurriedly concealed a letter which she was reading. I naturally asked her whom the letter was from, and at first she refused to tell me. Something then came out which was a matter of complete indifference and had no relation to the treatment. It was a letter from her grandmother, in which she begged Dora to write to her more often. I believe that Dora only wanted to play 'secrets' with me, and to hint that she was on the point of allowing her secret to be torn from her by the doctor. I was then in a position to explain her antipathy to every new doctor. She was afraid lest he might arrive at the foundation of her illness, either by examining her and discovering her catarrh, or by questioning her and eliciting the fact of her addiction to bedwetting – lest he might guess, in short, that she had masturbated. And afterwards she would speak very contemptuously of the doctor whose perspicacity she had evidently overestimated beforehand. [Cf. p. 65 *n.* 1 above.]

The reproaches against her father for having made her ill, together with the self-reproach underlying them, the leucorrhoea, the playing with the reticule, the bedwetting after her sixth year, the secret which she would not allow the doctors to tear from her – the circumstantial evidence of her having masturbated in childhood seems to me complete

and without a flaw. In the present case I had begun to suspect the masturbation when she had told me of her cousin's gastric pains [p. 35 above], and had then identified herself with her by complaining for days together of similar painful sensations. It is well known that gastric pains occur especially often in those who masturbate. According to a personal communication made to me by Wilhelm Fliess, it is precisely gastralgias of this character which can be interrupted by an application of cocaine to the 'gastric spot' discovered by him in the nose, and which can be cured by the cauterization of the same spot.[1] In confirmation of
[79] my suspicion Dora gave me two facts from her conscious knowledge: she herself had frequently suffered from gastric pains, and she had good reasons for believing that her cousin was a masturbator. It is a very common thing for patients to recognize in other people a connection which, on account of their emotional resistances, they cannot perceive in themselves. And, indeed, Dora no longer denied my supposition, although she still remembered nothing. Even the date which she assigned to the bedwetting, when she said that it 'lasted till a short time before the appearance of my nervous asthma' [p. 64], appears to me to be of clinical significance. Hysterical symptoms hardly ever appear so long as children are masturbating, but only afterwards, when a period of abstinence has set in;[2] they form a substitute for masturbatory satisfaction, the desire for which continues to persist in the unconscious until another and more normal kind of satisfaction appears – where that is still attainable. For upon whether it is still attainable or not depends the possibility of a hysteria being cured by marriage and normal sexual intercourse. But if the satisfaction afforded in marriage is again removed – as it may be owing to *coitus interruptus*, psychological estrangement, or other causes – then the libido flows back again into its old channel and manifests itself once more in hysterical symptoms.

I should like to be able to add some definite information as to when and under what particular influence Dora gave up masturbating; but owing to the incompleteness of the analysis I have only fragmentary material to present. We have heard that the bedwetting lasted until shortly before she first fell ill with dyspnoea. Now the only light she was able to throw upon this first attack was that at the time of its occurrence her father was away from home for the first time since his health had

1 [Some account of this can be found in Section I of Kris's introduction to Freud's correspondence with Fliess (Freud, 1950*a*).]

2 This is also true in principle of adults; but in their case a *relative* abstinence, a diminution in the amount of masturbation, is a sufficient cause, so that, if the libido is very strong, hysteria and masturbation may be simultaneously present.

improved. In this small recollection there must be a trace of an allusion to the aetiology of the dyspnoea. Dora's symptomatic acts and certain other signs gave me good reasons for supposing that the child, whose bedroom had been next door to her parents', had overheard her father in his wife's room at night and had heard him (for he was always short of breath) breathing hard while they had intercourse. Children, in such [80] circumstances, divine something sexual in the uncanny sounds that reach their ears. Indeed, the movements expressive of sexual excitement lie within them ready to hand, as innate pieces of mechanism. I maintained years ago that the dyspnoea and palpitations that occur in hysteria and anxiety neurosis are only detached fragments of the act of copulation;[1] and in many cases, as in Dora's, I have been able to trace back the symptom of dyspnoea or nervous asthma to the same exciting cause – to the patient's having overheard sexual intercourse taking place between adults. The sympathetic excitement which may be supposed to have occurred in Dora on such an occasion may very easily have made the child's sexuality veer round and have replaced her inclination to masturbation with an inclination to anxiety. A little while later, when her father was away and the child, devotedly in love with him, was wishing him back, she must have reproduced in the form of an attack of asthma the impression she had received. She had preserved in her memory the event which had occasioned the first onset of the symptom, and we can conjecture from it the nature of the train of thought, charged with anxiety, which had accompanied the attack. The first attack had come on after she had overexerted herself on an expedition in the mountains [p. 20 above], so that she had probably been really a little out of breath. To this was added the thought that her father was forbidden to climb mountains and was not allowed to overexert himself, because he suffered from shortness of breath; then came the recollection of how much he had exerted himself with her mother that night, and the question whether it might not have done him harm; next came concern whether *she* might not have overexerted herself in masturbating – an act which, like the other, led to a sexual orgasm accompanied by slight dyspnoea – and finally came a return of the dyspnoea in an intensified form as a symptom. Part of this material I was able to obtain directly from the analysis, but the rest required supplementing. But the way in which the occurrence of masturbation in Dora's case was verified has already shown us

1 [In Section III of Freud's first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 100. Much later he put forward another explanation of the physical accompaniments of anxiety, in Chapter VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 117–18.]

[81] that material belonging to a single subject can only be collected piece by piece at various times and in different connections.[1]

There now arises a whole series of questions of the greatest importance concerning the aetiology of hysteria: is Dora's case to be regarded as aetiologically typical? does it represent the only type of causation? and so on. Nevertheless, I am sure that I am taking the right course in postponing my answer to such questions until a considerable number of other cases have been similarly analysed and published. Moreover, I should have to begin by criticizing the way in which the questions are framed. Instead of answering 'Yes' or 'No' to the question whether the aetiology of this case is to be looked for in masturbation during childhood, I should first have to discuss the concept of aetiology as applied to the psychoneuroses.[2] It would then become evident that the standpoint
[82] from which I should be able to answer the question would be very widely removed from the standpoint from which it was put. Let it suffice if we can reach the conviction that in this case the occurrence of masturbation in childhood is established, and that its occurrence cannot be an accidental element nor an immaterial one in the conformation of the clinical picture.[3]

1 The proof of infantile masturbation in other cases is established in a very similar way. The evidence for it is mostly of a similar nature: indications of the presence of leucorrhoea, bedwetting, hand ceremonials (obsessional washing), and such things. It is always possible to discover with certainty from the nature of the symptoms of the case whether the habit was discovered by the person in charge of the child or not, or whether this sexual activity was brought to an end by long efforts on the child's part to break itself of the habit, or by a sudden change. In Dora's case the masturbation had remained undiscovered, and had come to an end at a single blow (cf. her secret, her fear of doctors, and the replacement by dyspnoea). The patients, it is true, invariably dispute the conclusiveness of circumstantial evidence such as this, and they do so even when they have retained a conscious recollection of the catarrh or of their mother's warning (e.g. 'That makes people stupid; it's dangerous'). But some time later the memory, which has been so long repressed, of this piece of infantile sexual life emerges with certainty, and it does so in every instance. I am reminded of the case of a patient of mine suffering from obsessions [*Zwangsvorstellungen*], which were direct derivatives of infantile masturbation. Her peculiarities, such as self-prohibitions and self-punishments, the feeling that if she had done this she must not do that, the idea that she must not be interrupted, the introduction of pauses between one procedure (with her hands) and the next, her hand-washing, etc. – all of these turned out to be unaltered fragments of her nurse's efforts to break her of the habit. The only thing which had remained permanently in her memory were the words of warning: 'Ugh! That's dangerous!' Compare also in this connection my *Three Essays on the Theory of Sexuality*, 1905*d* [the section on 'Masturbatory Sexual Manifestations' in the second essay (this volume, p. 164 ff.)].

2 [The various uses of the term 'aetiology' as applied to the neuroses were analysed by Freud in his second paper on anxiety neurosis (1895*f*), *RSE*, **3**, 109 ff.]

3 Dora's brother must have been concerned in some way with her having acquired the habit of masturbation; for in this connection she told me, with all the emphasis which betrays the presence of a 'screen memory' [*Deckerinnerung*][T], that her brother used regularly to pass on all his infectious illnesses to her, and that while he used to have them lightly she used, on the contrary, to have them severely [p. 21 above]. In the dream her brother as well as she was saved from 'destruction' [p. 57]; he, too, had been subject to bedwetting, but had got over the habit before his

A consideration of the significance of the leucorrhoea to which Dora admitted promises to give us a still better understanding of her symptoms. She had learnt to call her affection a 'catarrh' at the time when her mother had had to visit Franzensbad on account of a similar complaint [p. 67 above]; and the word 'catarrh' acted once again as a 'switch-word' [p. 58 *n*. 2], and enabled the whole set of thoughts upon her father's responsibility for her illness to manifest themselves in the symptom of the cough. The cough, which no doubt originated in the first instance from a slight actual catarrh, was, moreover, an imitation of her father (whose lungs were affected), and could serve as an expression of her sympathy and concern for him. But besides this, it proclaimed aloud, as it were, something of which she may then have been still unconscious: 'I am my father's daughter. I have a catarrh, just as he has. He has made me ill, just as he has made Mother ill. It is from him that I have got my evil passions, which are punished by illness.'[1]

Let us next attempt to put together the various determinants that we [83] have found for Dora's attacks of coughing and hoarseness. In the lowest stratum we must assume the presence of a real and organically determined irritation of the throat – which acted like the grain of sand around which an oyster forms its pearl. This irritation was susceptible to fixation [*fixierbar*], because it concerned a part of the body which in Dora had to a high degree retained its significance as an erotogenic zone. And the irritation was consequently well fitted to give expression to excited states of the libido. It was brought to fixation by what was probably its first psychical coating – her sympathetic imitation of her ill father – and by her subsequent self-reproaches on account of her 'catarrh'. The same group of symptoms, moreover, showed itself capable of representing her relations with Herr K.; it could express her regret at his absence

sister [p. 64]. Her declaration that she had been able to keep abreast with her brother up to the time of her first illness, but that after that she had fallen behind him in her studies, was in a certain sense also a 'screen memory'. It was as though she had been a boy up till that moment, and had then become girlish for the first time. She had in truth been a wild creature; but after the 'asthma' she became quiet and well behaved. That illness formed the boundary between two phases of her sexual life, of which the first was masculine in character, and the second feminine.

1 This word ['catarrh'] played the same part with the fourteen-year-old girl whose case history I have compressed into a few lines on p. 23 *n*. I had established the child in a pension with an intelligent lady, who took charge of her for me. The lady reported that the little girl could not bear her to be in the room while she was going to bed, and that when she was in bed she had a marked cough, of which there was no trace in the daytime. When the girl was questioned about these symptoms, the only thing that occurred to her was that her grandmother coughed in the same way, and that she was said to have a catarrh. It was clear from this that the child herself had a catarrh, and that she did not want to be observed while she performed her evening ablutions. This catarrh, which, thanks to its name, had been *displaced from the lower to the upper part of her body* [see p. 28 above], exhibited a quite unusual degree of intensity.

and her wish to make him a better wife. After a part of her libido had once more turned towards her father, the symptom obtained what was perhaps its last meaning; it came to represent sexual intercourse with her father by means of Dora's identifying herself with Frau K. I can guarantee that this series is by no means complete. Unfortunately, an incomplete analysis cannot enable us to follow the chronological sequence of the changes in a symptom's meaning, or to display clearly the succession and coexistence of its various meanings. It may legitimately be expected of a complete analysis that it should fulfil these demands.

I must now proceed to touch upon some further relations existing between Dora's genital catarrh and her hysterical symptoms. At a time when any psychological elucidation of hysteria was still very remote, I used to hear experienced fellow doctors who were my seniors maintain that in the case of hysterical patients suffering from leucorrhoea any increase in the catarrh was regularly followed by an intensification of the hysterical troubles, and especially of loss of appetite and vomiting.
[84] No-one was very clear about the nature of the connection, but I fancy the general inclination was towards the opinion held by gynaecologists. According to their hypothesis, as is well known, disorders of the genitals exercise upon the nervous functions a direct and far-reaching influence in the nature of an organic disturbance – though a therapeutic test of this theory is apt to leave one in the lurch. In the light of our present knowledge we cannot exclude the possibility of the existence of a direct organic influence of this sort; but it is at all events easier to indicate its psychical coating. The pride taken by women in the appearance of their genitals is quite a special feature of their vanity; and disorders of the genitals which they think calculated to inspire[t] feelings of repugnance or even disgust have an incredible power of humiliating them, of lowering their self-esteem, and of making them irritable, sensitive and distrustful. An abnormal secretion of the mucous membrane of the vagina is looked upon as a source of disgust.

It will be remembered that Dora had a lively feeling of disgust after being kissed by Herr K., and that we saw grounds for completing her story of the scene of the kiss by supposing that, while she was being embraced, she noticed the pressure of the man's erect member against her body [p. 27 ff. above]. We now learn further that the same governess whom Dora cast off on account of her faithlessness had, from her own experience of life, propounded to Dora the view that all men were frivolous and untrustworthy. To Dora that must mean that all men were like her father. But she thought her father suffered from venereal

disease – for had he not handed it on [*übertragen*] to her and her mother? She might therefore have imagined to herself that all men suffered from venereal disease, and naturally her conception of venereal disease was modelled on her one experience of it – a personal one at that. To suffer from venereal disease, therefore, meant for her to be afflicted with a disgusting discharge. So may we not have here a further motive for the disgust she felt at the moment of the embrace? Thus the disgust which was transferred on to the contact of the man would be a feeling which had been projected according to the primitive mechanism I have already mentioned (p. 32 f.), and would be related ultimately to her own leucorrhoea.

I suspect that we are here concerned with unconscious processes of thought which are twined around a pre-existing structure of organic connections, much as festoons of flowers are twined around a wire; so [85] that on another occasion one might find other lines of thought inserted between the same points of departure and termination. Yet a knowledge of the thought connections which have been effective in the individual case is of a value which cannot be exaggerated for clearing up the symptoms. It is only because the analysis was prematurely broken off that we have been obliged in Dora's case to resort to framing conjectures and filling in deficiencies. Whatever I have brought forward for filling in the gaps is based upon other cases which have been more thoroughly analysed.

The dream from the analysis of which we have derived this information corresponded, as we have seen, to an intention which Dora carried with her into her sleep. It was therefore repeated each night until the intention had been carried out; and it reappeared years later when an occasion arose for forming an analogous intention. The intention might have been consciously expressed in some such words as these: 'I must fly from this house, for I see that my virginity is threatened here; I shall go away with my father, and I shall take precautions not to be surprised while I am dressing in the morning.' These thoughts were clearly expressed in the dream; they formed part of a mental current which had achieved consciousness and a dominating position in waking life. Behind them can be discerned obscure traces of a train of thought which formed part of a contrary current and had consequently been suppressed. This other train of thought culminated in the temptation to yield to the man, out of gratitude for the love and tenderness he had shown her during the last few years, and it may perhaps have revived the memory of the only kiss

she had so far had from him. But according to the theory which I developed in my *Interpretation of Dreams* such elements as these are not enough for the formation of a dream. On that theory a dream is not an intention represented as having been carried out, but a wish represented as having been fulfilled, and, moreover, in most cases a wish dating from childhood. It is our business now to discover whether this principle may not be contradicted by the present dream.

The dream does in fact contain infantile material, though it is impossible at first glance to discover any connections between that material and Dora's intention of flying from Herr K.'s house and the
[86] temptation of his presence. Why should a recollection have emerged of her bedwetting when she was a child and of the trouble her father used to take to teach the child clean habits? We may answer this by saying that it was only by the help of this train of thought that it was possible to suppress the other thoughts which were so intensely occupied with the temptation to yield or that it was possible to secure the dominance of the intention which had been formed of combating those other thoughts. The child decided to fly *with* her father; in reality she fled *to* her father because she was afraid of the man who was pursuing her; she summoned up an infantile affection for her father so that it might protect her against her present affection for a stranger. Her father was himself partly responsible for her present danger, for he had handed her over to this strange man in the interests of his own love affair. And how much better it had been when that same father of hers had loved no-one more than her, and had exerted all his strength to save her from the dangers that had then threatened her! The infantile, and now unconscious, wish to put her father in the strange man's place had the potency necessary for the formation of a dream. If there were a past situation similar to a present one, and differing from it only in being concerned with one instead of with the other of the two persons mentioned in the wish, that situation would become the main one in the dream. But there *had* been such a situation. Her father had once stood beside her bed, just as Herr K. had the day before, and had woken her up, with a kiss perhaps, as Herr K. may have meant to do. Thus her intention of flying from the house was not in itself capable of producing a dream; but it became so by being associated with another intention which was founded upon infantile wishes. The wish to replace Herr K. with her father provided the necessary driving force [*Triebkraft*] for the dream. Let me recall the interpretation I was led to adopt of Dora's reinforced train of thought about her father's relations with Frau K. My interpretation was that she had at that point

summoned up an infantile affection for her father so as to be able to keep her repressed love for Herr K. in its state of repression [p. 52 above]. This same sudden revulsion in the patient's mental life was reflected in the dream.

I have made one or two observations in my *Interpretation of Dreams*[1] on the relation between the waking thoughts which are continued into [87] sleep (the 'day's residues') and the unconscious wish which forms the dream. I will quote them here as they stand, for I have nothing to add to them, and the analysis of this dream of Dora's proves afresh that the facts are as I have supposed: 'I am ready to admit that there is a whole class of dreams the *instigation* to which arises principally or even exclusively from the residues of daytime life; and I think that even my wish that I might at long last become a Professor Extraordinarius[2] might have allowed me to sleep through the night in peace if my worry over my friend's health had not still persisted from the previous day. But the worry alone could not have made a dream. The *driving force* which the dream required had to be provided by a wish; it was the business of the worry to get hold of a wish to act as the driving force of the dream.

'The position may be explained by an analogy. A daytime thought may very well play the part of *entrepreneur* for a dream; but the entrepreneur, who, as people say, has the idea and the initiative to carry it out, can do nothing without capital; he needs a *capitalist* who can afford the outlay, and the capitalist who provides the psychical outlay for the dream is invariably and indisputably, whatever may be the thoughts of the previous day, *a wish from the unconscious*.'

Anyone who has learnt to appreciate the delicacy of the fabric of structures such as dreams will not be surprised to find that Dora's wish that her father might take the place of the man who was her tempter called up in her memory not merely a casual collection of material from her childhood, but precisely such material as was most intimately bound up with the suppression of her temptation. For if Dora felt unable to yield to her love for the man, if in the end she repressed that love instead of surrendering to it, there was no factor upon which her decision depended more directly than upon her premature sexual enjoyment and its consequence – her bedwetting, her catarrh and her disgust. An early history of this kind can afford a basis for two kinds of behaviour in response to the

1 [Chapter VII, Section C; *RSE*, **5**, 501 f.]

2 This is a reference to the analysis of a dream quoted in the book as an example [the dream of 'Otto looking ill', in Chapter V, Section D (ibid., **4**, 239 f.)].

demands of love in maturity – which of the two will depend upon the summation of constitutional determinants in the subject. He will either
[88] exhibit an abandonment to sexuality which is entirely without resistances and borders upon perversity; or there will be a reaction – he will repudiate sexuality, and will at the same time fall ill of a neurosis. In the case of our present patient, her constitution and the high level of her intellectual and moral upbringing decided in favour of the latter course.

I should like, further, to draw special attention to the fact that the analysis of this dream has given us access to certain details of the pathogenically operative events which had otherwise been inaccessible to memory, or at all events to reproduction. The recollection of the bed-wetting in childhood had, as we have seen, already been repressed. And Dora had never mentioned the details of her persecution by Herr K.; they had never occurred to her mind.

I add a few remarks which may help towards the synthesis of this dream.[1] The dream-work began on the afternoon of the day after the scene in the wood, after Dora had noticed that she was no longer able to lock the door of her room [p. 59 above]. She then said to herself: 'I am threatened by a serious danger here,' and formed her intention of not stopping on in the house alone but of going off with her father. This intention became capable of forming a dream, because it succeeded in finding a continuation in the unconscious. What corresponded to it there was her summoning up her infantile love for her father as a protection against the present temptation. The change which thus took place in her became fixed and brought her into the attitude shown by her supervalent train of thought – jealousy of Frau K. on her father's account, as though she herself were in love with him. There was a conflict within her between a temptation to yield to the man's proposition and a composite force rebelling against that feeling. This latter force was made up of motives of respectability and good sense, of hostile feelings caused by the governess's disclosures (jealousy and wounded pride, as we shall see later [p. 94 f.]), and of a neurotic element, namely, the tendency to a repudiation of sexuality which was already present in her and was based on
[89] her childhood history. Her love for her father, which she summoned up to protect her against the temptation, had its origin in this same childhood history.

1 [The remainder of this section was printed as a footnote in editions earlier than 1924. On the subject of the 'synthesis' of dreams see *The Interpretation of Dreams* (1900*a*), Chapter VI, Section C; *RSE*, **4**, 276.]

Her intention of flying to her father, which, as we have seen, reached down into the unconscious, was transformed by the dream into a situation which presented as fulfilled the wish that her father should save her from the danger. In this process it was necessary to put on one side a certain thought which stood in the way; for it was her father himself who had brought her into the danger. The hostile feeling against her father (her desire for revenge), which was here suppressed, was, as we shall discover, one of the motive forces [*Motoren*] of the second dream [p. 87 f. below].

According to the necessary conditions of dream formation the imagined situation must be chosen so as to reproduce a situation in infancy. A special triumph is achieved if a recent situation, perhaps even the very situation which is the exciting cause of the dream, can be transformed into an infantile one. This has actually been achieved in the present case, by a purely chance disposition of the material. Just as Herr K. had stood beside her sofa and woken her up, so her father had often done in her childhood. The whole trend of her thoughts could be most aptly symbolized by her substitution of her father for Herr K. in that situation.

But the reason for which her father used to wake her up long ago had been to prevent her from making her bed wet.

This 'wet' had a decisive influence on the further content of the dream; though it was represented in it only by a distant allusion and by its opposite.

The opposite of 'wet' and 'water' can easily be 'fire' and 'burning'. The chance that, when they arrived at the place [L——], her father had expressed his anxiety at the risk of fire [p. 58] helped to decide that the danger from which her father was to rescue her should be a fire. The situation chosen for the dream picture was based upon this chance, and upon the opposition to 'wet': 'There was a fire. Her father was standing beside her bed to wake her.' Her father's chance utterance would, no doubt, not have obtained such an important position in the dream if it had not fitted in so excellently with the dominating current of feeling, which was determined to regard him at any cost as a protector and saviour. 'He foresaw the danger from the very moment of our arrival! He was in the right!' (In actual fact, it was he who had brought the girl into [90]
danger.)

In consequence of certain connections which can easily be made from it, the word 'wet' served in the dream thoughts as a nodal point between several groups of ideas. 'Wet' was connected not only with the

bedwetting, but also with the group of ideas relating to sexual temptation which lay suppressed behind the content of the dream. Dora knew that there was a kind of getting wet involved in sexual intercourse, and that during the act of copulation the man presented the woman with something liquid *in the form of drops*. She also knew that the danger lay precisely in that, and that it was her business to protect her genitals from being moistened.

'Wet' and 'drops' at the same time opened the way to the other group of associations – the group relating to the disgusting catarrh, which in her later years had no doubt possessed the same mortifying significance for her as the bedwetting had in her childhood. 'Wet' in this connection had the same meaning as 'dirtied'. Her genitals, which ought to have been kept clean, had been dirtied already by the catarrh – and this applied to her mother no less than to herself (p. 67). She seemed to understand that her mother's mania for cleanliness was a reaction against this dirtying.

The two groups of ideas met in this one thought: 'Mother got both things from my father: the sexual wetness and the dirtying discharge.' Dora's jealousy of her mother was inseparable from the group of thoughts relating to her infantile love for her father which she summoned up for her protection. But this material was not yet capable of representation. If, however, a recollection could be found which was equally closely connected with both the groups related to the word 'wet', but which avoided any offensiveness, then such a recollection would be able to take over the representation in the dream of the material in question.

A recollection of this sort was furnished by the episode of the 'drops' – the jewellery ['*Schmuck*'] that Dora's mother wanted to have [p. 61 above]. In appearance the connection between this reminiscence and the two groups of thoughts relating to sexual wetness and to being dirtied was a purely external and superficial one, of a verbal character. For 'drops' was used ambiguously as a 'switch-word' [p. 58 *n.* 2], while
[91] 'jewellery' ['*Schmuck*'] was taken as an equivalent to 'clean', and thus as a rather forced contrary of 'dirtied'.[1] But in reality the most substantial connections can be shown to have existed between the things denoted themselves. The recollection originated from the material connected

1 [The German word '*Schmuck*' has a much wider meaning than the English 'jewellery', though that is the sense in which it occurs in the compound '*Schmuckkästchen*', 'jewel case'. As a substantive, '*Schmuck*' denotes 'finery' of all kinds, not only personal adornments, but embellishments of objects and decorations in general. In an adjectival sense, it can mean 'smart', 'tidy' or 'neat'.]

with Dora's jealousy of her mother, which, though its roots were infantile, had persisted far beyond that period. By means of these two verbal bridges it was possible to transfer on to the single reminiscence of the 'jewel drops' the whole of the significance attaching to the ideas of her parents' sexual intercourse, and of her mother's gonorrhoea and tormenting passion for cleanliness.

But a still further displacement had to be effected before this material appeared in the dream. Though 'drops' is nearer to the original 'wet', it was the more distant 'jewellery' that found a place in the dream. When, therefore, this element had been inserted into the dream situation which had already been established, the account might have run: 'Mother wanted to stop and save her jewellery.' But a subsequent [*nachträglich*] influence now made itself felt, and led to the further alteration of 'jewellery' into 'jewel case'. This influence came from elements in the underlying group relating to the temptation offered by Herr K. He had never given her jewellery, but he had given her a 'case' for it [p. 61 above], which meant for her all the marks of preference and all the tenderness for which she felt she ought now to have been grateful. And the composite word thus formed, 'jewel case', had beyond this a special claim to be used as a representative element in the dream. Is not 'jewel case' ['*Schmuckkästchen*'] a term commonly used to describe female genitals that are immaculate and intact? And is it not, on the other hand, an innocent word? Is it not, in short, admirably calculated both to betray and to conceal the sexual thoughts that lie behind the dream?

'Mother's jewel case' was therefore introduced in two places in the dream; and this element replaced all mention of Dora's infantile jealousy, of the drops (that is, of the sexual wetness), of being dirtied by the [92]
discharge, and, on the other hand, of her present thoughts connected with the temptation – the thoughts which were urging her to reciprocate the man's love, and which depicted the sexual situation (alike desirable and menacing) that lay before her. The element of 'jewel case' was more than any other a product of condensation and displacement, and a compromise between contrary mental currents. The multiplicity of its origin – both from infantile and contemporary sources – is no doubt pointed to by its double appearance in the content of the dream.

The dream was a reaction to a fresh experience of an exciting nature; and this experience must inevitably have revived the memory of the only previous experience which was at all analogous to it. The latter was the scene of the kiss in Herr K.'s place of business, when she had been seized with disgust [p. 26]. But this same scene was associatively

accessible from other directions too, namely, from the group of thoughts relating to the catarrh (p. 73 f.), and from her present temptation. The scene therefore brought to the dream a contribution of its own, which had to be made to fit in with the dream situation that had already been laid down: 'There was a fire' . . . no doubt the kiss smelt of smoke; so she smelt smoke in the dream, and the smell persisted till after she was awake [p. 65 above].

By inadvertence, I unfortunately left a gap in the analysis of the dream. Dora's father was made to say, 'I refuse to let my two children go to their destruction . . .' ('as a result of masturbation' should no doubt be added from the dream thoughts). Such speeches in dreams are regularly constructed out of pieces of actual speeches which have either been made or heard.[1] I ought to have made enquiries as to the actual source of this speech. The results of my enquiry would no doubt have shown that the structure of the dream was still more complicated, but would at the same time have made it easier to penetrate.

Are we to suppose that when this dream occurred at L—— it had precisely the same content as when it recurred during the treatment? It does not seem necessary to do so. Experience shows that people often assert that they have had the same dream, when as a matter of fact the separate appearances of the recurrent dream have differed from one
[93] another in numerous details and in other respects that were of no small importance. Thus one of my patients told me that she had had her favourite dream again the night before, and that it always recurred in the same form: she had dreamt of swimming in the blue sea, of joyfully cleaving her way through the waves, and so on. On closer investigation it turned out that upon a common background now one detail and now another was brought out; on one occasion, even, she was swimming in a frozen sea and was surrounded by icebergs. This patient had other dreams, which turned out to be closely connected with the recurrent one, though even she made no attempt to claim that they were identical to it. Once, for instance, she was looking at a view of Heligoland (based on a photograph, but life-size) which showed the upper and lower parts of the island simultaneously; on the sea was a ship, in which were two people whom she had known in her youth, and so on.

What is certain is that in Dora's case the dream which occurred during the treatment had gained a new significance connected with the present time, though perhaps its manifest content had not changed. The dream thoughts behind it included a reference to my treatment, and it

1 [Cf. *The Interpretation of Dreams* (1900*a*), Chapter VI, Section F; *RSE*, **5**, 374 ff.]

corresponded to a renewal of the old intention of withdrawing from a danger. If her memory was not deceiving her when she declared that even at L—— she had noticed the smoke after she woke up, it must be acknowledged that she had brought my proverb 'There can be no smoke without fire' [p. 65 above] very ingeniously into the completed form of the dream, in which it seemed to serve as an overdetermination of the last element. It was undeniably a mere matter of chance that the most recent exciting cause – her mother's locking the dining-room door so that her brother was shut into his bedroom [p. 58] – had provided a connection with her persecution by Herr K. at L——, where her decision had been made when she found she could not lock her bedroom door. It is possible that her brother did not appear in the dream on the earlier occasions, so that the words 'my two children' did not form part of its content until after the occurrence of its latest exciting cause.

III
THE SECOND DREAM

[94] A few weeks after the first dream the second occurred, and when it had been dealt with the analysis was broken off. It cannot be made as completely intelligible as the first, but it afforded a desirable confirmation[t] of an assumption which had become necessary about the patient's mental state [p. 92 f. below], it filled in a gap in her memory [p. 93], and it made it possible to obtain a deep insight into the origin of another of her symptoms [p. 90].

Dora described the dream as follows: '*I was walking about in a town which I did not know. I saw streets and squares which were strange to me.*[1] *Then I came into a house where I lived, went to my room, and found a letter from Mother lying there. She wrote saying that as I had left home without my parents' knowledge she had not wished to write to me to say that Father was ill. "Now he is dead, and if you like*[2] *you can come." I then went to the station* ["Bahnhof"] *and asked about a hundred times: "Where is the station?" I always got the answer: "Five minutes." I then saw a thick wood before me which I went into, and there I asked a man whom I met. He said to me: "Two and a half hours more."*[3] *He offered to accompany me. But I refused and went alone. I saw the station in front of me and could not reach it. At the same time I had the usual feeling of anxiety that one has in dreams when one cannot move forward. Then I was at home. I must have been travelling in the meantime, but I know nothing about that. I walked into the porter's lodge, and enquired for our flat. The maidservant opened the door to me and replied that Mother and the others were already at the cemetery* ["Friedhof"].'[4]

1 To this she subsequently made an important addendum [*Nachtrag*]: '*I saw a monument in one of the squares.*'

2 To this came the addendum: '*There was a question mark after this word, thus: "like?"*.'

3 In repeating the dream she said: '*Two hours*.' [In the 1921 German edition only, this is misprinted 'Three hours'.]

4 In the next session Dora brought me two addenda to this: '*I saw myself particularly distinctly going up the stairs*,' and '*After she had answered I went to my room, but not the least sadly, and began reading a big book that lay on my writing table*.'

It was not without some difficulty that the interpretation of this dream proceeded. In consequence of the peculiar circumstances in which the analysis was broken off – circumstances connected with the content of the dream – the whole of it was not cleared up. And for this reason, too, I am not equally certain at every point of the order in which my conclusions were reached. I will begin by mentioning the subject matter with which the current analysis was dealing at the time when the dream intervened. For some time Dora herself had been raising a number of questions about the connection between some of her actions and the motives which presumably underlay them. One of these questions was: 'Why did I say nothing about the scene by the lake for some days after it had happened?' Her second question was: 'Why did I then suddenly tell my parents about it?' Moreover, her having felt so deeply injured by Herr K.'s proposition seemed to me in general to need explanation, especially as I was beginning to realize that Herr K. himself had not regarded his proposition to Dora as a mere frivolous attempt at seduction. I looked upon her having told her parents of the episode as an action which she had taken when she was already under the influence of a morbid craving for revenge. A normal girl, I am inclined to think, will deal with a situation of this kind by herself. [95]

I shall present the material produced during the analysis of this dream in the somewhat haphazard order in which it recurs to my mind.

She was wandering about alone in a strange town, and saw streets and squares. Dora assured me that it was certainly not B——, which I had first hit upon, but a town in which she had never been. It was natural to suggest that she might have seen some pictures or photographs and have taken the dream pictures from them. After this remark of mine came the addendum about the monument in one of the squares and immediately afterwards her recognition of its source. At Christmas[1] she had been sent an album from a German health resort, containing views of the town; and the very day before the dream she had sought this out to show it to some relatives who were stopping with them. It had been put in a box for keeping pictures in, and she could not lay her hands on it at once. She had therefore said to her mother: '*Where is the box?*'[2] One of the pictures was of a square with a monument in it. The present had been sent to her by a young engineer, with whom she had once had a passing [96]

1 [The dream occurred a few days after Christmas (see p. 93 below).]

2 In the dream she said: '*Where is the station?*' The resemblance between the two questions led me to make an inference which I shall go into presently [p. 86].

acquaintance in the manufacturing town. The young man had accepted a post in Germany, so as to become sooner self-supporting; and he took every opportunity of reminding Dora of his existence. It was easy to guess that he intended to come forward as a suitor one day, when his position had improved. But that would take time, and it meant waiting.

The wandering about in a strange town was overdetermined. It led back to one of the exciting causes from the day before. A young cousin of Dora's had come to stay with them for the holidays, and Dora had had to show him round Vienna. This cause was, it is true, a matter of complete indifference to her. But her cousin's visit reminded her of her own first brief visit to Dresden. On that occasion she had been a stranger and had wandered about, not failing, of course, to visit the famous picture gallery. Another [male] cousin of hers, who was with them and knew Dresden, had wanted to act as a guide and take her round the gallery. *But she declined and went alone*, and stopped in front of the pictures that appealed to her. She remained *two hours* in front of the Sistine Madonna, rapt in silent admiration. When I asked her what had pleased her so much about the picture she could find no clear answer to make. At last she said: 'The Madonna.'

There could be no doubt that these associations really belonged to the material concerned in forming the dream. They included portions which reappeared in the dream unchanged ('she declined and went alone' and 'two hours'). I may remark at once that 'pictures' was a nodal point in the network of her dream thoughts (the pictures in the album, the pictures at Dresden). I should also like to single out, with a view to subsequent investigation, the theme of the 'Madonna', of the virgin mother. But what was most evident was that in this first part of the dream she was identifying herself with a young man. This young man was wandering about in a strange place, he was striving to reach a goal, but he was being kept back, he needed patience and must wait. If in all this she
[97] had been thinking of the engineer, it would have been appropriate for the goal to have been the possession of a woman, of herself. But instead of this it was – a station. Nevertheless, the relation of the question in the dream to the question which had been put in real life allows us to substitute '*box*' for 'station'.[1] A box and a woman: the notions begin to agree better.

She asked quite a hundred times. . . . This led to another exciting cause of the dream, and this time to one that was less indifferent. On the

1 ['*Schachtel*', the word which was used for 'box' by 'Dora' in her question, is a depreciatory term for 'woman'.]

previous evening they had had company, and afterwards her father had asked her to fetch him the brandy: he could not get to sleep unless he had taken some brandy. She had asked her mother for the key to the sideboard; but the latter had been deep in conversation, and had not answered her, until Dora had exclaimed with the exaggeration of impatience: 'I've asked you *a hundred times* already where the key is.' As a matter of fact, she had of course only repeated the question about *five times*.[1]

'Where is the *key*?' seems to me to be the masculine counterpart to the question 'Where is the *box*?'[2] They are therefore questions referring to – the genitals.

Dora went on to say that during this same family gathering someone had toasted her father and had expressed the hope that he might continue to enjoy the best of health for many years to come, etc. At this a strange quiver passed over her father's tired face, and she had understood what thoughts he was having to keep down. Poor sick man! who could tell what span of life was still to be his?

This brings us to the *contents of the letter* in the dream. Her father was dead, and she had left home by her own choice. In connection with this letter I at once reminded Dora of the farewell letter which she had written to her parents or had at least composed for their benefit [p. 22 above]. This letter had been intended to give her father a fright, so that he should give up Frau K.; or at any rate to take revenge on him if he [98]
could not be induced to do that. We are here concerned with the subject of her death and of her father's death. (Cf. 'cemetery' later on in the dream.) Shall we be going astray if we suppose that the situation which formed the façade of the dream was a phantasy of revenge directed against her father? The feelings of pity for him which she remembered from the day before would be quite in keeping with this. According to the phantasy she had left home and gone among strangers, and her father's heart had broken with grief and with longing for her. Thus she would be revenged. She understood very clearly what it was that her father needed when he could not get to sleep without a drink of brandy.[3]

1 In the dream the number five occurs in the mention of the period of 'five minutes'. In my book on the interpretation of dreams I have given several examples of the way in which numbers occurring in the dream thoughts are treated by dreams. We frequently find them torn out of their true context and inserted into a new one. [See Freud, 1900*a*, Section F of Chapter VI; *RSE*, **5**, 370 ff.]

2 See the first dream, p. 59.

3 There can be no doubt that sexual satisfaction is the best soporific, just as sleeplessness is almost always the consequence of lack of satisfaction. Her father could not sleep because he was debarred from sexual intercourse with the woman he loved. (Compare in this connection the phrase discussed just below: 'I get nothing out of my wife.') [Cf. also the words quoted from 'Dora's' father on p. 25 above.]

We will make a note of Dora's *craving for revenge* as a new element to be taken into account in any subsequent synthesis of her dream thoughts.

But the contents of the letter must be capable of further determination. What was the source of the words 'if you like'? It was at this point that the addendum of there having been a question mark after the word 'like' occurred to Dora, and she then recognized these words as a quotation out of the letter from Frau K. which had contained the invitation to L——, the place by the lake. In that letter there had been a question mark placed, in a most unusual fashion, in the very middle of a sentence, after the intercalated words 'if you would like to come'.

So here we were back again at the scene by the lake [p. 24 above] and at the problems connected with it. I asked Dora to describe the scene to me in detail. At first she produced little that was new. Herr K.'s exordium had been somewhat serious; but she had not let him finish what he had to say. No sooner had she grasped the purport of his words than she had slapped him in the face and hurried away. I enquired what his actual words had been. Dora could remember only one of his pleas: 'You know I get nothing out of my wife.'[1] In order to avoid meeting him again she
[99] had wanted to get back to L—— on foot, by walking round the lake, and *she had asked a man whom she met how far it was*. On his replying that it was '*Two and a half hours*', she had given up her intention and had after all gone back to the boat, which left soon afterwards. Herr K. had been there too and had come up to her and begged her to forgive him and not to mention the incident. But she had made no reply. – Yes. The *wood* in the dream had been just like the wood by the shore of the lake, the wood in which the scene she had just described once more had taken place. But she had seen precisely the same thick wood the day before, in a picture at the Secessionist exhibition. In the background of the picture there were *nymphs*.[2]

At this point a certain suspicion of mine became a certainty. The use of '*Bahnhof*' ['station', literally 'railway court'][3] and '*Friedhof*' ['cemetery', literally 'peace court'] to represent the female genitals was striking enough in itself, but it also served to direct my awakened curiosity to the similarly formed '*Vorhof*' ['vestibulum', literally 'forecourt'] – an

1 These words will enable us to solve one of our problems [p. 94 below].

2 Here for the third time we come upon 'picture' (views of towns, the Dresden gallery), but in a much more significant connection. Because of what appears in the picture (the wood, the nymphs), the '*Bild*' ['picture'] is turned into a '*Weibsbild*' [literally 'picture of a woman' – a somewhat derogatory expression for 'woman'].

3 Moreover, a 'station' is used for purposes of '*Verkehr*' ['traffic', 'intercourse', 'sexual intercourse']: this fact determines the psychical coating in a number of cases of railway phobia.

anatomical term for a particular region of the female genitals. This might have been no more than mistaken ingenuity. But now, with the addition of 'nymphs' visible in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae',[1] as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of the 'thick wood' of the pubic hair. But anyone who employed such technical names as 'vestibulum' and 'nymphae' must have derived his knowledge from books, and not from popular ones either, but from anatomical textbooks or from an encyclopaedia – the common refuge of youth when it is devoured by sexual curiosity. If this interpretation were correct, therefore, there lay concealed behind the first situation in the dream a phantasy of defloration, the phantasy of a man seeking to force an entrance into the female genitals.[2] [100]

I informed Dora of the conclusions I had reached. The impression made upon her must have been forcible, for there immediately appeared a piece of the dream which had been forgotten: '*she went calmly to her room, and began reading a big book that lay on her writing table*.'[3] The emphasis here was upon the two details 'calmly' and 'big' in connection with 'book'. I asked whether the book was in encyclopaedia *format*, and she said it was. Now children never read about forbidden subjects in an encyclopaedia *calmly*. They do it in fear and trembling, with an uneasy look over their shoulder to see if someone may not be coming. Parents are very much in the way while reading of this kind is going on. But this uncomfortable situation had been radically improved, thanks to the dream's power of fulfilling wishes. Dora's father was dead, and the

1 [In German the same word, '*Nymphen*', represents both 'nymphs' and 'nymphae'.]

2 The phantasy of defloration formed the second component of the situation. The emphasis upon the difficulty of getting forward and the anxiety felt in the dream indicated the stress which the dreamer was so ready to lay upon her virginity – a point alluded to in another place by means of the Sistine Madonna. These sexual thoughts gave an unconscious ground colouring to the wishes (which were perhaps merely kept secret) concerned with the suitor who was waiting for her in Germany. We have already [p. 87 f. above] recognized the phantasy of revenge as the first component of the same situation in the dream. The two components do not coincide completely, but only in part. We shall subsequently come upon the traces of a third and still more important train of thought. [See p. 96 *n*. 1 below.]

3 On another occasion, instead of 'calmly' she said 'not the least sadly' (p. 84 *n*. 4). – I can quote this dream as fresh evidence for the correctness of an assertion made in my *Interpretation of Dreams* (Chapter VII, Section A; *RSE*, **5**, 463) [see also p. 65 above] to the effect that those pieces of a dream which are at first forgotten and are only subsequently [*nachträglich*] remembered are invariably the most important from the point of view of understanding the dream. In the same place I went on to the conclusion that the forgetting of dreams must also be explained as an effect of endopsychic resistance. – [The first sentence of this footnote was added in 1924.]

others had already gone to the cemetery. She might calmly read whatever she chose. Did not this mean that one of her motives for revenge was a revolt against her parents' constraint? If her father was dead she could read or love as she pleased.

At first she would not remember ever having read anything in an
[101] encyclopaedia; but she then admitted that a recollection of an occasion of the kind did occur to her, though it was of an innocent enough nature. At the time when the aunt she was so fond of had been so seriously ill and it had already been settled that Dora was to go to Vienna, a *letter* had come from another uncle, to say that they could not go to Vienna, as a boy of his, a cousin of Dora's therefore, had fallen dangerously ill with appendicitis. Dora had thereupon looked up in the encyclopaedia to see what the symptoms of appendicitis were. From what she had then read she still recollected the characteristic localization of the abdominal pain.

I then remembered that shortly after her aunt's death Dora had had an attack of what had been alleged to be appendicitis [p. 21 above]. Up till then I had not ventured to count that illness among her hysterical productions. She told me that during the first few days she had had high fever and had felt the pain in her abdomen that she had read about in the encyclopaedia. She had been given cold fomentations but had not been able to bear them. On the second day her period had set in, accompanied by violent pains. (Since her health had been bad, the periods had been very irregular.) At that time she used to suffer continually from constipation.

It was not really possible to regard this state as a purely hysterical one. Although hysterical fever does undoubtedly occur, yet it seemed too arbitrary to put down the fever accompanying this questionable illness to hysteria instead of to some organic cause operative at the time. I was on the point of abandoning the track, when she herself helped me along it by producing her last addendum to the dream: *she saw herself particularly distinctly going up the stairs.*

I naturally required a special determinant for this. Dora objected that she would anyhow have had to go upstairs if she had wanted to get to her flat, which was on an upper floor. It was easy to brush aside this objection (which was probably not very seriously intended) by pointing out that if she had been able to travel in her dream from the unknown town to Vienna without making a railway journey she ought also to have been able to leave out a flight of stairs. She then proceeded to relate that after the appendicitis she had not been able to walk properly and had dragged her right foot. This state of things had continued for a long time,

and on that account she had been particularly glad to avoid stairs. Even now her foot sometimes dragged. The doctors whom she had consulted [102] at her father's desire had been very much astonished at this most unusual after-effect of an appendicitis, especially as the abdominal pains had not recurred and did not in any way accompany the dragging of the foot.[1]

Here, then, we have a true hysterical symptom. The fever may have been organically determined – perhaps by one of those very frequent attacks of influenza that are not localized in any particular part of the body. Nevertheless, it was now established that the neurosis had seized upon this chance event and made use of it for an utterance of its own. Dora had therefore given herself an illness which she had read up about in the encyclopaedia, and she had punished herself for dipping into its pages. But she was forced to recognize that the punishment could not possibly apply to her reading the innocent article in question. It must have been inflicted as the result of a process of displacement, after another occasion of more guilty reading had become associated with this one; and the guilty occasion must lie concealed in her memory behind the contemporaneous innocent one.[2] It might still be possible, perhaps, to discover the nature of the subjects she had read about on that other occasion.

What, then, was the meaning of this condition, of this attempted simulation of a perityphlitis? The remainder of the disorder, the dragging of one leg, was entirely out of keeping with perityphlitis. It must, no doubt, fit in better with the secret and possibly sexual meaning of the clinical picture; and if it were elucidated might in its turn throw light on the meaning which we were in search of. I looked about for a method of approaching the puzzle. Periods of time had been mentioned in the dream; and time is assuredly never a matter of indifference in any bio- [103] logical event. I therefore asked Dora when this attack of appendicitis had taken place; whether it had been before or after the scene by the lake. Every difficulty was resolved at a single blow by her prompt reply: 'Nine months later.' The period of time is sufficiently characteristic. Her supposed attack of appendicitis had thus enabled the patient with the

1 We must assume the existence of some somatic connection between the painful abdominal sensations known as 'ovarian neuralgia' and locomotor disturbances in the leg on the same side; and we must suppose that in Dora's case the somatic connection had been given an interpretation of a particularly specialized sort, that is to say, that it had been overlaid with and brought into the service of a particular psychological meaning. The reader is referred to my analogous remarks in connection with the analysis of Dora's symptom of coughing and with the relation between catarrh and loss of appetite [p. 73 f. above].

2 This is quite a typical example of the way in which symptoms arise from exciting causes which appear to be entirely unconnected with sexuality.

modest means at her disposal (the pains and the menstrual flow) to realize a phantasy of *childbirth*.[1] Dora was naturally aware of the significance of this period of time, and could not dispute the probability of her having, on the occasion under discussion, read up in the encyclopaedia about pregnancy and childbirth. But what was all this about her dragging her leg? I could now hazard a guess. That is how people walk when they have twisted a foot. So she had made a 'false step': which was true indeed if she could give birth to a child nine months after the scene by the lake. But there was still another requirement upon the fulfilment of which I had to insist. I am convinced that a symptom of this kind can only arise where it has an *infantile* prototype. All my experience hitherto has led me to hold firmly to the view that recollections derived from the impressions of later years do not possess sufficient force to enable them to establish themselves as symptoms. I scarcely dared hope that Dora would provide me with the material that I wanted from her childhood, for the fact is that I am not yet in a position to assert the general validity of this rule, much as I should like to be able to do so. But in this case there came an immediate confirmation of it. Yes, said Dora, once when she was a child she had twisted the same foot; she had slipped on one of the steps as she was going *downstairs* at B——. The foot – and it was actually the same one that she afterwards dragged – had swelled up and had to be bandaged and she had had to lie up for some weeks. This had been a short time before the attack of nervous asthma in her eighth year [p. 20 above].

The next thing to do was to turn to account our knowledge of the existence of this phantasy: 'If it is true that you were delivered of a child nine months after the scene by the lake, and that you are going about to
[104] this very day carrying the consequences of your false step with you, then it follows that in your unconscious you must have regretted the upshot of the scene. In your unconscious thoughts, that is to say, you have made an emendation in it. The assumption that underlies your phantasy of childbirth is that on that occasion something took place,[2] that on that occasion you experienced and went through everything that you were in fact obliged to pick up later on from the encyclopaedia. So you see that your love for Herr K. did not come to an end with the scene, but that (as

1 I have already indicated [p. 42 f. above] that the majority of hysterical symptoms, when they have attained their full pitch of development, represent an imagined situation of sexual life – such as a scene of sexual intercourse, pregnancy, childbirth, confinement, etc.

2 The phantasy of defloration [p. 89 above] is thus found to have an application to Herr K., and we begin to see why this part of the dream contained material taken from the scene by the lake – the refusal, two and a half hours, the wood, the invitation to L——.

I maintained) it has persisted down to the present day – though it is true that you are unconscious of it.' – And Dora disputed the fact no longer.[1]

The labour of elucidating the second dream had so far occupied two hours. At the end of the second session, when I expressed my satisfaction at the result, Dora replied in a depreciatory tone: 'Why, has anything so very remarkable come out?' These words prepared me for the advent of fresh revelations. [105]

She opened the third session with these words: 'Do you know that I am here for the last time today?' – 'How can I know, as you have said nothing to me about it?' – 'Yes. I made up my mind to put up with it till the New Year.[2] But I shall wait no longer than that to be cured.' – 'You know that you are free to stop the treatment at any time. But for today we will go on with our work. When did you come to this decision?' – 'A fortnight ago, I think.' – 'That sounds just like a maidservant or a governess – a fortnight's notice.' – 'There was a governess who gave notice with

1 I may here add a few supplementary interpretations to those that have already been given: The '*Madonna*' was obviously Dora herself; in the first place because of the 'adorer' who had sent her the pictures [p. 85 f. above], in the second place because she had won Herr K.'s love chiefly by the motherliness she had shown towards his children [p. 24], and lastly because she had had a child though she was still a girl (this being a direct allusion to the phantasy of childbirth). Moreover, the notion of the 'Madonna' is a favourite counter-idea in the mind of girls who feel themselves oppressed by imputations of sexual guilt – which was the case with Dora. A first suspicion of this connection came to me while I was working as a physician at the Psychiatric Clinic of the University. I there came across a case of confusional insanity with hallucinations, in which the attack, which ran a rapid course, turned out to be a reaction to a reproach made against the patient by her fiancé. – If the analysis had been continued, Dora's maternal longing for a child would probably have been revealed as an obscure though powerful motive in her behaviour. – The numerous questions which she had been raising latterly seem to have been belated derivatives of questions inspired by the sexual curiosity which she had tried to gratify with the encyclopaedia. The subjects which she read up in it were presumably pregnancy, childbirth, virginity, and so on. – In reproducing the dream Dora had forgotten one of the questions which need to be inserted into the course of the second situation in the dream. This question could only be: 'Does Herr —— live here?' or 'Where does Herr —— live?' There must have been some reason for her having forgotten this apparently innocent question, especially as she need not have brought it into the dream at all. This reason, it seems to me, lay in her surname itself, which also denoted something and in fact more than one kind of thing, and which could therefore be regarded as an 'ambiguous' word. Unluckily I cannot give the name and show how well designed it was to indicate something 'ambiguous' and 'improper'. This interpretation was supported by the discovery of a similar play upon words in another part of the dream, where the material was derived from Dora's recollections of her aunt's death ('they have already gone to the cemetery' [*Friedhof*]) and where there was similarly a play upon her aunt's *name*. These improper words seemed to point to a second and *oral* source of information, since the encyclopaedia would not cover them. I should not have been surprised to hear that this source had been Frau K. herself, Dora's calumniator. [Cf. p. 56.] In that case she would have been the one person whom Dora generously spared, while she pursued the others with an almost malignant vindictiveness. Behind the almost limitless series of displacements which were thus brought to light, it was possible to divine the operation of a single simple factor – Dora's deep-rooted homosexual love for Frau K. [Cf. pp. 54 ff. and 106 *n*.]

2 It was December 31.

the K.s, when I was on my visit to them that time at L——, by the lake.' – 'Really? You have never told me about her. Tell me.'

'Well, there was a young girl in the house, who was the children's governess; and she behaved in the most extraordinary way to Herr K. She never said good morning to him, never answered his remarks, never handed him anything at table when he asked for it, and in short treated him like thin air. For that matter he was hardly any politer to her. A day or two before the scene by the lake, the girl took me aside and said she had something to tell me. She then told me that Herr K. had made advances to her at a time when his wife was away for several weeks; he
[106] had ardently propositioned[t] her and had implored her to yield to his entreaties, saying that he got nothing from his wife, and so on.' – 'Why, those are the very words he used afterwards, when he made his proposition to you and you gave him the slap in his face' [p. 88 above]. – 'Yes. She had given way to him, but after a little while he had ceased to care for her, and since then she hated him.' – 'And this governess had given notice?' – 'No. She meant to give notice. She told me that as soon as she felt she was thrown over she had told her parents what had happened. They were respectable people living in Germany somewhere. Her parents said that she must leave the house instantly; and, as she failed to do so, they wrote to her saying that they would have nothing more to do with her, and that she was never to come home again.' – 'And why had she not gone away?' – 'She said she meant to wait a little longer, to see if there might not be some change in Herr K. She could not bear living like that any more, she said, and if she saw no change she should give notice and go away.' – 'And what became of the girl?' – 'I only know that she went away.' – 'And she did not have a child as a result of the adventure?' – 'No.'

Here, therefore (and quite in accordance with the rules), was a piece of material information coming to light in the middle of the analysis and helping to solve problems which had previously been raised. I was able to say to Dora: 'Now I know your motive for the slap in the face with which you answered Herr K.'s proposition. It was not that you were offended at his suggestions [*Zumutung*][t]; you were actuated by jealousy and revenge. At the time when the governess was telling you her story you were still able to make use of your gift for putting on one side everything that is not agreeable to your feelings. But at the moment when Herr K. used the words "I get nothing out of my wife"[t] – which were the same words he had used to the governess – fresh emotions were aroused in you and tipped the balance. "Does he dare", you said to

yourself, "to treat me like a governess, like a servant?" Wounded pride added to jealousy and to the conscious motives of common sense – it was too much.[1] To prove to you how deeply impressed you were by the governess's story, let me draw your attention to the repeated occasions upon which you have identified yourself with her both in your dream and in [107] your conduct. You told your parents what happened – a fact which we have hitherto been unable to account for – just as the governess wrote and told *her* parents. You give me a fortnight's notice, just like a governess. The letter in the dream which gave you leave to go home is the counterpart of the governess's letter from her parents forbidding her to do so.'

'Then why did I not tell my parents at once?'

'How much time did you allow to elapse?'

'The scene took place on the last day of June; I told my mother about it on July 14th.'

'Again a fortnight, then – the time characteristic for a person in service. Now I can answer your question. You understood the poor girl very well. She did not want to go away at once, because she still had hopes, because she expected that Herr K.'s affections would return to her again. So that must have been your motive too. You waited for that length of time so as to see whether he would repeat his propositions; if he had, you would have concluded that he was in earnest, and did not mean to play with you as he had done with the governess.'

'A few days after I had left he sent me a picture postcard.'[2]

'Yes, but when after that nothing more came, you gave free rein to your feelings of revenge. I can even imagine that at that time you were still able to find room for a subsidiary intention, and thought that your accusation might be a means of inducing him to travel to the place where you were living.' – 'As he actually offered to do at first,' Dora threw in. – 'In that way your longing for him would have been appeased' – here she nodded assent, a thing which I had not expected – 'and he might have made you the amends you desired.'

'What amends?'

'The fact is, I am beginning to suspect that you took the affair with Herr K. much more seriously than you have been willing to admit so far. Had not the K.s often talked of getting a divorce?'

1 It is not a matter of indifference, perhaps, that Dora may have heard her father make the same complaint about his wife, just as I myself did from his own lips [p. 25 above]. She was perfectly well aware of its meaning.

2 Here is the point of contact with the engineer [p. 85 f. above], who was concealed behind the figure of Dora herself in the first situation in the dream.

'Yes, certainly. At first she did not want to, on account of the children. And now she wants to, but he no longer does.'

[108] 'May you not have thought that he wanted to get divorced from his wife so as to marry you? And that now he no longer wants to because he has no-one to replace her? It is true that two years ago you were very young. But you told me yourself that your mother was engaged at seventeen and then waited two years for her husband. A daughter usually takes her mother's love story as her model. So you too wanted to wait for him, and you took it that he was only waiting till you were grown up enough to be his wife.[1] I imagine that this was a perfectly serious plan for the future in your eyes. You have not even got the right to assert that it was out of the question for Herr K. to have had any such intention; you have told me enough about him that points directly towards his having such an intention.[2] Nor does his behaviour at L—— contradict this view. After all, you did not let him finish his speech and do not know what he meant to say to you. Incidentally, the scheme would by no means have been so impracticable. Your father's relations with Frau K. – and it was probably only for this reason that you lent them your support for so long – made it certain that her consent to a divorce could be obtained; and you can get anything you like out of your father. Indeed, if your temptation at L—— had had a different upshot, this would have been the only possible solution for all the parties concerned. And I think that is why you regretted the actual event so deeply and emended it in the phantasy which made its appearance in the shape of the appendicitis. So it must have been a bitter piece of disillusionment for you when the effect of your charges against Herr K. was not that he renewed his propositions but that he replied instead with denials and slanders. You will agree that nothing makes you so angry as having it thought that you merely fancied the scene by the lake. [Cf. p. 42 above.] I know now – and this is what you do not want to be reminded of – that you *did* fancy that Herr K.'s propositions were serious, and that he would not leave off until you had married him.'

[109] Dora had listened to me without any of her usual contradictions. She seemed to be moved; she said goodbye to me very warmly, with the heartiest wishes for the New Year, and – came no more. Her father, who

1 The theme of waiting till the goal is reached occurs in the content of the first situation in the dream. I recognize in this phantasy of waiting for a fiancée a portion of the third component of that situation. I have already alluded [p. 89 *n.* 2 above] to the existence of this third component.

2 In particular, there was a speech which he had made in presenting Dora with a letter case for Christmas in the last year in which they lived together at B——.

called on me two or three times afterwards, assured me that she would come back again, and said it was easy to see that she was eager for the treatment to continue. But it must be confessed[t] that Dora's father was never entirely straightforward. He had given his support to the treatment so long as he could hope that I should 'talk' Dora out of her belief that there was something more than a friendship between him and Frau K. His interest faded when he observed that it was not my intention to bring about that result. I knew Dora would not come back again. Her breaking off so unexpectedly, just when my hopes of a successful termination of the treatment were at their highest, and her thus bringing those hopes to nothing – this was an unmistakable act of vengeance on her part. Her purpose of self-injury also profited by this action. No-one who, like me, conjures up the most evil of those half-tamed demons that inhabit the human breast, and seeks to wrestle with them, can expect to come through the struggle unscathed. Might I perhaps have kept the girl under my treatment if I myself had acted a part, if I had exaggerated the importance to me of her staying on, and had shown a warm personal interest in her – a course which, even after allowing for my position as her physician, would have been tantamount to providing her with a substitute for the affection she longed for? I do not know. Since in every case a portion of the factors that are encountered under the form of resistance remains unknown, I have always avoided acting a part, and have contented myself with practising the humbler arts of psychology. In spite of every theoretical interest and of every endeavour to be of assistance as a physician, I keep the fact in mind that there must be some limits set to the extent to which psychological influence may be used, and I respect as one of these limits the patient's own will and understanding.

Nor do I know whether Herr K. would have done any better if it had been revealed to him that the slap Dora gave him by no means signified a final 'No' on her part, but that it expressed the jealousy which had lately been roused in her, while her strongest feelings were still on his side. If he had disregarded that first 'No', and had continued to press his suit with a passion which left room for no doubts, the result might very well have been a triumph of the girl's affection for him over all her internal [110] difficulties. But I think she might just as well have been merely provoked into satisfying her craving for revenge upon him all the more thoroughly. It is never possible to calculate towards which side the decision will incline in such a conflict of motives: whether towards the removal of the repression or towards its reinforcement. Incapacity for meeting a *real*

erotic demand is one of the most essential features of a neurosis. Neurotics are dominated by the opposition between reality and phantasy. If what they long for the most intensely in their phantasies is presented to them in reality, they nonetheless flee from it; and they abandon themselves to their phantasies the most readily where they need no longer fear to see them realized. Nevertheless, the barrier erected by repression can fall before the onslaught of a violent emotional excitement produced by a real cause; it is possible for a neurosis to be overcome by reality. But we have no general means of calculating through what person or what event such a cure can be effected.[1]

1 I will add a few remarks on the structure [*Aufbau*] of this dream, though it is not possible to understand it thoroughly enough to allow of a synthesis being attempted. A prominent piece of the dream is to be seen in the phantasy of revenge against her father, which stands out like a façade in front of the rest. (She had gone away from home by her own choice; her father was ill, and then dead. . . . Then she went home; all the others were already at the cemetery. She went to her room, not the least sadly, and calmly began reading the encyclopaedia.) This part of the material also contained two allusions to her other act of revenge, which she had actually carried out, when she let her parents discover a farewell letter from her. (The letter – from her mother, in the dream – and the mention of the funeral of the aunt who had always been her model.) – Behind this phantasy lie concealed her thoughts of revenge against Herr K., for which she found an outlet in her behaviour to me. (The maidservant, the invitation, the wood, the two and a half hours [in editions before 1924 'two hours'] – all these came from material connected with the events at L——.) Her recollection of the governess, and of the latter's exchange of letters with her parents, is related, no less than her farewell letter, to the letter in the dream allowing her to come home. Her refusal to let herself be accompanied and her decision to go alone may perhaps be translated into these words: 'Since you have treated me like a servant, I shall take no more notice of you, I shall go my own way by myself, and not marry.' – Screened by these thoughts of revenge, glimpses can be caught in other places of material derived from tender phantasies based upon the love for Herr K. which still persisted unconsciously in Dora. ('I would have waited for you till I could be your wife' – defloration – childbirth.) – Finally, we can see the action of the fourth and most deeply [111] buried group of thoughts – those relating to her love for Frau K. – in the fact that the phantasy of defloration is represented from the man's point of view (her identification of herself with her admirer who lived abroad) and in the fact that in two places there are the clearest allusions to ambiguous speeches ('Does Herr —— live here?') and to that source of her sexual knowledge which had not been oral (the encyclopaedia). – Cruel and sadistic tendencies find satisfaction in this dream.

IV
POSTSCRIPT

It is true that I have introduced this paper as a fragment of an analysis; [112]
but the reader will have discovered that it is incomplete to a far greater degree than its title might have led him to expect. It is therefore only proper that I should attempt to give a reason for the omissions – which are by no means accidental.

A number of the results of the analysis have been omitted, because at the time when work was broken off they had either not been established with sufficient certainty or they required further study before any general statement could be made about them. At other points, where it seemed to be permissible, I have indicated the direction along which some particular solution would probably have been found to lie. I have in this paper left entirely out of account the technique, which does not at all follow as a matter of course, but by whose means alone the pure metal of valuable unconscious thoughts can be extracted from the raw material of the patient's associations [*Einfällen*]. This brings with it the disadvantage of the reader being given no opportunity of testing the correctness of my procedure in the course of this exposition of the case. I found it quite impracticable, however, to deal simultaneously with the technique of analysis and with the internal structure of a case of hysteria: I could scarcely have accomplished such a task, and if I had, the result would have been almost unreadable. The technique of analysis demands an entirely separate exposition, which would have to be illustrated by numerous examples chosen from a very great variety of cases and which would not have to take the results obtained in each particular case into account. Nor have I attempted in this paper to substantiate the psychological postulates which will be seen to underlie my descriptions of mental phenomena. A cursory attempt to do so would have effected nothing; an exhaustive one would have been a volume in itself. I can only assure the reader that I approached the study of the phenomena revealed by observation of the psychoneuroses without being pledged to any particular psychological system, and that I then proceeded to adjust my

[113] views until they seemed adapted for giving an account of the collection of facts which had been observed. I take no pride in having avoided speculation; the material for my hypotheses was collected by the most extensive and laborious series of observations. The decidedness of my attitude on the subject of the unconscious is perhaps specially likely to cause offence, for I handle unconscious ideas [*Vorstellungen*][T], unconscious trains of thought [*Gedankenzügen*] and unconscious impulses [*Regungen*] as though they were no less valid and unimpeachable objects of psychological study than conscious ones. But of this I am certain – that anyone who sets out to investigate the same region of phenomena and employs the same method will find himself compelled to take up the same position, however much philosophers may expostulate.

Some of my medical colleagues have looked upon my theory of hysteria as a purely psychological one, and have for that reason pronounced it *ipso facto* incapable of solving a pathological problem. They may perhaps discover from this paper that their objection was based upon their having unjustifiably transferred what is a characteristic of the technique on to the theory itself. It is the therapeutic technique alone that is purely psychological; the theory does not by any means fail to point out that neuroses have an organic basis – though it is true that it does not look for that basis in any pathological anatomical changes, and provisionally substitutes the conception of organic functions for the chemical changes which we should expect to find but which we are at present unable to apprehend. No-one, probably, will be inclined to deny the sexual function the character of an organic factor, and it is the sexual function that I look upon as the foundation of hysteria and of the psychoneuroses in general. No theory of sexual life will, I suspect, be able to avoid assuming the existence of some definite sexual substances having an excitant action. Indeed, of all the clinical pictures which we meet with in clinical medicine, it is the phenomena of intoxication and abstinence in connection with the use of certain chronic poisons that most closely resemble the genuine psychoneuroses.[1]

But, once again, in the present paper I have not gone fully into all that might be said today about 'somatic compliance', about the infantile [114] germs of perversion, about the erotogenic zones, and about our predisposition towards bisexuality; I have merely drawn attention to the points at which the analysis comes into contact with these organic bases of the symptoms. More than this could not be done with a single case.

1 [Cf. the third of Freud's *Three Essays* (1905*d*), this volume, p. 191, and his second paper on sexuality and the aetiology of the neuroses (1906*a*), this volume, p. 288.]

And I had the same reasons that I have already mentioned for wishing to avoid a cursory discussion of these factors. There is a rich opportunity here for further works, based upon the study of a large number of analyses.

Nevertheless, in publishing this paper, incomplete though it is, I had two objects in view. In the first place, I wished to supplement my book on the interpretation of dreams by showing how an art, which would otherwise be useless, can be turned to account for the discovery of the hidden and repressed parts of mental life. (Incidentally, in the process of analysing the two dreams dealt with in the paper, the technique of dream interpretation, which is similar to that of psychoanalysis, has come under consideration.) In the second place, I wished to stimulate interest in a whole group of phenomena of which science is still in complete ignorance today because they can only be brought to light by the use of this particular method. No-one, I believe, can have had any true conception of the complexity of the psychological events in a case of hysteria – the juxtaposition of the most dissimilar tendencies, the mutual dependence of contrary ideas, the repressions and displacements, and so on. The emphasis laid by Janet upon the '*idée fixe*' which becomes transformed into a symptom amounts to no more than an extremely meagre attempt at schematization.[1] Moreover, it is impossible to avoid the suspicion that, when the ideas attaching to certain excitations [*Erregungen*] are incapable of becoming conscious, those excitations must act upon one another differently, run a different course, and manifest themselves differently from those other excitations which we describe as 'normal' and which have ideas attaching to them of which we become conscious. When once things have been made clear up to this point, no obstacle can remain in the way of an understanding of a therapeutic method which removes neurotic symptoms by transforming ideas of the former kind into normal ones.

I was further anxious to show that sexuality does not simply intervene, like a *deus ex machina*, on one single occasion, at some point in the working of the processes which characterize hysteria, but that it provides the driving force [*Triebkraft*] for every single symptom, and for every single manifestation of a symptom. The symptoms of the disease are nothing else than *the patient's sexual activity*. A single case can never be capable of proving a theorem so general as this one; but I can only repeat over and over again – for I never find it otherwise – that sexuality is the key to the problem of the psychoneuroses and of the neuroses in [115]

1 [See, for instance, Chapter II ('Les idées fixes') of Janet, 1894.]

general. No-one who disdains the key will ever be able to unlock the door. I still await news of the investigations which are to make it possible to contradict this theorem or to limit its scope. What I have hitherto heard against it have been expressions of personal dislike or disbelief. To these it is enough to reply in the words of Charcot: 'Ça n'empêche pas d'exister.'[1]

Nor is the case of whose history and treatment I have published a fragment in these pages well calculated to put the value of psychoanalytic therapy in its true light. Not only the briefness of the treatment (which hardly lasted three months) but another factor inherent in the nature of the case prevented results being brought about such as are attainable in other instances, where the improvement will be admitted by the patient and his relatives and will approximate more or less closely to a complete recovery. Satisfactory results of this kind are reached when the symptoms are maintained solely by the internal conflict between the impulses concerned with sexuality. In such cases the patient's condition will be seen improving in proportion as he is helped towards a solution to his mental problems by the translation of pathogenic into normal material. The course of events is very different when the symptoms have become enlisted in the service of external motives, as had happened with Dora during the two preceding years. It is surprising, and might easily be misleading, to find that the patient's condition shows no noticeable alteration even though considerable progress has been made with the work of analysis. But in reality things are not as bad as they seem. It is true that the symptoms do not disappear while the work is proceeding; but they disappear a little while later, when the relations between patient and physician have been dissolved. The postponement of recovery or improvement is really only caused by the physician's own person.

[116] I must go back a little, in order to make the matter intelligible. It may be safely said that during psychoanalytic treatment the formation of new symptoms is invariably stopped. But the productive powers of the neurosis are by no means extinguished; they are occupied in the creation of a special class of mental structures [*Gedankenbildungen*], for the most part unconscious, to which the name of '*transferences*' [*Übertragungen*] may be given.

What are transferences? They are new editions or facsimiles of the impulses and phantasies which are aroused and made conscious during the progress of the analysis; but they have this peculiarity, which is characteristic for their species, that they replace some earlier person with the

1 [One of Freud's favourite quotations; see his obituary of Charcot (1893*f*), *NSW*, **4**; *RSE*, **3**, 11 ff.]

person of the physician. To put it another way: a whole series of psychological experiences are revived, not as belonging to the past, but as applying to the person of the physician at the present moment. Some of these transferences have a content which differs from that of their model in no respect whatever except for the substitution. These then – to keep to the same metaphor – are merely new impressions or reprints. Others are more ingeniously constructed; their content has been subjected to a moderating influence – to *sublimation*, as I call it – and they may even become conscious, by cleverly taking advantage of some real peculiarity in the physician's person or circumstances and attaching themselves to that. These, then, will no longer be new impressions, but revised editions.

If the theory of analytic technique is gone into, it becomes evident that transference is an inevitable necessity. Practical experience, at all events, shows conclusively that there is no means of avoiding it, and that this latest creation of the disease must be combated like all the earlier ones. This happens, however, to be by far the hardest part of the whole task. It is easy to learn how to interpret dreams, to extract from the patient's associations his unconscious thoughts and memories, and to practise similar explanatory arts: for these the patient himself will always provide the text. Transference is the one thing the presence of which has to be detected almost without assistance and with only the slightest clues to go upon, while at the same time the risk of making arbitrary inferences has to be avoided. Nevertheless, transference cannot be evaded, since use is made of it in setting up all the obstacles that make the material inaccessible to treatment, and since it is only after the transference has [117] been resolved that a patient arrives at a sense of conviction of the validity of the connections which have been constructed during the analysis.

Some people may feel inclined to look upon it as a serious objection to a method which is in any case troublesome enough that it itself should multiply the labours of the physician by creating a new species of pathological mental products. They may even be tempted to infer from the existence of transferences that the patient will be injured by analytic treatment. Both these suppositions would be mistaken. The physician's labours are not multiplied by transference; it need make no difference to him whether he has to overcome any particular impulse of the patient's in connection with himself or with someone else. Nor does the treatment force upon the patient, in the shape of transference, any new task which he would not otherwise have performed. It is true that neuroses may be cured in institutions from which psychoanalytic treatment is

excluded, that hysteria may be said to be cured not by the method but by the physician, and that there is usually a sort of blind dependence and a permanent bond between a patient and the physician who has removed his symptoms by hypnotic suggestion; but the scientific explanation of all these facts is to be found in the existence of 'transferences' such as are regularly directed by patients on to their physicians. Psychoanalytic treatment does not *create* transferences, it merely brings them to light, like so many other hidden psychical factors. The only difference is this – that spontaneously a patient will only call up affectionate and friendly transferences to help towards his recovery; if they cannot be called up, he feels the physician is 'antipathetic' to him, and breaks away from him as fast as possible and without having been influenced by him. In psychoanalysis, on the other hand, since the play of motives is different, all the patient's tendencies, including hostile ones, are aroused; they are then turned to account for the purposes of the analysis by being made conscious, and in this way the transference is constantly being destroyed. Transference, which seems ordained to be the greatest obstacle to psychoanalysis, becomes its most powerfully ally, if its presence can be detected each time and explained to the patient.[1]

[118] I have been obliged to speak of transference, for it is only by means of this factor that I can elucidate the peculiarities of Dora's analysis. Its great merit, namely, the unusual clarity which makes it seem so suitable as a first introductory publication, is closely bound up with its great defect, which led to its being broken off prematurely. I did not succeed in mastering the transference in good time. Owing to the readiness with which Dora put one part of the pathogenic material at my disposal during the treatment, I neglected the precaution of looking out for the first signs of transference, which was being prepared in connection with another part of the same material – a part of which I was in ignorance. At the beginning it was clear that I was replacing her father in her imagination, which was not unlikely, in view of the difference between our ages. She was even constantly comparing me with him consciously, and kept anxiously trying to make sure whether I was being quite

1 [*Footnote added* 1923:] A continuation of these remarks upon transference is contained in my technical paper on 'transference love' (Freud, 1915*a*) [*RSE*, **12**, and in the earlier and more theoretical paper on 'The Dynamics of Transference' (1912*b*), ibid., **12**. – Freud had already discussed transference at some length in the last section but one of his chapter on 'The Psychotherapy of Hysteria' in *Studies on Hysteria* (Breuer & Freud, 1895*d*; ibid., **2**, 269 ff.). But the present passage is the first one in which he indicates the importance of transference as a factor in the therapeutic process of psychoanalysis. The term 'transference', which made its first appearance in *Studies on Hysteria*, was used in a slightly different and more generalized sense in some passages in *The Interpretation of Dreams*, 1900*a* (e.g. in Section C of Chapter VII; *RSE*, **5**, 503 f.)].

straightforward with her, for her father 'always preferred secrecy and roundabout ways'[t]. But when the first dream came, in which she gave herself the warning that she had better leave my treatment just as she had formerly left Herr K.'s house, I ought to have listened to the warning myself. 'Now,' I ought to have said to her, 'it is from Herr K. that you have made a transference on to me. Have you noticed anything that leads you to suspect me of evil intentions similar (whether openly or in some sublimated form) to Herr K.'s? Or have you been struck by anything about me or got to know anything about me which has caught your fancy, as happened previously with Herr K.?' Her attention would then have been turned to some detail in our relations, or in my person or circumstances, behind which there lay concealed something analogous but immeasurably more important concerning Herr K. And when this transference had been cleared up, the analysis would have obtained access to [119]
new memories, dealing, probably, with actual events. But I was deaf to this first note of warning, thinking I had ample time before me, since no further stages of transference developed and the material for the analysis had not yet run dry. In this way the transference took me unawares, and, because of the unknown quantity in me which reminded Dora of Herr K., she took her revenge on me as she wanted to take her revenge on him, and deserted me as she believed herself to have been deceived and deserted by him. Thus she *acted out* [*agierte*][T] an essential *Agieren*
part of her recollections and phantasies instead of reproducing it in the treatment.[1] What this unknown quantity was I naturally cannot tell. I suspect that it had to do with money, or with jealousy of another patient who had kept up relations with my family after her recovery. When it is possible to work transferences into the analysis at an early stage, the course of the analysis is retarded and obscured, but its existence is better guaranteed against sudden and overwhelming resistances.

In Dora's second dream there are several clear allusions to transference. At the time she was telling me the dream I was still unaware (and did not learn until two days later) that we had only *two hours* more work before us. This was the same length of time which she had spent in front of the Sistine Madonna [p. 86 above], and which (by making a correction and putting 'two hours' instead of 'two and a half hours') she had taken as the length of the walk which she had not[2] made round the lake [p. 88]. The striving and waiting in the dream, which related to the young man

1 [This important topic was later discussed in another of Freud's technical papers (1914g), *RSE*, **12**, 147 f.]

2 [In the German editions from 1909 to 1921 this 'not' was accidentally omitted.]

in Germany, and had their origin in her waiting till Herr K. could marry her, had been expressed in the transference a few days before. The treatment, she had thought, was too long for her; she would never have the patience to wait so long. And yet in the first few weeks she had had discernment enough to listen without making any such objections when I informed her that her complete recovery would require perhaps a year. Her refusing in the dream to be accompanied, and preferring to go alone, also originated from her visit to the gallery at Dresden, and I was myself to experience them on the appointed day. What they meant was, no doubt: 'Men are all so detestable that I would rather not marry. This is my revenge.'[1]

[120]

If cruel impulses and revengeful motives, which have already been used in the patient's ordinary life for maintaining her symptoms, become transferred on to the physician during treatment, before he has had time to detach them from himself by tracing them back to their sources, then it is not to be wondered at if the patient's condition is unaffected by his therapeutic efforts. For how could the patient take a more effective revenge than by demonstrating upon her own person the helplessness and incapacity of the physician? Nevertheless, I am not inclined to put too low a value on the therapeutic results even of such a fragmentary treatment as Dora's.

It was not until fifteen months after the case was over and this paper composed that I had news of my patient's condition and the effects of my treatment. On a date which is not a matter of complete indifference, on the first of April (times and dates, as we know, were never without significance for her), Dora came to see me again: to finish her story and to ask for help once more. One glance at her face, however, was enough

1 The longer the interval of time that separates me from the end of this analysis, the more probable it seems to me that the fault in my technique lay in this omission: I failed to discover in time and to inform the patient that her homosexual (gynaecophilic) love for Frau K. was the strongest unconscious current in her mental life. I ought to have guessed that the main source of her knowledge of sexual matters could have been no-one but Frau K. – the very person who later on charged her with being interested in those same subjects. Her knowing all about such things and, at the same time, her always pretending not to know where her knowledge came from was really too remarkable. [Cf. p. 28 f. above.] I ought to have attacked this riddle and looked for the motive of such an extraordinary piece of repression. If I had done this, the second dream would have given me my answer. The remorseless craving for revenge expressed in that dream was suited as nothing else was to conceal the current of feeling that ran contrary to it – the magnanimity with which she forgave the treachery of the friend she loved and concealed from everyone the fact that it was this friend who had herself revealed to her the knowledge which had later been the ground of the accusations against her. Before I had learnt the importance of the homosexual current of feeling in psychoneurotics, I was often brought to a standstill in the treatment of my cases or found myself in complete perplexity.

to tell me that she was not in earnest over her request. For four or five [121]
weeks after stopping the treatment she had been 'all in a muddle', as she said. A great improvement had then set in; her attacks had become less frequent and her spirits had risen. In the May of that year one of the K.s' two children (it had always been delicate) had died. She took the opportunity of their loss to pay them a visit of condolence, and they received her as though nothing had happened in the last three years. She made it up with them, she took her revenge on them, and she brought her own business to a satisfactory conclusion. To the wife she said: 'I know you have an affair with my father'; and the other did not deny it. From the husband she drew an admission of the scene by the lake which he had disputed, and brought the news of her vindication home to her father. Since then she had not resumed her relations with the family.

After this she had gone on quite well till the middle of October, when she had had another attack of aphonia which had lasted for six weeks. I was surprised at this news, and, on my asking her whether there had been any exciting cause, she told me that the attack had followed upon a violent fright. She had seen someone run over by a carriage. Finally, she came out with the fact that the accident had occurred to no less a person than Herr K. himself. She had come across him in the street one day; they had met in a place where there was a great deal of traffic; he had stopped in front of her as though in bewilderment, and in his abstraction he had allowed himself to be knocked down by a carriage.[1] She had been able to convince herself, however, that he escaped without serious injury. She still felt some slight emotion if she heard anyone speak of her father's affair with Frau K., but otherwise she had no further concern with the matter. She was absorbed in her work, and had no thoughts of marrying.

She went on to tell me that she had come for help on account of a right-sided facial neuralgia, from which she was now suffering day and night. 'How long has it been going on?' 'Exactly a fortnight.'[2] I could not help smiling; for I was able to show her that exactly a fortnight earlier [122]
she had read a piece of news that concerned me in the newspaper. (This was in 1902.)[3] And this she confirmed.

Her alleged facial neuralgia was thus a self-punishment – remorse at having once given Herr K. a box on the ear, and at having transferred

1 We have here an interesting contribution to the problem of indirect attempts at suicide, which I have discussed in my *Psychopathology of Everyday Life* [1901*b*, Chapter VIII; *RSE*, **6**, 154 ff.].

2 For the significance of this period of time and its relation to the theme of revenge, see the analysis of the second dream [p. 93 ff. above].

3 [No doubt the news was of Freud's appointment to a professorship in March of that year.]

her feelings of revenge on to me. I do not know what kind of help she wanted from me, but I promised to forgive her for having deprived me of the satisfaction of affording her a far more radical cure for her troubles.

Years have again gone by since her visit. In the meantime the girl has married, and indeed – unless all the signs mislead me – she has married the young man who came into her associations at the beginning of the analysis of the second dream.[1] Just as the first dream represented her turning away from the man she loved to her father – that is to say, her flight from life into disease – so the second dream announced that she was about to tear herself free from her father and had been reclaimed once more by the realities of life.

1 [P. 85 f. above. – In the editions of 1909, 1912 and 1921 the following footnote appeared at this point: 'This, as I afterwards learnt, was a mistaken notion.']

Three Essays on the Theory of Sexuality

Three Essays on Sexual Theory
2006 *PMC*, *The Psychology of Love*, 111–220. (Tr. Shaun Whiteside.)

The present translation is a revised and corrected reprint of the *SE* version.

Freud's *Three Essays on the Theory of Sexuality* stand, there can be no doubt, [126] beside his *Interpretation of Dreams* as his most momentous and original contributions to human knowledge. Nevertheless, in the form in which we usually read these essays, it is difficult to estimate the precise nature of their impact when they were

first published. For they were submitted by their author, in the course of a succession of editions over a period of twenty years, to more modifications and additions than any other of his writings, with the exception of, perhaps, *The Interpretation of Dreams* itself.[1] The present edition differs in an important respect from all editions, whether in German or English, published before the *SE*. Though it is based on the German sixth edition of 1925, the last published in Freud's lifetime, it indicates, with dates, every alteration of substance that has been introduced into the work since its first issue. Wherever material has been dropped or greatly modified in later editions, the cancelled passage or earlier version is given in a footnote. This enables the reader to arrive at a clearer notion of what these essays were like in their original shape.

It will probably come as a surprise to learn, for instance, that the entire sections on the sexual theories of children and on the pregenital organizations of the libido (both in the second essay) were only added in 1915, ten years after the book was first published. The same year, too, brought the addition of the section on the libido theory to the third essay. Less surprisingly, the advances of biochemistry made it necessary (in 1920) to rewrite the paragraph on the chemical basis of sexuality. Here, indeed, the surprise works the other way. For the original version of this paragraph, here printed in a footnote, shows Freud's remarkable foresight in this connection and how little modification was required in his views (p. 191 below).

But in spite of the considerable additions made to the book after its first appearance, its essence was already there in 1905 and can, indeed, be traced back to still earlier dates. The whole history of Freud's concern with the subject can, thanks to the publication of the Fliess correspondence (1950*a*), be followed in detail; but here it will be enough to indicate its outlines. Clinical observations of the importance of
[127] sexual factors in the causation, first, of anxiety neurosis and neurasthenia, and later, of the psychoneuroses, were what first led Freud into a general investigation of the subject of sexuality. His first approaches, during the early nineties, were from the physiological and chemical standpoints. A hypothesis along neurophysiological lines, for instance, of the processes of sexual excitation and discharge can be found in Section III of his first paper on anxiety neurosis (1895*b*), *RSE*, **3**; and a remarkable diagram illustrating this hypothesis occurs in Draft G in the Fliess letters at about the same date but had been mentioned a year earlier (in Draft D). Freud's insistence on the chemical basis of sexuality goes back at least as far as this. (It, too, is alluded to in Draft D, probably dating to the spring of 1894.) In this case Freud believed that he owed much to suggestions from Fliess, as is shown in, among other places, his associations to the famous dream of 'Irma's injection' in the summer of 1895 (*The Interpretation of Dreams*, 1900*a*, Chapter II). He was also indebted to Fliess for hints on the kindred subject of bisexuality (p. 128 *n*. 2 below), which he mentioned in a letter of December 6, 1896 (Letter 52)[2] and later came to regard as a 'decisive factor' (p. 194 below), though his ultimate opinion on the operation of that factor brought him into disagreement with Fliess. It was in this same letter at the end of 1896 (Freud, 1950*a*, Letter 52) that we find the first mention of erotogenic zones (liable to

1 Freud himself commented at some length on this circumstance, and the possible inconsistencies it might have introduced into the text, in the second paragraph of his paper on the 'phallic phase' (1923*e*), *RSE*, **19**, 131.

2 References to the Fliess letters are to the 1954 translation by Mosbacher & Strachey. (See *RSE*, **1**, xxx.)

stimulation in childhood but later suppressed) and their connections with perversions. And, again, at the beginning of the same year (Draft K, of January 1, 1896) – and here we can see indications of a more psychological approach – a discussion appears of the repressive forces, disgust, shame and morality.

But though so many elements of Freud's theory of sexuality were already present in his mind by 1896, its keystone was still to be discovered. There had from the very first been a suspicion that the causative factors of hysteria went back to childhood; the fact is alluded to in the opening paragraphs of the Breuer & Freud 'Preliminary Communication' of 1893. By 1895 (see, for instance, Part II of the 'Project', *RSE*, **1**, 377 ff.) Freud had a complete explanation of hysteria based on the traumatic effects of sexual seduction in early childhood. But during all these years before 1897 infantile sexuality was regarded as no more than a dormant factor, only liable to be brought into the open, with disastrous results, by the intervention of an adult. An apparent exception to this might, it is true, be supposed to follow from the contrast [128] drawn by Freud between the causation of hysteria and obsessional neurosis: the former, he maintained, could be traced to *passive* sexual experiences in childhood, but the latter to *active* ones. But Freud makes it quite plain in his second paper on the 'Neuropsychoses of Defence' (1896*b*), ibid., **3**, in which this distinction is drawn, that the active experiences at the bottom of obsessional neurosis are invariably *preceded* by passive ones – so that once again the stirring up of infantile sexuality was ultimately due to external interference. It was not until the summer of 1897 that Freud found himself obliged to abandon his seduction theory. He announced the event in a letter to Fliess of September 21 (Letter 69),[1] and his almost simultaneous discovery of the Oedipus complex in his self-analysis (Letters 70 and 71 of October 3 and 15) led inevitably to the realization that sexual impulses operated normally in the youngest children without any need for outside stimulation. With this realization Freud's sexual theory was in fact completed.

It took some years, however, for him to become entirely reconciled to his own discovery. In a passage, for instance, in his paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), *RSE*, **3**, 274, he blows hot and cold on it. On the one hand, he says that children are 'capable of every psychical sexual activity, and many somatic sexual ones' and that it is wrong to suppose that their sexual life begins only at puberty. But on the other hand he declares that 'the organization and evolution of the human species strives to avoid any great degree of sexual activity during childhood', that the sexual driving forces in human beings should be stored up and only released at puberty and that this explains why sexual experiences in childhood are bound to be pathogenic. It is, he goes on, the *after-effects* produced by such experiences in maturity that are important, owing to the development of the somatic and psychical sexual apparatus that has taken place in the meantime. Even in the first edition of *The Interpretation of Dreams* (1900*a*), there is a curious passage towards the end of Chap- [129] ter III (*RSE*, **4**, 116), in which Freud remarks that 'we think highly of the happiness of childhood because it is still innocent of sexual desires'. (A corrective footnote

1 His abandonment of the seduction theory was first publicly announced in a brief passage and footnote in the present work (p. 169 below) and soon afterwards at greater length in his second paper on 'The Part Played by Sexuality in the Aetiology of the Neuroses' (1906*a*; this volume, p. 283 ff.). However, he had already in 1903 communicated his changed views to Löwenfeld, who published them in 1904 (see also Freud, 1904*f*; p. 233 ff. below). He later described his own reactions to the event in his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 14 f., and in his *Autobiographical Study* (1925*d*), ibid., **20**, 28–30.

was added to this passage in 1911, according to Ernest Jones on Jung's suggestion.) This was no doubt a relic from an early draft of the book, for elsewhere (e.g. in his discussion of the Oedipus complex in Chapter V) he writes quite unambiguously of the existence of sexual wishes even in normal children. And it is evident that by the time he drew up his case history of 'Dora' (at the beginning of 1901) the main lines of his theory of sexuality were firmly laid down. (See above, p. 5.)

Even so, however, he was in no hurry to publish his results. When *The Interpretation of Dreams* was finished and on the point of appearing, on October 11, 1899 (Letter 121), he wrote to Fliess: 'A theory of sexuality might well be the dream book's immediate successor'; and three months later, on January 26, 1900 (Letter 128): 'I am putting together material for the theory of sexuality and waiting till some spark can set what I have collected ablaze.' But the spark was a long time in coming. Apart from the little essay *On Dreams* and *The Psychopathology of Everyday Life*, both of which appeared before the autumn of 1901, Freud published nothing of importance for another five years.

Then, suddenly, in 1905 he brought out three major works: his book on *Jokes*, his *Three Essays* and his case history of 'Dora'. It is certain that the last named of these had for the most part been written four years earlier (see p. 3 ff. above); it was published in October and November, 1905. Freud worked on the other two simultaneously: Jones (1955, 13) tells us that Freud kept the two manuscripts on adjoining tables, adding to each according to his mood. The two books were published almost simultaneously; the exact dates are uncertain, but they were at least four months before the appearance of the 'Dora' case history.

In the German editions the sections are numbered only in the first essay; and indeed before 1924 they were numbered only halfway through the first essay. For convenience of reference, the numbering of the sections has here been extended to the second and third essays.

PREFACE TO THE SECOND EDITION[1]

The author is under no illusion as to the deficiencies and obscurities of this little work. Nevertheless, he has resisted the temptation of introducing into it the results of the researches of the last five years, since this would have destroyed its unity and documentary character. He is, therefore, reprinting the original text with only slight alterations, and has contented himself with adding a few footnotes which are distinguished from the older ones by an asterisk.[2] It is, moreover, his earnest wish that the book may age rapidly – that what was once new in it may become generally accepted, and that what is imperfect in it may be replaced with something better. [130]

Vienna, December, 1909

1 [This Preface was omitted from 1920 onwards. The German text was, however, reprinted in *GW*, **Nachtr.**, 739.]

2 [The distinction was dropped in all subsequent editions.]

PREFACE TO THE THIRD EDITION

I have now been watching for more than ten years the effects produced by this work and the reception accorded to it; and I take the opportunity offered by the publication of its third edition to preface it with a few remarks intended to prevent misunderstandings and expectations that cannot be fulfilled. It must above all be emphasized that the exposition to be found in the following pages is based entirely upon everyday medical observation, to which the findings of psychoanalytic research should lend additional depth and scientific significance. It is impossible that these *Three Essays on the Theory of Sexuality* should contain anything but what psychoanalysis makes it necessary to assume or possible to establish. It is, therefore, out of the question that they could ever be extended into a complete 'theory of sexuality', and it is natural that there should be a number of important problems of sexual life with which they do not deal at all. But the reader should not conclude from this that the branches of this large subject which have been thus passed over are unknown to the author or have been neglected by him as of small importance.

[131] The fact that this book is based upon the psychoanalytic observations which led to its composition is shown, however, not only in the choice of the topics dealt with, but also in their arrangement. Throughout the entire work the various factors are placed in a particular order of precedence: preference is given to the accidental factors, while disposition is left in the background, and more weight is attached to ontogenesis than to phylogenesis. For it is the accidental factors that play the principal part in analysis: they are almost entirely subject to its influence. The dispositional ones only come to light after them, as something stirred into activity by experience: adequate consideration of them would lead far beyond the sphere of psychoanalysis.

The relation between ontogenesis and phylogenesis is a similar one. Ontogenesis may be regarded as a recapitulation of phylogenesis,[1]

1 [This is the 'biogenetic law' of Ernst Haeckel (1866) who also introduced the terms 'ontogenesis' and 'phylogenesis'.]

insofar as the latter has not been modified by more recent experience. The phylogenetic disposition can be seen at work behind the ontogenetic process. But disposition is ultimately the precipitate of earlier experience of the species[1] to which the more recent experience of the individual, as the sum of the accidental factors, is superadded.

I must, however, emphasize that the present work is characterized not only by being completely based upon psychoanalytic research, but also by being deliberately independent of the findings of biology. I have carefully avoided introducing any preconceptions, whether derived from general sexual biology or from that of particular animal species, into this study – a study which is concerned with the sexual functions of human beings and which is made possible through the technique of psychoanalysis. Indeed, my aim has rather been to discover how far psychological investigation can throw light upon the biology of the sexual life of man. It was legitimate for me to indicate points of contact and agreement which came to light during my investigation, but there was no need for me to be diverted from my course if the psychoanalytic method led in a number of important respects to opinions and findings which differed largely from those based on biological considerations.

In this third edition I have introduced a considerable amount of fresh matter, but have not indicated it in any special way, as I did in the previous edition. Progress in our field of scientific work is at present less rapid; nevertheless it was essential to make a certain number of additions to this volume if it was to be kept in touch with recent psychoanalytic literature.[2] [132]

Vienna, October, 1914

1 [This is Jean-Baptiste de Lamarck's (1809) theory of 'heritability of acquired characteristics' which Freud endorsed despite increasing criticism. Cf. Freud (1939*a*), *RSE*, **23**, 90 f., and (1940*a* [1938]), ibid., **23**, 150 and 186.]

2 [The following footnote appeared at this point in 1915 only:] In 1910, after the publication of the second edition, an English translation by A. A. Brill was published in New York; and in 1911 a Russian one by N. Ossipow in Moscow. [Translations also appeared during Freud's lifetime in Hungarian (1915), Italian (1921), Spanish (1922), French (1923), Polish (1924), Czech (1926) and Japanese (1931).]

PREFACE TO THE FOURTH EDITION

[133] Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psychoanalytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psychoanalysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psychoanalysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

Nevertheless, I cannot bring myself to accept the idea that this part of psychoanalytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation for this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psychoanalysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

[134] It must also be remembered, however, that some of what this book contains – its insistence on the importance of sexuality in all human achievements and the attempt that it makes at enlarging the concept of sexuality – has from the first provided the strongest motives for the resistance against psychoanalysis. People have gone so far in their search for high-sounding catchwords as to talk of the 'pan-sexualism' of psychoanalysis and to raise the senseless charge against it of explaining 'everything' by sex. We might be astonished at this, if we ourselves could forget the way in which emotional factors make people confused and forgetful. For it is some time since Arthur Schopenhauer, the philosopher, showed mankind the extent to which their activities are determined by sexual impulses – in the ordinary sense of the word. It should surely have been impossible for a whole world of readers to banish such a startling piece of information so completely from their minds. And as for the 'stretching' of the concept of sexuality which has been necessitated by the analysis of children and what are called perverts, anyone who looks down with contempt upon psychoanalysis from a superior vantage-point should remember how closely the enlarged sexuality of psychoanalysis coincides with the Eros of the divine Plato. (Cf. Nachmansohn, 1915.)

Vienna, May, 1920

THREE ESSAYS ON THE THEORY OF SEXUALITY

I

THE SEXUAL ABERRATIONS[1]

The fact of the existence of sexual needs in human beings and animals is expressed in biology by the assumption of a 'sexual drive' ['*Geschlechtstriebes*'][T] on the analogy of the drive to take nourishment [*Trieb nach Nahrungsaufnahme*], that is of hunger. Everyday language possesses no counterpart to the word 'hunger', but science makes use of the word 'libido' for that purpose.[2] [135] *Geschlecht* *Trieb*

Popular opinion has quite definite ideas about the nature and characteristics of this sexual drive. It is generally understood to be absent in childhood, to set in at the time of puberty in connection with the process of coming to maturity and to be revealed in the manifestations of an irresistible attraction exercised by one sex upon the other; while its aim is presumed to be sexual union, or at all events actions leading in that direction. We have every reason to believe, however, that these views give a very false picture of the true situation. If we look into them more closely we shall find that they contain a number of errors, inaccuracies and hasty conclusions.

I shall at this point introduce two technical terms. Let us call the person from whom sexual attraction proceeds the *sexual object* and the act towards which the drive tends the *sexual aim*. Scientifically sifted observation, then, shows that numerous deviations occur in respect of both of these – the sexual object and the sexual aim. The relation between these deviations and what is assumed to be normal requires thorough investigation. [136]

1 The information contained in this first essay is derived from the well-known writings of Krafft-Ebing, Moll, Moebius, Havelock Ellis, Schrenck-Notzing, Löwenfeld, Eulenburg, Bloch and Hirschfeld, and from the *Jahrbuch für sexuelle Zwischenstufen*, published under the direction of the last-named author. Since full bibliographies of the remaining literature of the subject can be found in the works of these writers, I have been able to spare myself the necessity for giving detailed references. [*Added* 1910:] The data obtained from the psychoanalytic investigation of inverts are based upon material supplied to me by I. Sadger and upon my own findings.

2 [*Footnote added* 1910:] The only appropriate word in the German language, '*Lust*', is unfortunately ambiguous, and is used to denote the experience both of a need and of a gratification. [Unlike the English 'lust' it can mean either 'desire' or 'pleasure'. See footnote, p. 188 below, and *RSE*, **24**, 74–5.]

(1) DEVIATIONS IN RESPECT OF THE SEXUAL OBJECT

The popular view of the sexual drive is beautifully reflected in the poetic fable which tells how the original human beings were cut up into two halves – man and woman – and how these are always striving to unite again in love.[1] It comes as a great surprise therefore to learn that there are men whose sexual object is a man and not a woman, and women whose sexual object is a woman and not a man. People of this kind are described as having 'contrary sexual feelings', or better, as being 'inverts', and the fact is described as 'inversion'. The number of such people is very considerable, though there are difficulties in establishing it precisely.[2]

(A) INVERSION

Behaviour of Inverts[3]

Such people vary greatly in their behaviour in several respects.

(*a*) They may be *absolute* inverts. In that case their sexual objects are exclusively of their own sex. Persons of the opposite sex are never the object of their sexual desire, but leave them cold, or even arouse sexual aversion in them. As a consequence of this aversion, they are incapable, if they are men, of carrying out the sexual act, or else they derive no enjoyment from it.

(*b*) They may be *amphigenic* inverts, that is psychosexual hermaphrodites. In that case their sexual objects may equally well be of their own or of the opposite sex. This kind of inversion thus lacks the characteristic of exclusiveness.

[137] (*c*) They may be *contingent* inverts. In that case, under certain external conditions – of which inaccessibility of any normal sexual object and imitation are the chief – they are capable of taking as their sexual object someone of their own sex and of deriving satisfaction from sexual intercourse with him.

Again, inverts vary in their views as to the peculiarity of their sexual

1 [This is no doubt an allusion to the theory expounded by Aristophanes in Plato's *Symposium*. Freud returned to this much later, in Chapter VI of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 55 f.]

2 On these difficulties and on the attempts which have been made to arrive at the proportional number of inverts, see Hirschfeld (1904).

3 [In the German original these italicized subheadings appeared in the left margin, adjacent to the text.]

drive. Some of them accept their inversion as something in the natural course of things, just as a normal person accepts the direction of *his* libido, and insist energetically that inversion is as legitimate as the normal attitude; others rebel against their inversion and feel it as a pathological compulsion.[1]

Other variations occur which relate to questions of time. The trait of inversion may either date back to the very beginning, as far back as the subject's memory reaches, or it may not have become noticeable till some particular time before or after puberty.[2] It may either persist throughout life, or it may go into temporary abeyance, or again it may constitute an episode on the way to a normal development. It may even make its first appearance late in life after a long period of normal sexual activity. A periodic oscillation between a normal and an inverted sexual object has also sometimes been observed. Those cases are of particular interest in which the libido changes over to an inverted sexual object after a distressing experience with a normal one.

As a rule these different kinds of variations are found side by side independently of one another. It is, however, safe to assume that the most extreme form of inversion will have been present from a very early age and that the person concerned will feel at one with his peculiarity.

Many authorities would be unwilling to class together all the various [138] cases which I have enumerated and would prefer to lay stress upon their differences rather than their resemblances, in accordance with their own preferred view of inversion. Nevertheless, though the distinctions cannot be disputed, it is impossible to overlook the existence of numerous intermediate examples of every type, so that we are driven to conclude that we are dealing with a connected series.

Conceptualizing Inversion[3]

The earliest assessments regarded inversion as an innate indication of nervous degeneracy. This corresponded to the fact that medical observers first came across it in persons suffering, or appearing to suffer, from nervous diseases. This characterization of inversion involves two

1 The fact of a person struggling in this way against a compulsion towards inversion may perhaps determine the possibility of his being influenced by suggestion [*added* 1910:] or psychoanalysis.

2 Many writers have insisted with justice that the dates assigned by inverts themselves for the appearance of their tendency to inversion are untrustworthy, since they may have repressed the evidence of their heterosexual feelings from their memory. [*Added* 1910:] These suspicions have been confirmed by psychoanalysis in those cases of inversion to which it has had access; it has produced decisive alterations in their anamnesis by filling in their infantile amnesia. – [In the first edition (1905) the place of this last sentence was taken by the following one: 'A decision on this point could be arrived at only by a psychoanalytic investigation of inverts.']

3 [*Auffassung der Inversion*.]

suppositions, which must be considered separately: that it is innate and that it is degenerate.

Degeneracy

The attribution of degeneracy in this connection is open to the objections which can be raised against the indiscriminate use of the word in general. It has become the fashion to regard any symptom which is not obviously due to trauma or infection as a sign of degeneracy. Magnan's classification of degenerates is indeed of such a kind as not to exclude the possibility of the concept of degeneracy being applied to a nervous system whose general functioning is excellent. This being so, it may well be asked whether an attribution of 'degeneracy' is of any value or adds anything to our knowledge. It seems wiser only to speak of it where

(1) several serious deviations from the normal are found together, and

(2) the capacity for efficient functioning and survival seem to be severely impaired.[1]

Several facts go to show that in this legitimate sense of the word inverts cannot be regarded as degenerate:

(1) Inversion is found in people who exhibit no other serious deviations from the normal.

[139] (2) It is similarly found in people whose efficiency is unimpaired, and who are indeed distinguished by specially high intellectual development and ethical culture.[2]

(3) If we disregard the patients we come across in our medical practice, and cast our eyes round a wider horizon, we shall come in two directions upon facts which make it impossible to regard inversion as a sign of degeneracy:

(*a*) Account must be taken of the fact that inversion was a frequent phenomenon – one might almost say an institution charged with important functions – among the peoples of antiquity at the height of their civilization.

1 Moebius (1900) confirms the view that we should be chary in making a diagnosis of degeneracy and that it has very little practical value: 'If we survey the wide field of degeneracy upon which some glimpses of revealing light have been thrown in these pages, it will at once be clear that there is small value in ever making a diagnosis of degeneracy.'

2 It must be allowed that the spokesmen of 'Uranism' are justified in asserting that some of the most prominent men in all recorded history were inverts and perhaps even absolute inverts. [The term 'Uranism' (derived from Uranos in Plato's *Symposium*) was coined by Karl Heinrich Ulrichs, who used it as early as 1862. See also p. 128 and *n*. 1 below.]

(*b*) It is remarkably widespread among many savage and primitive races, whereas the concept of degeneracy is usually restricted to states of high civilization (cf. Bloch); and, even among the civilized peoples of Europe, climate and race exercise the most powerful influence on the prevalence of inversion and upon the attitude adopted towards it.[1]

Innateness

As may be supposed, innateness is attributed only to the first, most extreme, class of inverts, and the evidence for it rests upon assurances given by them that at no time in their lives has their sexual drive shown any sign of taking another course. The very existence of the two other classes, and especially the third [the 'contingent' inverts], is difficult to reconcile with the hypothesis of the innateness of inversion. This explains why those who support this view tend to separate out the group of absolute inverts from all the rest, thus abandoning any attempt at giving an account of inversion which shall have universal application. In the view of these authorities inversion is innate in one group of cases, while in others it may have come about in other ways.

The reverse of this view is represented by the alternative one that inversion is an *acquired* character of the sexual drive. This second view [140] is based on the following considerations:

(1) In the case of many inverts, even absolute ones, it is possible to show that very early in their lives a sexual impression occurred which left a permanent after-effect in the shape of a tendency to homosexuality.

(2) In the case of many others, it is possible to point to external influences in their lives, whether of a favourable or inhibiting character, which have led sooner or later to a fixation of their inversion. (Such influences are exclusive relations with persons of their own sex, comradeship in war, detention in prison, the dangers of heterosexual intercourse, celibacy, sexual weakness, etc.)

(3) Inversion can be removed by hypnotic suggestion, which would be astonishing in an innate characteristic.

In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis, [1897]) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the

1 The pathological approach to the study of inversion has been displaced by the anthropological. The merit for bringing about this change is due to Bloch (1902–3), who has also laid stress on the occurrence of inversion among the civilizations of antiquity.

direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual drive, which can be determined by a number of external circumstances in the subject's life.

The apparent certainty of this conclusion is, however, completely countered by the reflection that many people are subjected to the same sexual influences (e.g. to seduction or mutual masturbation, which may occur in early youth) without becoming inverted or without remaining so permanently. We are therefore forced to a suspicion that the choice between 'innate' and 'acquired' is not an exclusive one or that it does not cover all the issues involved in inversion.

Explanation of Inversion

The nature of inversion is explained neither by the hypothesis that it is innate nor by the alternative hypothesis that it is acquired. In the former case we must ask in what respect it is innate, unless we are to accept the
[141] crude explanation that everyone is born with his sexual drive attached to a particular sexual object. In the latter case it may be questioned whether the various accidental influences would be sufficient to explain the acquisition of inversion without the cooperation of something in the subject himself. As we have already shown, the existence of this last factor is not to be denied.

Bisexuality

A fresh contradiction of popular views is involved in the considerations put forward by Lydston [1889], Kiernan [1888] and Chevalier [1893] in an endeavour to account for the possibility of sexual inversion. It is popularly believed that a human being is either a man or a woman. Science, however, knows of cases in which the sexual characters are obscured, and in which it is consequently difficult to determine the sex. This arises in the first instance in the field of anatomy. The genitals of the individuals concerned combine male and female characteristics. (This condition is known as hermaphroditism.) In rare cases both kinds of sexual apparatus are found side by side fully developed (true hermaphroditism); but far more frequently both sets of organs are found in an atrophied condition.[1]

1 For the most recent descriptions of somatic hermaphroditism, see Taruffi (1903), and numerous papers by Neugebauer in various volumes of the *Jahrbuch für sexuelle Zwischenstufen*.

The importance of these abnormalities lies in the unexpected fact that they facilitate our understanding of normal development. For it appears that a certain degree of anatomical hermaphroditism occurs normally. In every normal male or female individual, traces are found of the apparatus of the opposite sex. These either persist without function as rudimentary organs or become modified and take on other functions.

These long-familiar facts of anatomy lead us to suppose that an originally bisexual physical disposition has, in the course of evolution, become modified into a unisexual one, leaving behind only a few traces of the sex that has become atrophied.

It was tempting to extend this hypothesis to the mental sphere and to explain inversion in all its varieties as the expression of a psychical hermaphroditism. All that was required further in order to settle the question was that inversion should be regularly accompanied by the mental and somatic signs of hermaphroditism.

But this expectation was disappointed. It is impossible to demonstrate [142]
so close a connection between the hypothetical psychical hermaphroditism and the established anatomical one. A general lowering of the sexual drive and a slight anatomical atrophy of the organs is found frequently in inverts (cf. Havelock Ellis, 1897). Frequently, but by no means regularly or even usually. The truth must therefore be recognized that inversion and somatic hermaphroditism are on the whole independent of each other.

A great deal of importance, too, has been attached to what are called the secondary and tertiary sexual characters and to the great frequency of the occurrence of those of the opposite sex in inverts (cf. Havelock Ellis, 1897). Much of this, again, is correct; but it should never be forgotten that in general the secondary and tertiary sexual characters of one sex occur very frequently in the opposite one. They are indications of hermaphroditism, but are not attended by any change of sexual object in the direction of inversion.

Psychical hermaphroditism would gain substance if the inversion of the sexual object were at least accompanied by a parallel changeover of the subject's other mental qualities, drives and character traits into those marking the opposite sex. But it is only in inverted women that character inversion of this kind can be looked for with any regularity. In men the most complete mental masculinity can be combined with inversion. If the belief in psychical hermaphroditism is to be persisted in, it will be necessary to add that its manifestations in various spheres show only slight signs of being mutually determined. Moreover, the same is true of somatic hermaphroditism: according to Halban (1903),[1]

1 His paper includes a bibliography of the subject.

occurrences of individual atrophied organs and of secondary sexual characters are to a considerable extent independent of one another.

The theory of bisexuality has been expressed in its crudest form by a spokesman of the male inverts: 'a feminine brain in a masculine body'.[1] But we are ignorant of what characterizes a feminine brain. There is neither need nor justification for replacing the psychological problem with the anatomical one. Krafft-Ebing's attempted explanation seems to be more exactly framed than that of Ulrichs but does not differ from
[143] it in essentials. According to Krafft-Ebing [1895*a*, 5], every individual's bisexual disposition endows him with masculine and feminine brain centres as well as with somatic organs of sex; these centres develop only at puberty, for the most part under the influence of the sex gland, which is independent of them in the original disposition. But what has just been said of masculine and feminine brains applies equally to masculine and feminine 'centres'; and incidentally we have not even any grounds for assuming that certain circumscribed areas of the brain ('centres') are set aside for the functions of sex, as is the case, for instance, with those of language.[2]

Nevertheless, two things emerge from these discussions. In the first
[144] place, a bisexual disposition is somehow concerned in inversion, though we do not know in what that disposition consists, beyond anatomical

1 [The description was Ulrichs'. '*Anima muliebris in corpore virili inclusa*.']

2 It appears (from a bibliography given in the sixth volume of the *Jahrbuch für sexuelle Zwischenstufen*) that E. Gley was the first writer to suggest bisexuality as an explanation of inversion. As long ago as in January, 1884, he published a paper, 'Les aberrations de l'instinct sexuel', in the *Revue Philosophique*. It is, moreover, noteworthy that the majority of authors who derive inversion from bisexuality bring forward that factor not only in the case of inverts, but also for all those who have grown up to be normal, and that, as a logical consequence, they regard inversion as the result of a disturbance in development. Chevalier (1893) already writes in this sense. Krafft-Ebing (1895*a*, [10]) remarks that there are a great number of observations 'which prove at least the virtual persistence of this second centre (that of the subordinated sex)'. A Dr Arduin (1900) asserts that 'there are masculine and feminine elements in every human being (cf. Hirschfeld, 1899); but one set of these – according to the sex of the person in question – is incomparably more strongly developed than the other, so far as heterosexual individuals are concerned. . . .' Herman (1903) is convinced that 'masculine elements and characteristics are present in every woman and feminine ones in every man', etc. [*Added* 1910:] Fliess (1906) subsequently claimed the idea of bisexuality (in the sense of *duality of sex*) as his own. [*Added* 1924:] In lay circles the hypothesis of human bisexuality is regarded as being due to O. Weininger, the philosopher, who died at an early age, and who made the idea the basis of a somewhat unbalanced book (1903). The particulars which I have enumerated above will be sufficient to show how little justification there is for the claim.

[Freud's own realization of the importance of bisexuality owed much to Fliess (cf. p. 194 *n.* 2), and his forgetfulness of this fact on one occasion provided him with an example in his *Psychopathology of Everyday Life*, 1901*b*, Chapter VII (II); *RSE*, **6**. He did not, however, accept Fliess's view that bisexuality provided the explanation of repression. See Freud's discussion of this in 'A Child is Being Beaten' (1919*e*, halfway through Section VI). The whole question is gone into in detail by Kris in Section IV of his introduction to the Fliess correspondence (Freud, 1950*a*). – Freud (1891*b*; *NSW*, **4**, Chapter I), incidentally, also rejected the notion of circumscribed language 'centres' in the brain.]

structure. And, secondly, we have to deal with disturbances that affect the sexual drive in the course of its development.

Sexual Object of Inverts

The theory of psychical hermaphroditism presupposes that the sexual object of an invert is the opposite of that of a normal person. An inverted man, it holds, is like a woman in being subject to the charm that proceeds from masculine attributes both physical and mental: he feels he is a woman in search of a man.

But however well this applies to quite a number of inverts, it is, nevertheless, far from revealing a universal characteristic of inversion. There can be no doubt that a large proportion of male inverts retain the mental quality of masculinity, that they possess relatively few of the secondary characters of the opposite sex and that what they look for in their sexual object are in fact feminine mental traits. If this were not so, how would it be possible to explain the fact that male prostitutes who offer themselves to inverts – today just as they did in ancient times – imitate women in all the externals of their clothing and behaviour? Such imitation would otherwise inevitably clash with the ideal of the inverts. It is clear that in Greece, where the most masculine men were numbered among the inverts, what excited a man's love was not the *masculine* character of a boy, but his physical resemblance to a woman as well as his feminine mental qualities – his shyness, his modesty and his need for instruction and assistance. As soon as the boy became a man he ceased to be a sexual object for men and himself, perhaps, became a lover of boys. In this instance, therefore, as in many others, the sexual object is not someone of the same sex but someone who combines the characters of both sexes; there is, as it were, a compromise between an impulse [*Regung*][T] that seeks a man and one that seeks a woman, while it remains a paramount condition that the object's body (i.e. genitals) shall be masculine. Thus the sexual object is a kind of reflection of the subject's own bisexual nature.[1]

1 [This last sentence was added in 1915. – *Footnote added* 1910:] It is true that psychoanalysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but shortlived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take *themselves* as their sexual object. That is to say, proceeding from a basis of narcissism, they look for a young man who resembles themselves and whom *they* may love as their mother loved *them*. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

[145] The position in the case of women is less ambiguous; for among them the active inverts exhibit masculine characteristics, both physical and mental, with peculiar frequency and look for femininity in their sexual objects – though here again a closer knowledge of the facts might reveal greater variety.

Sexual Aim of Inverts

The important fact to bear in mind is that no one single aim can be laid down as applying in cases of inversion. Among men, intercourse *per anum* by no means coincides with inversion; masturbation is quite as [146] frequently their exclusive aim, and it is even true that restrictions of

[At this point the footnote proceeded as follows in the 1910 edition only: 'It must, however, be borne in mind that hitherto only a single type of invert has been submitted to psychoanalysis – persons whose sexual activity is in general stunted and the residue of which is manifested as inversion. The problem of inversion is a highly complex one and includes very various types of sexual activity and development. A strict conceptual distinction should be drawn between different cases of inversion according to whether the sexual character of the *object* or that of the *subject* has been inverted.']

[*Added* 1915:] Psychoanalytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force [*Motoren*] for illness, than do similar attachments to the opposite sex. On the contrary, psychoanalysis considers that a choice of an object independently of its sex – freedom to range equally over male and female objects – as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psychoanalysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object choice we have found that frustration [*Versagung*][T] (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

sexual aim – to the point of its being limited to simple outpourings of emotion – are commoner among them than among heterosexual lovers. Among women, too, the sexual aims of inverts are various: there seems to be a special preference for contact with the mucous membrane of the mouth.

[*Added* 1920:] Ferenczi (1914) has brought forward a number of interesting points on the subject of inversion. He rightly protests that, because they have in common the symptom of inversion, a large number of conditions, which are very different from one another and which are of unequal importance both in organic and psychical respects, have been thrown together under the name of 'homosexuality' (or, to follow him in giving it a better name, 'homo-erotism'). He insists that a sharp distinction should at least be made between two types: 'subject homo-erotics', who feel and behave like women, and 'object homo-erotics', who are completely masculine and who have merely exchanged a female for a male object. The first of these two types he recognizes as true 'sexual intermediates' in Hirschfeld's sense of the word; the second he describes, less happily, as obsessional neurotics [*Zwangsneurotiker*][T]. According to him, it is only in the case of object homo-erotics that there is any question of their struggling against their inclination to inversion or of the possibility of their being influenced psychologically. While granting the existence of these two types, we may add that there are many people in whom a certain quantity of subject homo-erotism is found in combination with a proportion of object homo-erotism. *Zwang*

During the last few years work carried out by biologists, notably by Steinach, has thrown a strong light on the organic determinants of homo-erotism and of sexual characters in general. By carrying out experimental castration and subsequently grafting the sex glands of the opposite sex, it was possible in the case of various species of mammals to transform a male into a female and *vice versa*. The transformation affected more or less completely both the somatic sexual characters and the psychosexual attitude (that is, both subject and object erotism). It appeared that the vehicle of the force [*Kraft*][T] which thus acted as a sex determinant was not the part of the sex gland which forms the sex cells but what is known as its interstitial tissue (the 'puberty gland'). In one case this transformation of sex was actually effected in a man who had lost his testes owing to tuberculosis. In his sexual life he behaved in a feminine manner, as a passive homosexual, and exhibited very clearly marked feminine sexual characters of a secondary kind (e.g. in regard to growth of hair and beard and deposits of fat on the breasts and hips). After an undescended testis from another male patient had been grafted into him, he began to behave in a masculine manner and to direct his libido towards women in a normal way. Simultaneously his somatic feminine characters disappeared. (Lipschütz, 1919, 356–7.)

It would be unjustifiable to assert that these interesting experiments put the theory of inversion on a new basis, and it would be hasty to expect them to offer a universal means of 'curing' homosexuality. Fliess has rightly insisted that these experimental findings do not invalidate the theory of the general bisexual disposition of the higher animals. On the contrary, it seems to me probable that further research of a similar kind will produce a direct confirmation of this presumption of bisexuality. [The Editor of the *RSE* has, with few exceptions, resisted the temptation to update biological findings that Freud refers to. In the present instance, however, it seems appropriate to remark that the 'further research' he anticipated has indeed confirmed the bisexual disposition of all mammals (including humans). The default anatomy is female, unless masculinized *in utero* by testosterone. This is produced in the testes, which are themselves intersexual gonads that would become ovaries were it not for the masculinizing action of TDF. Of particular relevance to the issues Freud discusses here is the fact that the brain is masculinized separately from the body as a whole, at a different critical period and by a slightly different process, with the result that brain and body are not necessarily equally transformed. See LeVay (1994). – Regarding Freud's opposition 'to any attempt at separating off homosexuals from the rest of mankind as a group of a special character' and the associated notion of 'curing' homosexuality, see his Statement on Homosexuality (Freud, 1905*h*), p. 313, and the appended *Rundbriefe*, pp. 311–12 below, and also his Letter on Homosexuality (1951*a* [1935]), *RSE*, **22**, 270.]

Conclusion

It will be seen that we are not in a position to base a satisfactory explanation of the origin of inversion upon the material at present before us. Nevertheless, our investigation has put us in possession of a piece of
[147] knowledge which may turn out to be of greater importance to us than the solution to that problem. It has been brought to our notice that we have been in the habit of regarding the connection between the sexual
[148] drive and the sexual object as more intimate than it, in fact, is. Experience of the cases that are considered abnormal has shown us that in them the sexual drive and the sexual object are merely soldered together – a fact which we have been in danger of overlooking in consequence of the uniformity of the normal picture, where the object appears to form part and parcel of the drive. We are thus warned to loosen the bond that exists in our thoughts between drive and object. It seems probable that the sexual drive is in the first instance independent of its object; nor is its genesis likely to be due to its object's attractions.

(B) SEXUALLY IMMATURE PERSONS AND ANIMALS AS SEXUAL OBJECTS

People whose sexual objects belong to the normally inappropriate sex – that is, inverts – strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent drive (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual drive by the fact that it permits of so much variation in its objects and such a cheapening of them – which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

One would be glad on aesthetic grounds to be able to ascribe these and other severe aberrations of the sexual drive to insanity; but that cannot be done. Experience shows that disturbances of the sexual drive

among the insane do not differ from those that occur among the healthy and in whole races or occupations. Thus the sexual abuse of children is found with uncanny frequency among schoolteachers and child attendants, simply because they have the best opportunity for it. The insane merely exhibit any such aberration to an intensified degree; or, what is [149]
particularly significant, it may become exclusive and replace normal sexual satisfaction entirely.

The very remarkable relation which thus holds between sexual variations and the descending scale from health to insanity gives us plenty of material for thought. I am inclined to believe that it may be explained by the fact that the impulses of sexual life are among those which, even normally, are the least controlled by the higher activities of the mind. In my experience anyone who is in any way, whether socially or ethically, abnormal mentally is invariably abnormal also in his sexual life. But many people are abnormal in their sexual life who in every other respect approximate to the average, and have, along with the rest, passed through the process of human cultural development, in which sexuality remains the weak spot.

The most general conclusion that follows from all these discussions seems, however, to be this. Under a great number of conditions and in surprisingly numerous individuals, the nature and importance of the sexual object recedes into the background. What is essential and constant in the sexual drive is something else.[1]

(2) DEVIATIONS IN RESPECT OF THE SEXUAL AIM

The normal sexual aim is regarded as being the union of the genitals in the act known as copulation, which leads to a release of the sexual tension and a temporary extinction of the sexual drive – a satisfaction analogous to the sating of hunger. But even in the most normal sexual process we may detect rudiments which, if they had developed, would have led to the deviations described as 'perversions'. For there are certain intermediate relations to the sexual object, such as touching and looking at it, which lie on the road towards copulation and are recognized as being preliminary sexual aims. On the one hand these activities [150]

1 [*Footnote added* 1910:] The most striking distinction between the erotic life of antiquity and our own no doubt lies in the fact that the ancients laid the stress upon the drive itself, whereas we emphasize its object. The ancients glorified the drive and were prepared on its account to honour even an inferior object; while we despise the activity of the drive in itself, and find excuses for it only in the merits of the object.

are themselves accompanied by pleasure, and on the other hand they intensify the excitation, which should persist until the final sexual aim is attained. Moreover, the kiss, one particular contact of this kind, between the mucous membrane of the lips of the two people concerned, is held in high sexual esteem among many nations (including the most highly civilized ones), in spite of the fact that the parts of the body involved do not form part of the sexual apparatus but constitute the entrance to the digestive tract. Here, then, are factors which provide a point of contact between the perversions and normal sexual life and which can also serve as a basis for their classification. Perversions are sexual activities which either (*a*) extend, in an anatomical sense, beyond the regions of the body that are designed for sexual union, or (*b*) linger over the intermediate relations to the sexual object which should normally be traversed rapidly on the path towards the final sexual aim.

(A) ANATOMICAL EXTENSIONS

Overvaluation of the Sexual Object

It is only in the rarest instances that the psychical valuation that is set on the sexual object, as being the goal of the sexual drive, stops short at its genitals. The appreciation extends to the whole body of the sexual object and tends to involve every sensation derived from it. The same overvaluation spreads over into the psychological sphere: the subject becomes, as it were, intellectually infatuated (that is, his powers of judgement are weakened) by the mental achievements and perfections of the sexual object and he submits to the latter's judgements with credulity. Thus the credulity of love becomes an important, if not the most fundamental, source of *authority*.[1]

This sexual overvaluation is something that cannot be easily reconciled with a restriction of the sexual aim to union of the actual genitals [151] and it helps to turn activities connected with other parts of the body into sexual aims.[2]

1 In this connection I cannot help recalling the credulous submissiveness shown by a hypnotized subject towards his hypnotist. This leads me to suspect that the essence of hypnosis lies in an unconscious fixation [*Fixierung*][T] of the subject's libido to the figure of the hypnotist, through the medium of the masochistic components of the sexual drive. [*Added* 1910:] Ferenczi (1909) has brought this characteristic of suggestibility into relation with the 'parental complex'. – [The relation of the subject to the hypnotist was discussed by Freud much later, in Chapter VIII of his *Group Psychology* (1921*c*), *RSE*, **18**, 106. See also below, p. 251 ff.]

2 [In the editions earlier than 1920 this paragraph ended with the further sentence: 'The emergence of these extremely various anatomical extensions clearly implies a need for variation, and this has been described by Hoche as "craving for stimulation".' The first two sentences of the

The significance of the factor of sexual overvaluation can be best studied in men, for their erotic life alone has become accessible to research. That of women – partly owing to the stunting effect of civilized conditions [*Kulturverkümmerung*][T] and partly owing to their conventional secretiveness and insincerity – is still veiled in an impenetrable obscurity.[1] *Kultur*

Sexual Use of the Mucous Membrane of the Lips and Mouth

The use of the mouth as a sexual organ is regarded as a perversion if the lips (or tongue) of one person are brought into contact with the genitals of another, but not if the mucous membranes of the lips of both of them come together. This exception is the point of contact with what is normal. Those who condemn the other practices (which have no doubt been common among mankind from primaeval times) as being perversions, are giving way to an unmistakable feeling of *disgust*, which protects them from accepting sexual aims of the kind. The limits of such disgust are, however, often purely conventional: a man who will kiss a pretty girl's lips passionately may perhaps be disgusted at the idea of using her [152] toothbrush, though there are no grounds for supposing that his own oral cavity, for which he feels no disgust, is any cleaner than the girl's. Here, then, our attention is drawn to the factor of disgust, which interferes with the libidinal overvaluation of the sexual object but can in turn be overridden by libido. Disgust seems to be one of the forces which have led to a restriction of the sexual aim. These forces do not as a rule extend to the genitals themselves. But there is no doubt that the genitals of the opposite sex can in themselves be an object of disgust and that such an attitude is one of the characteristics of all hysterics, and especially of hysterical women. The sexual drive in its strength enjoys overriding this disgust. (See below [p. 139 f.].)

footnote which follows were added in 1915, before which date it had begun with the sentence: 'Further consideration leads me to conclude that I. Bloch has overestimated the theoretical importance of the factor of craving for stimulation.' The whole footnote and the paragraph in the text above were recast in their present form in 1920:] It must be pointed out, however, that sexual overvaluation is not developed in the case of *every* mechanism of object choice. We shall become acquainted later on with another and more direct explanation of the sexual role assumed by the other parts of the body. The factor of 'craving for stimulation' has been put forward by Hoche and Bloch as an explanation of the extension of sexual interest to parts of the body other than the genitals; but it does not seem to me to deserve such an important place. The various channels along which the libido passes are related to each other from the very first like intercommunicating pipes, and we must take the phenomenon of collateral flow into account. [See p. 151 f. below.]

1 [*Footnote added* 1920:] In typical cases women fail to exhibit any sexual overvaluation towards men; but they scarcely ever fail to do so towards their own children.

Sexual Use of the Anal Orifice

Where the anus is concerned it becomes still clearer that it is disgust which stamps that sexual aim as a perversion. I hope, however, I shall not be accused of partisanship when I assert that people who try to account for this disgust by saying that the organ in question serves the function of excretion and comes in contact with excrement – a thing which is disgusting in itself – are not much more to the point than hysterical girls who account for their disgust at the male genital by saying that it serves to void urine.

The playing of a sexual part by the mucous membrane of the anus is by no means limited to intercourse between men: preference for it is in no way characteristic of inverted feeling. On the contrary, it seems that *paedicatio* with a male owes its origin to an analogy with a similar act performed with a woman; while mutual masturbation is the sexual aim most often found in intercourse between inverts.

Significance of Other Regions of the Body

The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual drive, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous
[153] membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual drive and that it is fulfilled in the symptomatology of certain pathological states.

Unsuitable Substitutes for the Sexual Object – Fetishism

There are some cases which are quite specially remarkable – those in which the normal sexual object is replaced with another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual drive among the deviations in respect of the sexual *object*. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent.

What is substituted for the sexual object is some part of the body (such as the foot or hair) which is in general very inappropriate for sexual purposes, or some inanimate object which bears an assignable relation to the person whom it replaces and preferably to that person's sexuality (e.g. a piece of clothing or underlinen). Such substitutes are with some justice likened to the fetishes in which savages believe that their gods are embodied.

A transition to those cases of fetishism in which the sexual aim, whether normal or perverse, is entirely abandoned is afforded by other cases in which the sexual object is required to fulfil a fetishistic condition – such as the possession of some particular hair colouring or clothing, or even some bodily defect – if the sexual aim is to be attained. No other variation of the sexual drive that borders on the pathological can lay so much claim to our interest as this one, such is the peculiarity of the phenomena to which it gives rise. Some degree of diminution in the urge towards the normal sexual aim (an executive weakness of the sexual apparatus) seems to be a necessary precondition in every case.[1] The point of contact with the normal is provided by the psychologically essential [154] overvaluation of the sexual object, which inevitably extends to everything that is associated with it. A certain degree of fetishism is thus habitually present in normal love, especially in those stages of it in which the normal sexual aim seems unattainable or its fulfilment prevented:

> Schaff' mir ein Halstuch von ihrer Brust,
> Ein Strumpf band meiner Liebeslust![2]

The situation only becomes pathological when the longing for the fetish passes beyond the point of being merely a necessary condition attached to the sexual object and actually *takes the place* of the normal aim, and, further, when the fetish becomes detached from a particular individual and becomes the *sole* sexual object. These are, indeed, the general conditions under which mere variations of the sexual drive pass over into pathological aberrations.

Binet (1888) was the first to maintain (what has since been confirmed by a quantity of evidence) that the choice of a fetish is an after-effect of

1 [*Footnote added* 1915:] This weakness would represent the *constitutional* precondition. Psychoanalysis has found that the phenomenon can also be *accidentally* determined, by the occurrence of an early deterrence from sexual activity owing to fear, which may divert the subject from the normal sexual aim and encourage him to seek a substitute for it.

2 [Get me a kerchief from her breast,
A garter that her knee has pressed.
Goethe, *Faust*, Part I, Scene 7. (Trans. Bayard Taylor.)]

some sexual impression, received as a rule in early childhood. (This may be brought into line with the proverbial durability of first loves: *on revient toujours à ses premiers amours*.) This derivation is particularly obvious in cases where there is merely a fetishistic condition attached to the sexual object. We shall come across the importance of early sexual impressions again in another connection [p. 214 below].[1]

[155] In other cases the replacement of the object by a fetish is determined by a symbolic connection of thought, of which the person concerned is usually not conscious. It is not always possible to trace the course of these connections with certainty. (The foot, for instance, is an age-old sexual symbol which occurs even in mythology;[2] no doubt the part played by fur as a fetish owes its origin to an association with the hair of the *mons Veneris*.) Nonetheless, even symbolism such as this is not always unrelated to sexual experiences in childhood.[3]

1 [*Footnote added* 1920:] Deeper-going psychoanalytic research has raised a just criticism of Binet's assertion. All the observations dealing with this point have recorded a first meeting with the fetish at which it already aroused sexual interest without there being anything in the accompanying circumstances to explain the fact. Moreover, all of these 'early' sexual impressions relate to a time after the age of five or six, whereas psychoanalysis makes it doubtful whether fresh pathological fixations can occur so late as this. The true explanation is that behind the first recollection of the fetish's appearance there lies a submerged and forgotten phase of sexual development. The fetish, like a 'screen memory' ['*Deckerinnerung*']T, represents this phase and is thus a remnant and precipitate of it. The fact that this early infantile phase turns in the direction of fetishism, as well as the choice of the fetish itself, are constitutionally determined.

2 [*Footnote added* 1910:] The shoe or slipper is a corresponding symbol of the *female* genitals.

3 [*Footnote added* 1910:] Psychoanalysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a coprophilic pleasure in smelling which has disappeared owing to repression [*Verdrängung*]T. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 173): the foot represents a woman's penis, the absence of which is deeply felt. [*Added* 1915:] In a number of cases of foot fetishism it has *Schaulust* been possible to show that the scopophilic drive [*Schautrieb*]T, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood) being imagined as male ones. – [The importance of the repression of pleasure in smell had been indicated by Freud in two letters to Fliess of January 11 and November 14, 1897 (Freud, 1950*a*, Letters 55 and 75). He returned to the subject at the end of his analysis of the 'Rat Man' (Freud, 1909*d*), *RSE*, **10**, 187–8, and discussed it at considerable length in two long footnotes to Chapter IV of *Civilization and its Discontents* (1930*a*), ibid., **21**, 90–1 *n.* and 95–6 *n.* 3. The topic of fetishism was further considered in Freud's paper on that subject (1927*e*), ibid., **21**, 137 ff., and again still later in a posthumously published fragment on the splitting of the ego (1940*e* [1938]), ibid., **23**, 251, and in Chapter VIII of his *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 183–4.]

(B) FIXATIONS OF PRELIMINARY SEXUAL AIMS

Appearance of New Aims

Every external or internal factor that hinders or postpones the attainment of the normal sexual aim (such as impotence, the high price of the sexual object or the danger of the sexual act) will evidently lend support [156]
to the tendency to linger over the preparatory activities and to turn them into new sexual aims that can take the place of the normal one. Attentive examination always shows that even what seem to be the strangest of these new aims are already hinted at in the normal sexual process.

Touching and Looking

A certain amount of touching is indispensable (at all events among human beings) before the normal sexual aim can be attained. And everyone knows what a source of pleasure on the one hand and what an influx of fresh excitation [*Erregung*][T] on the other is afforded by tactile sensations of the skin of the sexual object. So that lingering over the stage of touching can scarcely be counted a perversion, provided that in the long run the sexual act is carried further.

The same holds true of seeing – an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway – if such a teleological form of statement is permissible[1] – when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.[2] It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual [157]

1 [The words in this parenthesis were added in 1915. Cf. p. 163 *n.* 2 and p. 167 *n.* 1 below.]

2 [This seems to be Freud's first published use of the term 'sublimate', though it occurs as early as May 2, 1897, in the Fliess correspondence (Freud, 1950*a*, Letter 61). It also appears in the 'Dora' case history, 1905*e*, actually published later than the present work (this volume, pp. 46 and 103) though drafted in 1901. The concept is further discussed below on p. 158 f. – *Footnote added* 1915:] There is to my mind no doubt that the concept of 'beautiful' has its roots in sexual excitation and that its original meaning was 'sexually stimulating' ('attractive'). [Here there is an allusion in the original to the fact that the German word '*Reiz*' is commonly used both as the technical term for 'stimulus' and, in ordinary language, as an equivalent to the English 'appeal' or 'attraction'.] This is related to the fact that we never regard the genitals themselves, the sight of which produces the strongest sexual excitation, as really 'beautiful'. [See also p. 167 *n.* 1.]

tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking [scopophilia] becomes a perversion (*a*) if it is restricted exclusively to the genitals, or (*b*) if it is connected with the overriding of disgust (as in the case of voyeurs or people who look on at excretory functions), or (*c*) if, instead of being *preparatory* to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses,[1] exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.[2]

In the perversions which are directed towards looking and being looked at, we come across a very remarkable characteristic with which we shall be still more intensely concerned in the aberration that we shall consider next: in these perversions the sexual aim occurs in two forms, an *active* and a *passive* one.

The force which opposes scopophilia [*Schaulust*], but which may be overridden by it (in a manner parallel to what we have previously seen in the case of disgust), is *shame*.

Sadism and Masochism

The most common and the most significant of all the perversions – the desire to inflict pain upon the sexual object, and its reverse – received from Krafft-Ebing the names of 'sadism' and 'masochism' for its active and passive forms respectively. Other writers [e.g. Schrenck-Notzing (1899)] have preferred the narrower term 'algolagnia'. This emphasizes the pleasure in *pain*, the cruelty; whereas the names chosen by Krafft-Ebing bring into prominence the pleasure in any form of humiliation or subjection.

As regards active algolagnia, sadism, the roots are easy to detect in the normal. The sexuality of most male human beings contains an element
[158] of *aggressiveness* – a desire to subjugate; the biological significance of it seems to lie in the need for overcoming the resistance of the sexual object by means other than the process of wooing. Thus sadism would correspond to an aggressive component of the sexual drive which has become

1 [In the editions before 1924 this read 'of a single analysis'.]

2 [*Footnote added* 1920:] Under analysis, these perversions – and indeed most others – reveal a surprising variety of motives and determinants. The compulsion to exhibit, for instance, is also closely dependent on the castration complex: it is a means of constantly insisting upon the integrity of the subject's own (male) genitals and it reiterates his infantile satisfaction at the absence of a penis in those of women. [Cf. p. 173 below.]

independent and exaggerated and, by displacement [*Verschiebung*][T], has usurped the leading position.[1]

In ordinary speech the connotation of sadism oscillates between, on the one hand, cases merely characterized by an active or violent attitude to the sexual object, and, on the other hand, cases in which satisfaction is entirely conditional on the humiliation and maltreatment of the object. Strictly speaking, it is only this last extreme instance which deserves to be described as a perversion.

Similarly, the term masochism comprises any passive attitude towards sexual life and the sexual object, the extreme instance of which appears to be that in which satisfaction is conditional upon suffering physical or mental pain at the hands of the sexual object. Masochism, in the form of a perversion, seems to be further removed from the normal sexual aim than its counterpart; it may be doubted at first whether it can ever occur as a primary phenomenon or whether, on the contrary, it may not invariably arise from a transformation of sadism.[2] It can often be shown that masochism is nothing more than an extension of sadism turned round upon the subject's own self, which thus, to begin with, takes the place of the sexual object. Clinical analyses of extreme cases of masochistic perversion show that a great number of factors (such as the castration complex and the sense of guilt) have combined to exaggerate and fixate the original passive sexual attitude.

Pain, which is overridden in such cases, thus falls into line with [159]
disgust and shame as a force that stands in opposition and resistance to the libido.[3]

Sadism and masochism occupy a special position among the perversions, since the contrast between activity and passivity which lies behind them is among the universal characteristics of sexual life.

The history of human civilization [*Kulturgeschichte*] shows beyond any doubt that there is an intimate connection between cruelty and

1 [In the editions of 1905 and 1910 the following two sentences appeared in the text at this point: 'One at least of the roots of masochism can be inferred with equal certainty. It arises from sexual overvaluation as a necessary psychical consequence of the choice of a sexual object.' From 1915 onwards these sentences were omitted and the next two paragraphs were inserted in their place.]

2 [*Footnote added* 1924:] My opinion of masochism has been to a large extent altered by later reflection, based upon certain hypotheses as to the structure of the apparatus of the mind and the classes of drives operating in it. I have been led to distinguish a primary or *erotogenic* masochism, out of which two later forms, *feminine* and *moral* masochism, have developed. Sadism which cannot find employment in actual life is turned round upon the subject's own self and so produces a *secondary* masochism, which is superadded to the primary kind. (Cf. Freud, 1924*c* [*RSE*, **19**, 161].)

3 [This short paragraph was in the first edition (1905), but the last two, as well as the next one, were only added in 1915.]

the sexual drive; but nothing has been done towards explaining the connection, apart from laying emphasis on the aggressive factor in the libido. According to some authorities this aggressive element of the sexual drive is in reality a relic of cannibalistic desires – that is, it is a contribution derived from the apparatus for obtaining mastery [*Bemächtigungsapparates*], which is concerned with the satisfaction of the other and, ontogenetically, the older of the great needs.[1] It has also been maintained that every pain contains in itself the possibility of a feeling of pleasure. All that need be said is that no satisfactory explanation of this perversion has been put forward and that it seems possible that a number of mental impulses are combined in it to produce a single resultant.[2]

But the most remarkable feature of this perversion is that its active and passive forms are habitually found to occur together in the same individual. A person who feels pleasure in producing pain in someone else in a sexual relationship is also capable of enjoying as pleasure any pain which he may himself derive from sexual relations. A sadist is always at the same time a masochist, although the active or the passive aspect of the perversion may be the more strongly developed in him and may represent his predominant sexual activity.[3]

[160] We find, then, that certain among the tendencies to perversion occur regularly as pairs of opposites; and this, taken in conjunction with material which will be brought forward later, has a high theoretical significance.[4] It is, moreover, a suggestive fact that the existence of the pair of opposites formed by sadism and masochism cannot be attributed merely to the element of aggressiveness. We should rather be inclined to connect the simultaneous presence of these opposites with the opposing masculinity and femininity which are combined in bisexuality – a contrast which often has to be replaced in psychoanalysis with that between activity and passivity.[5]

1 [*Footnote added* 1915:] Cf. my remarks below [p. 175 f.] on the pregenital phases of sexual development, which confirm this view.

2 [*Footnote added* 1924:] The enquiry mentioned above [in footnote 2, p. 141] has led me to assign a peculiar position, based upon the origin of the drives, to the pair of opposites constituted by sadism and masochism, and to place them outside the class of the remaining 'perversions'.

3 Instead of multiplying the evidence for this statement, I will quote a passage from Havelock Ellis (1903): 'The investigation of histories of sadism and masochism, even those given by Krafft-Ebing (as indeed Colin Scott and Féré have already pointed out), constantly reveals traces of both groups of phenomena in the same individual.'

4 [*Footnote added* 1915:] Cf. my discussion of 'ambivalence' below [p. 176 f.].

5 [The last clause did not occur in the 1905 or 1910 editions. In 1915 the following clause was added: 'a contrast whose significance is reduced in psychoanalysis to that between activity and passivity.' This was replaced in 1924 by the words now appearing in the text.]

(3) THE PERVERSIONS IN GENERAL

Variation and Disease

It is natural that medical men, who first studied perversions in outstanding examples and under special conditions, should have been inclined to regard them, like inversion, as indications of degeneracy or disease. Nevertheless, it is even easier to dispose of that view in this case than in that of inversion. Everyday experience has shown that most of these extensions, or at any rate the less severe of them, are constituents which are rarely absent from the sexual life of healthy people, and are judged by them no differently from other intimate events. If circumstances favour such an occurrence, normal people too can substitute a perversion of this kind for the normal sexual aim for quite a time, or can find place for the one alongside the other. No healthy person, it appears, can fail to make some addition that might be called perverse to the normal sexual aim; and the universality of this finding is in itself enough to show how inappropriate it is to use the word perversion as a term of reproach. In the sphere of sexual life we are brought up against peculiar [161] and, indeed, insoluble difficulties as soon as we try to draw a sharp line to distinguish mere variations within the range of what is physiological from pathological symptoms.

Nevertheless, in some of these perversions the quality of the new sexual aim is of a kind to demand special examination. Certain of them are so far removed from the normal in their content that we cannot avoid pronouncing them 'pathological'. This is especially so where (as, for instance, in cases of licking excrement or of intercourse with dead bodies) the sexual drive goes to astonishing lengths in successfully overriding the resistances of shame, disgust, horror or pain. But even in such cases we should not be too ready to assume that people who act in this way will necessarily turn out to be insane or subject to grave abnormalities of other kinds. Here again we cannot escape from the fact that people whose behaviour is in other respects normal can, under the domination of the most unruly of all the drives, put themselves in the category of sick persons in the single sphere of sexual life. On the other hand, manifest abnormality in the other relations of life can invariably be shown to have a background of abnormal sexual conduct.

In the majority of instances the pathological character in a perversion is found to lie not in the *content* of the new sexual aim but in its relation to the normal. If a perversion, instead of appearing merely *alongside* the

normal sexual aim and object, and only when circumstances are unfavourable to *them* and favourable to *it* – if, instead of this, it ousts them completely and takes their place in *all* circumstances – if, in short, a perversion has the characteristics of exclusiveness and fixation – then we shall usually be justified in regarding it as a pathological symptom.

The Mental Factor in the Perversions

It is perhaps in connection precisely with the most repulsive perversions that the mental factor must be regarded as playing its largest part in the transformation of the sexual drive. It is impossible to deny that in their case a piece of mental work has been performed which, in spite of its horrifying result, is the equivalent of an idealization of the drive. The omnipotence of love is perhaps never more strongly proved than in such
[162] of its aberrations as these. The highest and the lowest are always closest to each other in the sphere of sexuality: 'vom Himmel durch die Welt zur Hölle.'[1]

Two Conclusions

Our study of the perversions has shown us that the sexual drive has to struggle against certain mental forces which act as resistances, and of which shame and disgust are the most prominent. It is permissible to suppose that these forces play a part in restraining that drive within the limits that are regarded as normal; and if they develop in the individual before the sexual drive has reached its full strength, it is no doubt they that will determine the course of its development.[2]

In the second place we have found that some of the perversions which we have examined are only made intelligible if we assume the convergence of several motive forces [*Motiven*]. If such perversions admit of analysis, that is, if they can be taken to pieces, then they must be of a composite nature. This gives us a hint that perhaps the sexual drive itself

1 ['From Heaven, across the world, to Hell.'
Goethe, *Faust*, Prelude in the Theatre. (Trans. Bayard Taylor.)
In a letter to Fliess of January 3, 1897 (Freud, 1950*a*, Letter 54), Freud suggests the use of this same quotation as the motto for a chapter on 'Sexuality' in a projected volume. This letter was written at a time when he was beginning to turn his attention to the perversions. His first reference to the relation between them and the neuroses in the Fliess correspondence dates from January 1, 1896 (Draft K), *RSE*, **1**, 249. But see also Letter 21 of August 29, 1894 (ibid., **1**, 227).]

2 [*Footnote added* 1915:] On the other hand, these forces which act like dams upon sexual development – disgust, shame and morality – must also be regarded as historical precipitates of the external inhibitions to which the sexual drive has been subjected during the psychogenesis of the human race. We can observe the way in which, in the development of individuals, they arise at the appropriate moment, as though spontaneously, when upbringing and external influence give the signal.

may be no simple thing, but put together from components which have come apart again in the perversions. If this is so, the clinical observation of these abnormalities will have drawn our attention to amalgamations which have been lost to view in the uniform behaviour of normal people.[1]

(4) THE SEXUAL DRIVE IN NEUROTICS

Psychoanalysis

An important addition to our knowledge of the sexual drive in certain people who at least approximate to the normal can be obtained from a source which can only be reached in one particular way. There is only one means of obtaining exhaustive information that will not be misleading about the sexual life of the persons known as 'psychoneurotics' – sufferers from hysteria, from obsessional neurosis [*Zwangsneurose*][T], from what is wrongly described as neurasthenia, and, undoubtedly, from dementia praecox and paranoia as well.[2] They must be subjected to psychoanalytic investigation, which is employed in the therapeutic procedure introduced by Josef Breuer and myself in 1893 and known at that time as 'catharsis'. [163]

I must first explain – as I have already done in other writings – that all my experience shows that these psychoneuroses are based on sexual drive forces [*Triebkräften*]. By this I do not merely mean that the energy of the sexual drive makes a contribution to the forces that maintain the pathological manifestations (the symptoms). I mean expressly to assert that that contribution is the most important and only constant source of energy of the neurosis and that in consequence the sexual life of the persons in question is expressed – whether exclusively or principally or only partly – in these symptoms. As I have put it elsewhere [1905*e*, Postscript; this volume, p. 101 f.], the symptoms constitute the sexual activity of the patient. The evidence for this assertion is derived from the ever-increasing number of psychoanalyses of hysterical and other neurotics which I have carried out during the last 25 years[3] and of whose

1 [*Footnote added* 1920:] As regards the origin of the perversions, I will add a word in anticipation of what is to come. There is reason to suppose that, just as in the case of fetishism, abortive beginnings of normal sexual development occur before the perversions become fixated. Analytic investigation has already been able to show in a few cases that perversions are a residue of development towards the Oedipus complex and that after the repression of that complex the components of the sexual drive which are strongest in the disposition of the individual concerned emerge once more.

2 [Before 1915 the words 'probably paranoia' take the place of the last eight words of this sentence.]

3 [In 1905 '10 years', the figure being increased with each edition up to and including 1920.]

findings I have given (and shall continue to give) a detailed account in other publications.[1]

[164] The removal of the symptoms of hysterical patients by psychoanalysis proceeds on the supposition that those symptoms are substitutes – transcriptions as it were – for a number of emotionally cathected [*affekt-besetzten*][T] mental processes [*seelischen Vorgängen*][T], wishes and desires, which, by the operation of a special psychical procedure (repression [*Verdrängung*][T]), have been prevented from obtaining discharge in psychical activity that is admissible to consciousness. These mental processes, therefore, being held back in a state of unconsciousness, strive to obtain an expression that shall be appropriate to their emotional importance – to obtain discharge [*Abfuhr*][T]; and in the case of hysteria they find such an expression (by means of the process of 'conversion') in somatic phenomena, that is, in hysterical symptoms. By systematically turning these symptoms back (with the help of a special technique) into emotionally cathected ideas [*Vorstellungen*][T] – ideas that will now have become conscious – it is possible to obtain the most accurate knowledge of the nature and origin of these formerly unconscious psychical structures [*Bildungen*][T].

Besetzung, Seele

Findings of Psychoanalysis

In this manner the fact has emerged that symptoms represent a substitute for impulses the source of whose strength is derived from the sexual drive. What we know about the nature of hysterics before they fall ill – and they may be regarded as typical of all psychoneurotics – and about the occasions which precipitate their falling ill, is in complete harmony with this view. The character of hysterics shows a degree of sexual repression in excess of the normal quantity, an intensification of resistance against the sexual drive (which we have already met with in the form of shame, disgust and morality), and what seems like an instinctive [*instinktive*][T] aversion on their part to any intellectual consideration of sexual problems. As a result of this, in especially marked cases, the patients remain in complete ignorance of sexual matters right into the period of sexual maturity.[2]

Instinkt

On a cursory view, this trait, which is so characteristic of hysteria, is not uncommonly screened by the existence of a second constitutional [165] character present in hysteria, namely the predominant development of

1 [*Footnote added* 1920:] It implies no qualification of the above assertion, but rather an amplification of it, if I restate it as follows: neurotic symptoms are based on the one hand on the demands of the libidinal drives and on the other hand on those made by the ego by way of reaction to them.

2 Breuer [in the second paragraph of the first case history, Breuer & Freud, 1895*d*; *RSE*, **2**, 19] writes of the patient in connection with whom he first adopted the cathartic method: 'The factor of sexuality was astonishingly undeveloped in her.' [Breuer actually wrote 'element of sexuality'.]

the sexual drive. Psychoanalysis, however, can invariably bring the first of these factors to light and clear up the enigmatic contradiction which hysteria presents, by revealing the pair of opposites by which it is characterized – exaggerated sexual craving and excessive aversion to sexuality.

In the case of anyone who is predisposed to hysteria, the onset of his illness is precipitated when, either as a result of his own progressive maturity or of the external circumstances of his life, he finds himself faced with the demands of a real sexual situation. Between the pressure of the drive and his antagonism to sexuality, illness offers him a way of escape. It does not solve his conflict, but seeks to evade it by transforming his libidinal strivings [*libidinösen Strebungen*] into symptoms.[1] The exception is only an *apparent* one when a hysteric – a male patient, it may be – falls ill as a result of some trivial emotion, some conflict which does not centre around any sexual interest. In such cases psychoanalysis is regularly able to show that the illness has been made possible by the sexual component of the conflict, which has prevented the mental processes from reaching a normal issue.

Neurosis and Perversion

There is no doubt that a large part of the opposition to these views of mine is due to the fact that sexuality, to which I trace back psychoneurotic symptoms, is regarded as though it coincided with the normal sexual drive. But psychoanalytic teaching goes further than this. It shows that it is by no means only at the cost of the so-called *normal* sexual drive that these symptoms originate – at any rate such is not exclusively or mainly the case; they also give expression (by conversion) to drives which would be described as *perverse* in the widest sense of the word if they could be expressed directly in phantasy and action without being diverted from consciousness. Thus symptoms are formed in part at the cost of *abnormal* sexuality; *neuroses are, so to say, the negative of perversions*.[2]

1 [This theme was elaborated by Freud in his paper on the different types of onset of neurosis (1912*c*), *RSE*, **12**, 227 ff.]

2 [This idea had been expressed by Freud in precisely these terms in a letter to Fliess of January 24, 1897 (Freud, 1950*a*, Letter 57). But it had already been implied in the letters of December 6, 1896, and January 11, 1897 (Letters 52 and 55). It can also be found in the case history of 'Dora' (this volume, p. 46).] The contents of the clearly conscious phantasies of perverts (which in favourable circumstances can be transformed into manifest behaviour), of the delusional fears of paranoics (which are projected in a hostile sense on to other people) and of the unconscious phantasies of hysterics (which psychoanalysis reveals behind their symptoms) – all of these coincide with one another even down to their details. [This was already remarked on in Chapter XII of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 219 *n*. 2.]

[166] The sexual drive of psychoneurotics exhibits all the aberrations which we have studied as variations of normal, and as manifestations of abnormal, sexual life.

(*a*) The unconscious mental life of all neurotics (without exception) shows inverted impulses, fixation of their libido upon persons of their own sex. It would be impossible without deep discussion to give any adequate appreciation of the importance of this factor in determining the form taken by the symptoms of the illness. I can only insist that an unconscious tendency to inversion is never absent and is of particular value in throwing light upon hysteria in men.[1]

(*b*) It is possible to trace in the unconscious of psychoneurotics tendencies to every kind of anatomical extension of sexual activity and to show that those tendencies are factors in the formation of symptoms. Among them we find occurring with particular frequency those in which the mucous membrane of the mouth and anus are assigned the role of genitals.

(*c*) An especially prominent part is played as factors in the formation of symptoms in psychoneuroses by the component drives,[2] which emerge for the most part as pairs of opposites and which we have met with as introducing new sexual aims – the scopophilic and exhibitionistic drive [*Trieb der Schaulust und der Exhibition*] and the active and passive forms of the drive to cruelty [*Trieb zur Grausamkeit*]. The contribution made by the last of these is essential to the understanding of the fact that symptoms involve *suffering*, and it almost invariably dominates
[167] a part of the patient's social behaviour. It is also through the medium of this connection between libido and cruelty that the transformation of love into hate takes place, the transformation of affectionate into hostile impulses, which is characteristic of a great number of cases of neurosis, and indeed, it would seem, of paranoia in general.

The interest of these findings is still further increased by certain special facts.[3]

1 Psychoneuroses are also very often associated with *manifest* inversion. In such cases the heterosexual current of feeling has undergone complete suppression. It is only fair to say that my attention was first drawn to the necessary universality of the tendency to inversion in psychoneurotics by Wilhelm Fliess of Berlin, after I had discussed its presence in individual cases. – [*Added* 1920:] This fact, which has not been sufficiently appreciated, cannot fail to have a decisive influence on any theory of homosexuality.

2 [The term 'component drive' [*Partialtriebe*] here makes its first appearance in Freud's published works, though the *concept* has already been introduced above on p. 144 f.]

3 [In the editions before 1920 *three* such 'special facts' were enumerated. The first, which was subsequently omitted, ran as follows: 'Among the unconscious trains of thought found in neuroses there is nothing corresponding to a tendency to fetishism – a circumstance which throws light on the psychological peculiarity of this well-understood perversion.']

(α) Whenever we find in the unconscious a drive of this sort which is capable of being paired off with an opposite one, this second drive will regularly be found in operation as well. Every active perversion is thus accompanied by its passive counterpart: anyone who is an exhibitionist in his unconscious is at the same time a voyeur; in anyone who suffers from the consequences of repressed sadistic impulses there is sure to be another determinant of his symptoms which has its source in masochistic inclinations. The complete agreement which is here shown with what we have found to exist in the corresponding 'positive' perversions is most remarkable, though in the actual symptoms one or other of the opposing tendencies plays the predominant part.

(β) In any fairly marked case of psychoneurosis it is unusual for only a single one of these perverse drives to be developed. We usually find a considerable number and as a rule traces of them all. The degree of development of each particular drive is, however, independent of that of the others. Here, too, the study of the 'positive' perversions provides an exact counterpart.

(5) COMPONENT DRIVES AND EROTOGENIC ZONES[1]

If we put together what we have learnt from our investigation of positive and negative perversions, it seems plausible to trace them back to a num- [168]
ber of 'component drives', which, however, are not of a primary nature, but are susceptible to further analysis.[2] By a 'drive' is provisionally to be understood the psychical representative [*Repräsentanz*] of an endosomatic, continuously flowing source of stimulation, as contrasted with a 'stimulus' [*Reiz*], which is set up by *single* excitations coming from *without*. The concept of drive is thus one of those lying on the frontier between the mental and the physical. The simplest and likeliest

1 [This appears to be the first published occurrence of the term 'erotogenic zone' [*erogene Zonen*]. Freud had already used it in a letter to Fliess on December 6, 1896 (Freud, 1950*a*, Letter 52). It also occurs in a passage (this volume, p. 47) in Section I of the case history of 'Dora' (1905*e*), presumably written in 1901. It was evidently constructed on the analogy of the term 'hysterogenic zone' which was already in common use. Cf. the case of male hysteria (1886*d*) and 'Hysteria' (1888*b*), *NSW*, **4**; *RSE*, **1**, 30 and 45 f.]

2 [The passage from this point till the end of the paragraph dates from 1915. In the first two editions (1905 and 1910) the following sentences appeared instead: 'We can distinguish in them [the component drives] (in addition to a "drive" which is not itself sexual and which has its source in motor impulses) a contribution from an organ capable of receiving stimuli (e.g. the skin, the mucous membrane or a sense organ). An organ of this kind will be described in this connection as an "erotogenic zone" – as being the organ whose excitation lends the drive a sexual character.' – The revised version dates from the period of Freud's paper on 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, where the whole topic is examined at length.]

assumption as to the nature of drives would seem to be that in itself a drive is without quality, and, so far as mental life is concerned, is only to be regarded as a measure of the demand made upon the mind for work. What distinguishes the drives from one another and endows them with specific qualities is their relation to their somatic sources and to their aims. The source of a drive is a process of excitation occurring in an organ and the immediate aim of the drive lies in the removal of this organic stimulus.[1]

There is a further provisional assumption that we cannot escape in the theory of the drives. It is to the effect that excitations of two kinds arise from the somatic organs, based upon differences of a chemical nature. One of these kinds of excitation we describe as being specifically sexual, and we speak of the organ concerned as the 'erotogenic zone' of the sexual component drive arising from it.[2]

[169] The part played by the erotogenic zones is immediately obvious in the case of those perversions which assign a sexual significance to the oral and anal orifices. These behave in every respect like a portion of the sexual apparatus. In hysteria these parts of the body and the neighbouring tracts of mucous membrane become the seat of new sensations and of changes in innervation – indeed, of processes that can be compared to erection[3] – in just the same way as do the actual genitalia under the excitations of the normal sexual processes.

The significance of the erotogenic zones as apparatuses subordinate to the genitals and as substitutes for them is, among all the psychoneuroses, most clearly to be seen in hysteria; but this does not imply that that significance is any the less in the other forms of illness. It is only that in them it is less recognizable, because in their case (obsessional neurosis and paranoia) the formation of the symptoms takes place in regions of the mental apparatus which are more remote from the particular centres concerned with somatic control. In obsessional neurosis what is more striking is the significance of those impulses which create new sexual aims and seem independent of erotogenic zones. Nevertheless, in scopophilia and exhibitionism the eye corresponds to an erotogenic zone; while in the case of those components of the sexual drive which involve

1 [*Footnote added* 1924:] The theory of the drives is the most important but at the same time the least complete portion of psychoanalytic theory. I have made further contributions to it in my later works *Beyond the Pleasure Principle* (1920*g*) and *The Ego and the Id* (1923*b*).

2 [*Footnote added* 1915:] It is not easy in the present place to justify these assumptions, derived as they are from the study of a particular class of neurotic illness. But on the other hand, if I omitted all mention of them, it would be impossible to say anything of substance about the drives.

3 [The phrase in parentheses was added in 1920.]

pain and cruelty the same role is assumed by the skin – the skin, which in particular parts of the body has become differentiated into sense organs or modified into mucous membrane, and is thus the erotogenic zone *par excellence*.[1]

(6) REASONS FOR THE APPARENT PREPONDERANCE OF PERVERSE SEXUALITY IN THE PSYCHONEUROSES

[170] The preceding discussion may perhaps have placed the sexuality of psychoneurotics in a false light. It may have given the impression that, owing to their disposition, psychoneurotics approximate closely to perverts in their sexual behaviour and are proportionately remote from normal people. It may indeed very well be that the constitutional disposition of these patients (apart from their exaggerated degree of sexual repression and the excessive intensity of their sexual drive) includes an unusual tendency to perversion, using that word in its widest sense. Nevertheless, investigation of comparatively slight cases shows that this last assumption is not absolutely necessary, or at least that in forming a judgement on these pathological developments there is a factor to be considered which weighs in the other direction. Most psychoneurotics only fall ill after the age of puberty as a result of the demands made upon them by normal sexual life. (It is most particularly against the latter that repression is directed.) Or else illnesses of this kind set in later, when the libido fails to obtain satisfaction along normal lines. In both these cases the libido behaves like a stream whose main bed has become blocked. It proceeds to fill up collateral channels which may hitherto have been empty. Thus, in the same way, what appears to be the strong tendency (though, it is true, a negative one) of psychoneurotics to perversion may be collaterally determined, and must, in any case, be collaterally intensified. The fact is that we must put sexual repression as an internal factor alongside such external factors as limitation of freedom, inaccessibility of a normal sexual object, the dangers of the normal sexual act, etc., which bring about perversions in persons who might perhaps otherwise have remained normal.

1 We are reminded at this point of Moll's analysis of the sexual drive into a drive to 'contrectation' and a 'detumescence' drive. Contrectation represents a need for contact with the skin. [The detumescence drive was described by Moll (1898) as an impulse for the spasmodic relief of tension of the sexual organs, and the contrectation drive as an impulse to come into contact with another person. He believed that the latter impulse arose later than the first in the individual's development. (See also below, p. 160 *n.* 2.) – The following additional sentence appeared at the end of this footnote in 1905 and 1910, but was afterwards omitted: 'Strohmayer has very rightly inferred from a case under his observation that obsessive self-reproaches originate from suppressed sadistic impulses.']

In this respect different cases of neurosis may behave differently: in one case the preponderating factor may be the innate strength of the tendency to perversion, in another it may be the collateral increase of that tendency owing to the libido being forced away from a normal sexual aim and sexual object. It would be wrong to represent as opposition what is in fact a cooperative relation. Neurosis will always produce its greatest effects when constitution and experience work together in the
[171] same direction. Where the constitution is a marked one it will perhaps not require the support of actual experiences; while a great shock in real life will perhaps bring about a neurosis even in an average constitution. (Incidentally, this view of the relative aetiological importance of what is innate and what is accidentally experienced applies equally in other fields.)

If we prefer to suppose, nevertheless, that a particularly strongly developed tendency to perversion is among the characteristics of psychoneurotic constitutions, we have before us the prospect of being able to distinguish a number of such constitutions according to the innate preponderance of one or the other of the erotogenic zones or of one or the other of the component drives. The question whether a special relation holds between the perverse disposition and the particular form of illness adopted has, like so much else in this field, not yet been investigated.

(7) INTIMATION OF THE INFANTILE CHARACTER OF SEXUALITY

By demonstrating the part played by perverse impulses in the formation of symptoms in the psychoneuroses, we have quite remarkably increased the number of people who might be regarded as perverts. It is not only that neurotics in themselves constitute a very numerous class, but it must also be considered that an unbroken chain bridges the gap between the neuroses in all their manifestations and normality. After all, Moebius could say with justice that we are all to some extent hysterics. Thus the extraordinarily wide dissemination of the perversions forces us to suppose that the disposition to perversions is itself of no great rarity but must form a part of what passes as the normal constitution.

It is, as we have seen, debatable whether the perversions go back to innate determinants or arise, as Binet assumed was the case with fetishism [p. 137 f. above], owing to chance experiences. The conclusion now presents itself to us that there is indeed something innate lying behind

the perversions but that it is something innate in *everyone*, though as a disposition it may vary in its intensity and may be increased by the influences of actual life. What is in question are the innate constitutional roots of the sexual drive. In one class of cases (the perversions) these roots may grow into the actual vehicles of sexual activity; in others they [172]
may be submitted to an insufficient suppression (repression) and thus be able in a roundabout way to attract a considerable proportion of sexual energy to themselves as symptoms; while in the most favourable cases, which lie between these two extremes, they may by means of effective restriction and other kinds of modification bring about what is known as normal sexual life.

We have, however, a further reflection to make. This postulated constitution, containing the germs of all the perversions, will only be demonstrable in *children*, even though in them it is only with modest degrees of intensity that any of the drives can emerge. A formula begins to take shape which lays it down that the sexuality of neurotics has remained in, or been brought back to, an infantile state. Thus our interest turns to the sexual life of children, and we will now proceed to trace the play of influences which govern the evolution of infantile sexuality [*kindlichen Sexualität*] till its outcome in perversion, neurosis or normal sexual life.

II
INFANTILE SEXUALITY

Neglect of the Infantile Factor

[173] One feature of the popular view of the sexual drive is that it is absent in childhood and only awakens in the period of life described as puberty. This, however, is not merely a simple error but one that has had grave consequences, for it is mainly to this idea that we owe our present ignorance of the fundamental conditions of sexual life. A thorough study of the sexual manifestations of childhood would probably reveal the essential characters of the sexual drive and would show us the course of its development and the way in which it is put together from various sources.

It is noticeable that writers who concern themselves with explaining the characteristics and reactions of the adult have devoted much more attention to the primaeval period which is comprised in the life of the individual's ancestors – have, that is, ascribed much more influence to heredity – than to the other primaeval period, which falls within the lifetime of the individual himself – that is, to childhood. One would surely have supposed that the influence of this latter period would be easier to understand and could claim to be considered before that of heredity.[1] It is true that in the literature of the subject one occasionally comes across remarks upon precocious sexual activity in small children – upon erections, masturbation and even activities resembling coitus. But these are always quoted only as exceptional events, as oddities or as horrifying instances of precocious depravity. So far as I know, not a single author has clearly recognized the regular existence of a sexual drive in childhood; and in the writings that have become so numerous on the development of children, the chapter on 'Sexual Development' is as a rule omitted.[2]

1 [*Footnote added* 1915:] Nor is it possible to estimate correctly the part played by heredity until the part played by childhood has been assessed.

2 The assertion made in the text has since [*nachträglich*] struck me myself as being so bold that I have undertaken the task of testing its validity by looking through the literature once more. The outcome of this is that I have allowed my statement to stand unaltered. The scientific examination of both the physical and mental phenomena of sexuality in childhood is still in its

Infantile Amnesia

The reason for this strange neglect is to be sought, I think, partly in con- [174]
siderations of propriety, which the authors obey as a result of their own upbringing, and partly in a psychological phenomenon which has itself hitherto eluded explanation. What I have in mind is the peculiar amnesia which, in the case of most people, though by no means all, hides the earliest beginnings of their childhood up to their sixth or eighth year. Hitherto it has not occurred to us to feel any astonishment at the fact of this amnesia, though we might have had good grounds for doing so. For we learn from other people that during these years, of which at a later date we retain nothing in our memory but a few unintelligible and fragmentary recollections, we reacted in a lively manner to impressions, that we were capable of expressing pain and joy in a human fashion, that we gave evidence of love, jealousy and other passionate feelings by which we were strongly moved at the time, and even that we gave utterance to remarks which were regarded by adults as good evidence of our possessing insight and the beginnings of a capacity for judgement. And [175]
of all this we, when we are grown up, have no knowledge of our own! Why should our memory lag so far behind the other activities of our minds? We have, on the contrary, good reason to believe that there is no period at which the capacity for receiving and reproducing impressions is greater than precisely during the years of childhood.[1]

On the other hand, we must assume, or we can convince ourselves by a psychological examination of other people, that the very same impressions that we have forgotten have nonetheless left the deepest traces on

earliest beginnings. One writer, Bell (1902, 327), remarks: 'I know of no scientist who has given a careful analysis of the emotion as it is seen in the adolescent.' Somatic sexual manifestations from the period before puberty have only attracted attention in connection with phenomena of degeneracy and as indications of degeneracy. In none of the accounts which I have read of the psychology of this period of life is a chapter to be found on the erotic life of children; and this applies to the well-known works of Preyer [1882], Baldwin (1895), Pérez (1886), Strümpell (1899), Groos (1904), Heller (1904), Sully (1895) and others. We can obtain the clearest impression of the state of things in this field today from the periodical *Die Kinderfehler* from 1896 onwards. Nevertheless, the conviction is borne in upon us that the existence of love in childhood stands in no need of discovery. Pérez (1886, 272 ff.) argues in favour of its existence. Groos (1899, 326) mentions as a generally recognized fact that 'some children are already accessible to sexual impulses at a very early age and feel an urge to have contact with the opposite sex'. The earliest instance of the appearance of 'sex love' recorded by Bell (1902, 330) concerns a child in the middle of his third year. On this point compare further Havelock Ellis (1903, Appendix B).

[*Added* 1910:] This judgement upon the literature of infantile sexuality need no longer be maintained since the appearance of Stanley Hall's exhaustive work (1904). No such modification is necessitated by Moll's recent book (1909). See, on the other hand, Bleuler (1908). [*Added* 1915:] Since this was written, a book by Hug-Hellmuth (1913*b*) has taken the neglected sexual factor fully into account.

1 I have attempted to solve one of the problems connected with the earliest memories of childhood in a paper on 'Screen Memories' (1899*a*) [*RSE*, **3**, 295 ff.]. [*Added* 1924:] See also Chapter IV of my *Psychopathology of Everyday Life* (1901*b*) [ibid., **6**, 38].

our minds and have had a determining effect upon the whole of our later development. There can, therefore, be no question of any real abolition of the impressions of childhood, but rather of an amnesia similar to that which neurotics exhibit for later events, and of which the essence consists in a simple withholding of these impressions from consciousness, viz. in their repression. But what are the forces which bring about this repression of the impressions of childhood? Whoever could solve this riddle would, I think, have explained *hysterical* amnesia as well.

Meanwhile we must not fail to observe that the existence of infantile amnesia provides a new point of comparison between the mental states of children and psychoneurotics. We have already [p. 153 above] come across another such point in the formula to which we were led, to the effect that the sexuality of psychoneurotics has remained at, or been carried back to, an infantile stage. Can it be, after all, that infantile amnesia, too, is to be brought into relation with the sexual impulses of childhood?

Moreover, the connection between infantile and hysterical amnesia is more than a mere play upon words. Hysterical amnesia, which occurs at the bidding of repression, is only explicable by the fact that the subject is already in possession of a store of memory traces which have been withdrawn from conscious disposal, and which are now, by an associative link, attracting to themselves the material which the forces of repression
[176] are engaged in repelling from consciousness.[1] It may be said that without infantile amnesia there would be no hysterical amnesia.

I believe, then, that infantile amnesia, which turns everyone's childhood into something like a prehistoric epoch and conceals from him the beginnings of his own sexual life, is responsible for the fact that in general no importance is attached to childhood in the development of sexual life. The gaps in our knowledge which have arisen in this way cannot be bridged by a single observer. As long ago as in the year 1896[2] I insisted on the significance of the years of childhood in the origin of certain important phenomena connected with sexual life, and since then I have never ceased to emphasize the part played in sexuality by the infantile factor.

1 [*Footnote added* 1915:] The mechanism of repression cannot be understood unless account is taken of *both* of these two concurrent processes. They may be compared with the manner in which tourists are conducted to the top of the Great Pyramid of Giza by being pushed from one direction and pulled from the other. [Cf. Freud's paper on 'Repression' (1915*d*), *RSE*, **14**, 129 ff. Cf. Freud (1950*a*), Letter 84 of March 10, 1898.]

2 [E.g. in the last paragraph of Section I of his paper on the aetiology of hysteria (1896*c*), *RSE*, **3**, 208–9.]

[I] THE PERIOD OF SEXUAL LATENCY IN CHILDHOOD AND ITS INTERRUPTIONS

The remarkably frequent reports of what are described as irregular and exceptional sexual impulses in childhood, as well as the uncovering in neurotics of what have hitherto been unconscious memories of childhood, allow us to sketch out the sexual occurrences of that period in some such way as this.[1]

There seems no doubt that germs of sexual impulses are already present in the newborn child and that these continue to develop for a time, but are then overtaken by a progressive process of suppression; this in turn is itself interrupted by periodical advances in sexual development or may be held up by individual peculiarities. Nothing is known for certain concerning the regularity and periodicity of this oscillating course of development. It seems, however, that the sexual life of children usu- [177]
